## PREFACE TO VOLUME II.

---

Although nearly the entire globe has been netted by the wires of the Telegraph, and the ocean beds are traversed by cables—these new highways of the world's thoughts, the marvel of their achievements in the service rendered to mankind, is still a subject of just-admiration and wonder. The Telegraph is the highest, richest, gift of modern science yet made to mankind. It must long remain a miracle which even its daily use, and our familiarity with its outside structure, will fail to dispossess of its charm and wonder. The character of its chief agent, its subtlety, its swiftness, its certainty, its connection with the sustentation of human life, indeed of all life and matter, its capacity of application to a thousand useful and remedial purposes, and the hope which its performances inspire of future possibilities, give to the electric telegraph a sacred affinity to the power which rules the universe of which electricity and magnetism may be the reins. This mighty electric agent reveals itself everywhere, in the earth, in the sky, in the water, flitting up mountain sides, and crashing among the forest trees, asleep in all forms of matter, sweeping up in brilliant flashes of light into the sky and illuminating with an added grandeur the "infinite meadows of heaven." This agent man has harnessed to do his bidding. It blasts rocks, it makes the sunbeam a painter, it dissolves the precious metals, it gilds our household jewels, it has become the police of empires, it is the right hand of war, it has become the hunter of thieves and the protector of our homes, it is the harbinger of union and universal peace.

The JOURNAL OF THE TELEGRAPH recognizes in the presence of such an agent upon the earth a call for its work. It commenced that work feebly, and in doubt of its own capacity to accomplish its self-appointed mission. It still feels far behind its subject, yet aims to be and determines to be serviceable in its illustration and purity. It recognizes the need of high character to fulfil the trust given to the Telegraph of transmitting the world's thoughts; the necessity of preserving it from governmental espionage and domination, of enlisting the purest and best men in its management and control; of accommodating its terms so as to lead to its enlarged employment by all classes; of stimulating invention to increase its effectiveness and enlarge satisfaction in its wondrous and beneficent work. This second volume, we think, bears some evidence of this recognition. We close the year's duties with gratitude and hope. We rejoice at all the progress in the earth's union by these cords of fire which has marked the year now expiring. We are grateful, also, for our own reception by the thousands to whom the JOURNAL comes. It is a stimulus to new efforts to do more and better in days to come. This is our design. We ask aid from all sources. Practical thoughts, correct information, genial personal items, fraternal communications, stimulants to honorable and effective labor, invention and its offspring, will be all welcome. With this invitation we kiss our hand to the closing and the opening year, bidding adieu to the one and welcome to the other.

# JOURNAL OF THE TELEGRAPH.

NO. I.

NEW YORK, DECEMBER 2, 1867.

VOL. 1.

## ELECTRICAL CONDITION OF THE GLOBE.

BY A. DE LA RIVE.

It is at present generally admitted that in the normal condition the atmosphere is charged with positive electricity, and that the electricity increases from the ground (where it is almost zero), to the greatest height which can be attained. The terrestrial globe, on the contrary, is charged with negative electricity, as is proved by a variety of observations, direct and indirect. It is, moreover, a consequence of the presence of positive electricity in the atmosphere, for one of the electricities cannot manifest itself in the free state without the appearance of an equal quantity of the other kind.

At the place where the atmospheric air and the solid or liquid surface of the terrestrial globe are in contact, there is a layer of air in the neutral state, the two electricities neutralizing each other there, seeing that the cause (probably subterranean) which discharges them necessarily acts without interruption. This neutralization is of course facilitated on plains above the sea by the moisture, always more or less considerable, with which the layers of air, in contact with the soil, are charged. This, however, is not the case on mountains, and especially on the higher peaks. The dryness of the air must render the combination of the two electricities more difficult, and enable the negative on the ground and the positive in the air to acquire a tolerably energetic degree of tension. This is shown on the one hand by the strong positive electricity which air has at these great heights, and on the other hand by the attraction which the mountains exert on the positive clouds of the atmosphere in virtue of their negative electricity.

Now, what would take place if a metal plate, sunk in the ground on the plain, were connected by means of a telegraphic wire with a similar plate immersed in the soil of a high place? If the negative electricity with which the two places are unequally charged, were in an entirely statical condition, the metallic wire becoming an integral part of the conducting layer of air which separates them, no dynamic phenomena would be observed. But there is a continuous flow of the negative electricity of the soil towards the positive of the air which produces the neutral layer. It follows necessarily that there is a downward transport of negative electricity, or, what amounts to the same thing, an ascending current of positive electricity in the conducting wire which joins two places at different heights above the sea level.

This furnishes the explanation of a phenomenon frequently observed, and under conditions quite free from objection, by M. Matteucci. He observed that in every mixed circuit, consisting of a layer of earth and a metal wire, the ends of which are sunk in the ground, minute precautions being taken to avoid any thermal or chemical action, the wire is traversed by an electrical current whose direction is constant whenever the soils in which the ends are plunged are of unequal heights. The current ascends on the metal wire; its intensity increases with the length of

the wire and with the difference in level of the ends. M. Matteucci has convinced himself that at the higher station there were very intense indications of positive electricity, while these signs were feeble, or were entirely wanting at the lower station.

All this, then, agrees with the theory which I have laid down, but to confirm the exactitude of the considerations on which it is based, I have tried to reproduce the phenomenon observed by T. Matteucci by means of a laboratory experiment. With this view I placed on an insulating support a sphere of about 30 centimetres diameter, made of porous earthenware, or of wood covered with bibulous paper, so as to have, by wetting the surface, a moist conductor representing the earth. I fixed to the highest part of the sphere in contact with its moist surface a small metal disk. A second one was arranged in the same manner at a distance of from 50 to 90 degrees from the first. I then joined the two disks by the wire of a galvanometer. No current showed itself, either positively or negatively even when the insulated sphere was positively or negatively electrified. By means of an insulating rod I then suspended, at a distance of 2 to 3 centimetres above the sphere, a plate slightly concave on the lower side, and of such dimensions that it only covered a small portion of the sphere—that, namely, in the midst of which was the upper metal disc, and therefore not the portion in which the other disc was placed. The apparatus being thus arranged, I charged the sphere representing the earth with negative electricity from a machine, the positive electricity of which was led to the concave metallic surface representing the atmosphere. The galvanometer quickly indicated the existence of a current, the direction of which was from the lower to the upper disc. This current was perfectly regular, and lasted as long as the machine was at work.

M. Matteucci has also observed that during storms the oscillations of the needle of the galvanometer are sudden and frequent, while on calm and clear days the deflection of the needle remains almost constant. The slight current from south to north observed in wires placed horizontally in the direction of the meridian are probably due to the fact that the negative tension of the earth gradually increases from the equator to the poles. Positive electricity in great quantity is accumulated in the atmosphere near the poles by the trade winds. The discharges of contrary electricities in polar regions give rise to polar auroras and the powerful electrical currents which accompany them, and which circulate in the ground. These currents show themselves by their action on compass needles and through telegraph wires.

There are a great number of partial and local facts arising from unequal tension in the variably distributed electricity with which the globe and atmosphere are charged. The attraction of the clouds by mountains, and the phenomena of phosphorescence which they sometimes present, arise from the same cause, and many other natural phenomena—water-spouts for example—have the same origin.

THERE is a growing interest in electric developments in all the scientific circles of Europe.

## Paris Exposition of 1867.

### Automatic Telegraphs.

Siemens and Halske, Berlin, exhibit an automatic Morse telegraph, in which the signals are given by a contact lever, moved by an arm under which metallic types are drawn. This telegraph is a modification of the magneto-electric automatic telegraph shown by the same manufacturers in 1862. The use of magneto-electric currents was found to be attended with certain disadvantages which the galvanic current is free from. The types are arranged in a sort of composing-rule. They are of three kinds—dots, dashes, and spaces. Arrangements are also shown for composing and decomposing the dispatches. The composing apparatus is supplied with a keyboard. When a key is pressed down a corresponding type falls into a guide, from which it is struck into the rule, each time a letter is completely set. The distributing apparatus is supplied with three holes of different form, agreeing with the forms of the three sorts of types. A rod is forced along the rule, which pushes the types, step by step, before the three holes, behind which corresponding hammers strike them laterally. The first hole is small, and allows all the narrow or dot types to enter; the second hole is twice as broad, but has a projection at the bottom, over which only the space-types can pass; the third hole is complete, and suits the dash-types. A polarized direct working Morse apparatus is used for receiving the reversed currents sent by this apparatus. The positive currents lift the writing-beam and produce dots and dashes; the negative depress the beam and produce spaces.

Digney Brothers, Paris, exhibit also an automatic transmitting apparatus, intended, like the last, to dispense with the employment of the key. The message is punched out of a strip of paper, which is then passed, with a uniform velocity, between a rotating cylinder and two levers, attached to which are two light metal springs, whose oscillations between fixed screw-points effect the necessary contacts and determine the signals transmitted into the line. The holes are punched out in two rows—one for dots and the other for dashes. The punching is done by means of a key with three levers. The first lever punches out long rectangular holes for the dashes, the second lever only pushes the paper forward, and the third punches out square holes for dots. The paper is drawn forward whenever either of the levers is raised up, after being pressed down; this is done by two brass rollers, with roughened surfaces, on the axis of one of which is a ratchet caught by clicks attached to the levers at different distances from their centres of motion. When the middle lever is pressed down its click snaps over one tooth and draws the wheel round so far, when it rises again. When the dot lever is depressed its click snaps over two teeth, and, going back, draws the paper forward twice as far. The dash-lever draws it, in the same way, three times as far.

The transmission of the message is effected by means of a clock-work, not differing greatly from that of the usual Morse receivers. The prepared paper strip is drawn between two brass rollers. Be-

fore reaching them, however, it passes between a barrel, or anvil, and two light levers which set the contact-springs in motion; the latter being in the circuit of line and battery. As the paper passes through, one or the other of these levers falls through the holes and makes contact, the length of the contact being determined by the length of the hole.

By this system a speed of thirty-five words or 175 letters per minute is attainable—about double the speed with which an average telegraphist can work.

### Correspondence.

On every hand we hear words of approval of the recent movement among the operators to establish a Life Insurance on a basis so simple and inexpensive as to be within the reach of all. All this is well enough, but its success depends entirely on the efforts of those who enroll themselves among its members to complete the requisite number so as to give it value. The scheme itself is simple and excellent. We do not grudge the labor it costs us, neither does its excellent secretary. But the officers of the Association cannot move about drumming up subscribers, although they do their share even in this service. Every one who joins is as much interested in its success as any other. There are no fat places, no perquisites, no favorites, nothing but a simple proposal to help each other at death. Nor has this scheme any antagonistic elements. It stands on its own merits. If it fails, there is nothing lost; if it succeeds, an easy provision has been made to bridge over the hour of darkness and sorrow. Its officers would be glad to receive a prompt response from all who design to connect themselves with it. See Advertisement.—ED.

TRENTON, N. J., November 18, 1867.

D. R. Downer, Esq.:

DEAR SIR—Your circular to the operators informing us of the formation of a Mutual Life Insurance Association, composed of telegraphers, came duly to hand, and from the tenure of its contents I take the liberty to offer a few suggestions. I assure you that I heartily endorse your views mainly, but would advise you to curtail your field of operation to about two or three States for one organization, namely: New York, New Jersey, and Pennsylvania, or any States you may suggest that might suit better your association. My object in making this suggestion is to bring the limit of the number of members to a smaller compass. I think that you should limit your number of membership to from five to seven hundred, and look very particularly to what portion of our country you will admit in commencing your organization. The most healthy portion is the great object first in view. I feel sure you will be able to obtain a sufficient number of members in the States mentioned. In this State the statistics show that deaths average three per annum for every five hundred souls. This would show the rate of insurance to be very low, which is the object to be obtained. Again, if you admit members from all parts of the country, you will increase your risks three-fold, while you can command an organization quite sufficient near home.

My experience teaches me that such an organization should not exceed five hundred members, to become purely what its object is really intended for; and I think when you meet again and duly consider this matter, you will coincide with my views. I don't hesitate to say it is one of the best organizations in the world, and when properly limited is the cheapest insurance in existence. I propose to join your association, and shall send you my name with others in a few days.

When you are fully organized, you can advise Boston, Washington, and Chicago, &c., &c., to form similar organizations.

Yours, very truly,  
JOHN A. WRIGHT.

RICHMOND, Va., November 18, 1867.

D. R. Downer, Esq., Secretary Telegraphers' Mutual Life Insurance Association:

DEAR SIR—I have received by mail your circular, or prospectus of the "Telegraphers' Mutual Life Insurance Association," and heartily endorse the scheme, if honestly and judiciously managed, it far exceeds any plan I have yet seen presented for the good of the fraternity.

The ultimate benefit to be derived from this wise foresight, is such as to commend it to the favorable consideration and prompt action of the considerate portion of telegraphers, particularly those who have families dependent upon them.

Enclosed find \$1.50. I desire to become a member of the association, and will thank you to send me a certificate of membership as indicated in the fifteenth article of the prospectus.

Very truly yours, J. R. DOWELL,  
Sup. 1st Dis. W. U. Tel. Co.

### Dial Telegraph.

Guillot and Gatget, Paris.

This is a magneto-electric dial-telegraph, the transmitter of which consists of four bobbins with soft iron cores fixed in the corners of a square upon the two poles of a permanent steel magnet, as in one of Professor Wheatstone's telegraphs. A soft-iron keeper, upon an axis which passes in the middle between the four bobbins, rotates over their poles and alternately closes the magnetic circuits of the opposite ones. The axis of the keeper carries a pinion which engages with a tooth-wheel on the arbour of the transmitting handle. The latter turns over an ordinary French dial-plate. The wire of the bobbins forms a single circuit, one end of which is to earth and the other connected with a metal spring which, when the handle is raised to turn it round, makes contact with a ring on the central arbour in permanent connection with the line. When the handle sinks into one of the notches of the dial-plate, this ring is depressed, breaking the circuit of the bobbins and making contact with the receiver. The soft-iron keeper is nearly broad enough to close the circuit of two poles, at the same instant that it leaves the circuit of the two neighboring ones. The purpose of this is, that the currents induced by the armature leaving and approaching may be combined to form a single current. On lines with little resistance this transmitter may work well, but, whilst neither the bobbins nor the magnets are moved, it cannot be expected to give intense currents.

The receiver used with this instrument is almost identical with that of Bregnet's step-by-step railway telegraph; only, to accommodate the reversed currents, the keeper is formed by a permanent magnet which plays between the poles of two electros, one on each side of it.

The Imperial Telegraph Commission, Vienna, amongst other apparatus for military purposes, shows an electro-magnetic dial instrument, constructed by Mr. Marcus, of Vienna. The transmitter is formed by a Stohrer's induction apparatus, in which two bobbins, upon the ends of a soft-iron armature, are rotated over the poles of a permanent magnet. The receiver consists of an electro-magnet between the poles of which a small permanent magnet oscillates and turns, by means of two pallets fixed upon it, a ratchet-wheel on the axis of the pointer.

The dial-plate of the transmitter is not supplied with holes, or notches, in which the handle can be arrested. In consequence of this want, it is almost impossible, when transmitting, with a uniform velocity, as is necessary in using magneto-electric apparatus, to arrest the handle exactly at any letter. This is evidently not an oversight, but is done purposely, on account of the weight and form of the rotating bobbins, which, when in motion, acquire a consider-

able force. Were they to be suddenly arrested by the handle catching against a notch, this force would be converted to the destruction of some part of the apparatus. With this slight drawback, this magneto-electric telegraph has considerable merits, its power being superior to many of the others exhibited.

### The Postal Telegraph System.

A movement is being started in England to make the Electric Telegraph an adjunct to the postal system, by consolidating the various lines and putting them under the immediate control of the Government. By adopting this plan, it is supposed the expense of telegraphing can be materially reduced, and the use of the telegraph, as a means of communication, be rendered more generally available.

This scheme may do very well for a country where nearly all the more important operations of society are regulated by governmental machinery, and but little is left to be undertaken by private enterprise. But in this land of freedom and business competition, we shall probably do better, and achieve greater progress, by keeping the field of useful undertakings open to all new comers, and confining the functions of Government rigidly within their narrowest possible limits. It is the curse of Europe that she is governed too much; and it is policy for us to keep on the safe side, and avoid those centralizing tendencies, which are continually cropping out in schemes for the Government to do something for the people, which they are abundantly able to do for themselves.

But this is no way to develop the utilitarian genius of any people, who are thus left without motive to action. Governments may be paternal and beneficent, without entering into all the details of business or social intercourse. Men will never try to improve upon old methods nor originate new ones, if placed under legal guardianship and all their wants provided for. They had better run the risk of being governed too little, and be thrown entirely upon their own resources for postal facilities, than to be relieved of the responsibility of thinking and acting for themselves.

Hence, we trust there will be no attempt here to imitate this English plan for undertaking the Telegraph business of that country. If it is a legitimate business for the Government, it is equally legitimate for it to take charge of our railroads and run express, passenger and freight trains, to run factories and cotton plantations, or to build a mercantile marine and run steamship lines across the ocean for the accommodation of foreign commerce.

The true province of Government is to encourage, but not to supersede, private enterprise, in any and all departments of the domain of material industry. We believe that the monopoly of postal facilities is rather a stretch of its prerogatives and anticipate the time when these, as they now exist, will be surrendered to the hands of private carriers on the score of economy.—*Boston Commercial Bulletin*.

The Pope Safe—Civita Vecchia Being Fortified—The Pope to Have a Telegraph Cable to France.

FLORENCE, December 2, 1867.

The fortifications of Civita Vecchia are being strengthened and altered so that a garrison of Papal troops can hold the city as an open gate for the return of the French troops, should the safety of the Pope hereafter require it.

In addition to these precautions Civita Vecchia is to be placed in direct telegraphic communication with Toulon, and for this purpose a submarine cable has been ordered, which will be laid as soon as it reaches Toulon.

What would we, and the Pope, and the Emperor, and all our other friends do without the Telegraph!

### The New York City Telegraph Company.

This company, who have been engaged during the past summer in constructing their lines throughout the city, opened them for business on the 25th of November. They have two wires, which are run on poles, covering almost every part of this city. The lines appear to be very well built throughout. The main office is with the Franklin Company, at 11 Broad street. City offices have already been opened at the following places: Courtland and West streets, Corn Exchange, 93 Wall street, Fulton Market, 40 Park Row, Grand street, between Norfolk and Suffolk, Avenue C and Sixth street, Broadway and Spring street, Grand and Mercer, Jefferson Market, Bible House, Spingler House; Third avenue and Twenty-fourth street, Eighth avenue and Twenty-ninth street, Sixth avenue and Thirty-fourth street, Broadway and Forty-first street. Several other offices will be opened in a short time.

The officers of the company are as follows: Wm. H. Mailler, President; W. T. Coffee, Secretary; M. V. B. Finck, General Superintendent, and F. G. Beach, Superintendent. M. B. Lillis has charge of the main office. The instruments used are main line sounders and registers, manufactured by S. F. Day & Co., of Ballston, Spa, N. Y., and are of excellent workmanship. The tariff on city messages is twenty cents. The line also takes business for all points on the Franklin, Atlantic and Pacific, and other opposition lines.—*Telegrapher.*

### Ohio Railroads and Telegraphs.

The report of the Commissioner of Railroads and Telegraphs in Ohio has been submitted to Governor Cox, but cannot be printed until ordered by the Legislature, owing to an omission in the law. The Cincinnati *Commercial* gives some of the principal statistics of the report:—Total miles of railroad in the State, 3,780; total amount of capital stock of railroads, \$2,529,515 80; total amount of debt of railroads, \$72,120,382 89; total number of railroad employees in the state, 18,331. The Commissioner reports 1,211 animals killed by railroads during the year, and 106 persons killed, and 141 injured from the same cause.

### Telegraphs in Turkey.

Correspondence of the N. Y. Tribune.

While they are wasting their blood and treasure in Crete they are doing one work of peace in Constantinople which will be of interest to Americans. Agathon Effendi, the Director General of Telegraphs in Turkey, went to the Exposition in Paris, and was so much impressed with the exceptional honors paid by the Emperor to our fellow-citizen, Mr. Hughes, that he at once invited him to come to Constantinople and introduce his system there. A new direct line was opened to Vienna, to be worked on the Hughes plan. The Servian Government at first objected to a direct line through Servia, but at last gave in, and the line has been opened. Mr. Hughes has been some weeks in this city, and has won golden opinions not only for his telegraph but for himself. His machine, as now perfected, is certainly one of the wonders of the age. The operators here declare that they can do as much work with it in two hours as with the old Morse instrument in eight hours. Mr. Hughes is still a young man, and it is to be hoped, that unlike most inventors, he may live to enjoy the fruits of his invention. The great practical inventions of this country seem to come from America—ether, the telegraph, the sewing machine, india rubber, the cotton gin, &c. Turkey is about the last country in Europe to appreciate and adopt them. But even Turkey is now, at last, beginning to realize the value of American inventions, and it is a fact by the way of which we may be proud, that Turkey has, for twenty-five years, depended on an American for all necessary inventions

in her machine shops. We have here a modest unassuming American named Hidden, who has been employed some thirty years in the Turkish mint. He is a mechanical genius of the highest order, and any where else would have made a fortune and a name, but here he has only saved untold sums for a Government that would have let him starve this year for want of his pay (two years unpaid), had not our Embassy interfered in his behalf, and after months of effort succeeded in squeezing out the money from the Porte.

### A New Electro-Magnetic "Chronograph."

A late number of *The Cosmos* contains an article of considerable interest on the various applications of electro-magnetism by Professor Glæsener, of the University of Liege, in Belgium. Among them there is a "chronograph" for measurement of very minute particles of time, and which deserves some description as regards its application to artillery. Suppose it is required to measure the velocity of a cannon-ball. For this purpose let a series of targets, consisting of hoops intersected by wires, be placed at given distances. The wires of each hoop communicate with a separate electro-magnetic apparatus, by which an iron pencil-holder is kept in an unvarying position by attraction so long as the circuit is not interrupted. Opposite and close to this pencil-holder there is a cylinder turning on its axis at the rate of four revolutions in a second. Its surface, which is covered with paper, is divided into five hundred parts by lines drawn parallel to its axis, so each part represents one two-thousandth of a second. Its motion is effected by clock-work. Now, whenever the electric current is interrupted the pencil-holder ceases to be attracted, and falls on the surface of the cylinder, on which its pencil, therefore, describes a line. Whenever the circuit is completed the pencil-holder is re-attracted and leaves the paper. Let us now suppose a cannon-ball to be fired through all these targets, so placed, of course, as to lie in the path of the curve described by the missile. Each time it passes through one of the hoops it snaps asunder one of the wires; the circuit is consequently interrupted, the pencil-holder falls and marks the precise time of the passage. And so on, from target to target, each of which, as we have said, is connected with a separate apparatus. In this way, both the *spaces* and the *time* employed in going over it being determined, the *velocity*, which is the ratio of time to space, is determined also to a fraction of one two-thousandth part of a second!

### On Going to College.

A College Professor chanced to meet the founder of Cornell University, when the following dialogue is said to have ensued:

*Mr. C.*—We expect to open the University on the 1st of September, 1868, with a Faculty costing us \$40,000 per year. That ought to give us success.

*Prof.*—Yes, Mr. Cornell, if you can get students. Our young men are not as desirous of College advantages as they might be.

*Mr. C.*—The trouble has been in the Colleges. They have not taught what young men have desired to know to prepare them for business. They have seen College men outstripped by men like myself, who had an education not much broader than that to be gained from Webster's Spelling-book.

*Prof.*—Precisely, Mr. Cornell, and they are just as likely to apply this fallacious reasoning to your College as they have been to apply it to Colleges of the present type—very likely to argue that what was good enough for Mr. Cornell is good enough for them. Young men will go to Colleges only as they are trained to appreciate the advantages which they furnish.—*Examiner and Chronicle.*

### Miscellany.

A new mode of testing armor-plates for ships has been introduced and tried at Chatham dockyard, in which the detection of interior and unseen flaws is made by means of a magneto-electric current. The results are described as satisfactory and conclusive, whether in plates or bars, the smallest defects even having been discovered.

Telegrams which were received in this city from London, on Thanksgiving night, beat time and had 32 minutes to spare. A dispatch dated "London, Nov. 29" was received here at 28 minutes past 11 P.M. on the 28th. To-morrow the Cable Company will reduce their tariff. New lines are in operation on the Newfoundland coast, and it is expected that hereafter the cable will frequently beat time.

Mr. J. W. Stancliffe, for many years the efficient and accommodating superintendent of the Western Union Telegraph Company's lines in this vicinity, has resigned that position, and Mr. Gershom B. Hubbell has been appointed in his place. Mr. Stancliffe has been a faithful agent of the company for fifteen years, and retires with the universal good will and esteem of all whose business has made them acquainted with him.—*Hartford Press.*

### Electrical Countries.

In a paper addressed to the Academy of Science, M. J. Fournet treats of a new and curious subject, viz., the electric state of certain regions. From the report of this paper, in "Galignani," it appears that in the mountains of the basin of the Rhone and their offshoots, there are some spots distinguished for their evolution of electricity, which is sometimes very remarkable; while others, though apparently identical in surface, are in a state of absolute electrical neutrality. Some very striking instances of this are quoted by M. Fournet. On the night of August 11, 1854, when Mr. Blackwell was on the Grand-Mulets, at an altitude of 3455 meters, the guide, F. Couttet, on leaving the hut, perceived the surrounding ridges apparently on fire. He immediately called to his companion to witness the scene, which was owing to a tempest. Their clothes were literally covered with electric sparks, and their fingers, when held up, were phosphorescent. At that very time Lyons was visited with a deluge of rain, and the whole day had been exceedingly stormy. In 1841, as the same guide was accompanying M. Chenal up Mount Blanc, they were overtaken by a violent storm, and found themselves enveloped, as it were, in thunder and lightning. All the stones and rocks around them emitted electric flames, and yet the summit of Mont Blanc, and the sky around it, was perfectly clear. In 1867, Saussure, Jalabert, and Pictet, were on the Breven at an altitude of 2520 meters. They soon experienced a strong pricking sensation at their fingers' ends on stretching them out. This sensation became stronger and stronger, and at length electric sparks could be drawn from Jalabert's hat band, which was of gold lace, and even from the knob of his cane. As the storm was raging above their heads they had to descend some twenty-five or thirty meters where the influence of this electricity was no longer felt. Another instance of this occurred on July 10, 1863, when Mr. Weston and several other tourists ascended the Jungfrau, and there the snow itself, which fell during the storm which overtook them, proved to be electric.

Granite found in Minnesota has been tested by the Government geologists, and pronounced to be equal, if not superior, to any in the United States, and fully equal to the Russian granite, known as the finest building material in Europe.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID,  
145 Broadway, New York.

NEW YORK, DECEMBER 2, 1867.

### Journal of the Telegraph.

With this issue the *Telegraphic Journal*, slightly changed in name, begins a new existence. Mr. Borst has ceased to be its editor. He has done bravely, and retires after sustaining his paper well and vigorously. It now comes into other hands, to be fed by a new nurse, and guided by a new protector. Time, which tries all things, will prove whether the change mars its prospects, or weakens its power.

The new editor has little to say for himself. He claims no special ability for the duty, and is without experience of editorial life. Yet he has seen something of the Telegraph, has followed its fortunes through many years, has had some share in its management and growth, has gloried in its capacity for usefulness, and desires the realization of all the good which, well directed, it can accomplish.

He recognizes the need of some one to conduct a journal which shall record faithfully and correctly the progress of a system which now touches civilization everywhere; to suggest or be the avenue for suggesting possible improvement; to disabuse the public mind of fancied wrongs; to stimulate all who perform its various labors to appreciation of their trust. These vast interests deserve that some one shall preserve their history, and give them a record for those who have nursed them to greatness. A continent pulsating with 200,000 miles of electric nerve may surely claim some modest mouth to speak for it, some one who shall watch its growth, and intelligently estimate its necessities.

Such a record this journal is designed to be. We accept the editorship hopefully. A quarter of a century spent in active supervision of the detail of telegraphic service has given some necessary qualifications for the task. It is undertaken as a duty and a delight. Around no man's heart and mind has the telegraph with all its grand capabilities more lovingly entwined itself. He believes it to be the harbinger of a common language and a united world. The earth will by it become a grand harp, on whose strings the fingers of human brotherhood and commerce will play until the race becomes a unit.

With his easy chair in the Executive rooms of the Western Union Telegraph Company, it will not be expected that he will say anything very disrespectful of its management. He will be entrusted with facts to communicate to those who are interested in its success, and the JOURNAL will be the medium of executive orders and information to all its offices. This secures at once a large circulation in every State of the Union. Every stockholder, and most of the employees will require it, rendering a circulation of

six to ten thousand more than probable. Nor need its circulation be limited to those interested in the Western Union Telegraph Company. Nothing will be published which any one interested in any Company may not read without offense. The JOURNAL will be kept free from all matter offensive to good taste and truth.

To every invention or means of telegraphic improvement, the JOURNAL will gladly lend its aid, and brief communications descriptive of any of these will be published. But offensive personalities, and communications of a general character will be declined.

So the Easy Chair has spoken. Twice each month we will meet you with whatever budget the weeks may provide. We hope the JOURNAL may be welcome and useful, and our interviews mutually pleasant.

JAMES D. REID.

### Changing the Alphabet.

We have received a letter from Mr. Varley, whose name is so familiar in connection with the Atlantic cable and English telegraph lines, with the request that a copy be given to the *Telegrapher*, which has been done. We desire to draw to Mr. Varley's communication the attention of all superintendents and thoughtful men engaged in the work of transmission. The arrangement of figures strikes us as excellent. It will be noticed that every figure is composed of five parts. If there is one dot, there must be four dashes; two dots—three dashes, and so on. The general changes strike us as meritorious. Let them be carefully examined and fully canvassed. It is claimed that a lengthened use of this changed alphabet has proved its excellence. A few letters in our alphabet demand change. It seems time that these changes be made.

While thus referring to Mr. Varley's letter, we take occasion to say that Mr. V. with his genial face, is still with us, seemingly very happy, and no doubt, like his illustrious countryman, Dickens, preparing "notes for general circulation." At the request of the officers of the Western Union Telegraph Company, he is now engaged in an examination of the quality of their lines, and the insulation employed upon them so as to get the opinion of one who has had nothing to do with their provision, and who will report from actual tests. A little sensitiveness might have been expected on the part of experienced superintendents in thus placing the merits of American ingenuity in the hands of a comparative stranger and foreigner, but none has been shown. The cable has made us one family, and all are glad to see Mr. Varley at work, for which he has so much admitted capacity.

### Western Union Telegraph Stock.

The money article of *The Tribune* of November 25th, says:

"Western Union rose to 34½, closing at 34½. It is understood that the floating debt has been paid, and that no dividend will be paid in January. Its receipts show a large increase, and are equal to regular dividends and payments to the sinking fund hereafter."

This statement is, of course, unofficial and the mere guess, so far as the January dividend is concerned, of *The Tribune's* money reporter. That question has yet to be discussed by the Board of Directors. In our next issue we may be able to give the result of their deliberations, and if no dividend is declared, the reason therefor. The statement respecting the general prosperity of the Company is correct. Everything indicates a steady and successful future.

The attention of office managers is directed to important modifications of the cable tariff to be found in the Executive Order on the next page.

### To Correspondents.

Although the size of THE JOURNAL will not permit the publication of very copious correspondence yet we desire, as much publishable matter as possible. All incidents of a telegraphic character, in perplexities, its humors, its personal recollections suggestions of things which might or ought to be, its sad and sunny side, its men—dead, living, resigned or transferred—its poetry and prose, we shall be glad to receive. Especially will communications giving information of the progress of lines built by any Company or individual, or of regions which need the wires to connect its people with civilization, be welcome. We may have to *boil down* much that we receive, and lay aside others because of duplicated information or inappropriate matter. But we will treat all civilly, and even when basking, will do it tenderly.

To some experienced and educated men connected with the active duties of the management and supervision of lines, we look for aid in the discussion of the graver necessities of the business, and the appliances needed to increase the capacity of the lines and perfect the system. To all such we extend a cordial invitation to a share in our easy chair.

### Government Telegraphs.

The Cable announced a week ago that the British Cabinet had resolved to take the telegraph lines of the Kingdom under its protection. No details, up to the date we write, have been received of the basis on which this arrangement was to be made, or what sudden reason had inspired the British Ministry to the decision. There are signs of commotion in English society which may make the management of Telegraph lines by Government desirable. Feudalism is by no means quelled. As it is put down by bayonets in Ireland, it grows throughout England. When the workingmen of England have so far lost the fear of Government as to hold indignation meetings in the rooms of its ministers in Downing Street, there seems the beginning of a popular assertion which may precipitate itself in acts of violence such as have characterized the wild protests of other days. These may not be the causes of this Government movement. It may be to popularize the telegraph and cheapen it. It may be at the appeal of weak lines which cannot pay expenses and so have besought the paternal care of the Government. Be it what it may, we desire no such care in America. Government has work and patronage enough. It may encourage great enterprises, as it has. It may legislate against corruptive elements, and preserve the public from private oppressions, but enterprise is for the people. Hands off.

Mr. Quincy is very eloquent in the Social Science Convention for an absorption of all railroads and telegraphs in Government hands. We are not ready for any such wiping out of that which keeps alive the national life, fires its enterprise and quickens its intellect. The future may demand all these. Let the future speak for itself.

### International Ocean Telegraph Company.

The following named gentlemen were yesterday elected directors of the International Ocean Telegraph Company: W. F. Smith, J. A. Scrymser, A. Hamilton, W. P. Blodgett, C. Knapp, M. L. Delafield, D. H. Haight, O. K. King, T. B. Myers, H. K. Bull, and E. S. Sandford.

The Board of Directors meet for organization December 10.

The Board of Directors of the Western Union Telegraph Company hold their semi-annual meeting December 11, at their rooms, 145 Broadway, N. Y.

## Western Union Telegraph Company.

EXECUTIVE OFFICE.  
NEW YORK, November 29, 1867.  
EXECUTIVE ORDER NO. 45.

ANSON STAGER,  
THOS. T. ECKERT,  
JOHN VAN HORNE, } *General Superintendents.*

Please promulgate the following general order by telegraph upon your Division.

On and after December 1st, proximo, you will observe the following:

1st. RATES OF TARIFF IN GOLD ON ATLANTIC CABLE BUSINESS.  
On messages for Great Britain or Ireland you will charge for 10 words or less, \$25 00  
For each added word, 2 50  
And in addition thereto your present tariff to New York.

For example: The tariff from New Orleans to London on a message of ten words will be \$25, plus tariff from New Orleans to New York, \$8.25. Total, \$33.25, gold.

On a message of twelve words from Washington to London, \$30; plus tariff from Washington to New York, 87 cents. Total, \$30.87, gold.

You will send address, date, and signature free if they do not exceed five words or twenty-five letters. Any excess over five written words, or over twenty-five letters must be charged for. With this exception the rules for counting will be the same as heretofore.

You will henceforth state in check.

1st. The number of written words in entire message, including address, date, and signature.

2d. The number of written letters in entire message, including address, date, and signature.

3d. The number of words charged upon.

4th. The amount charged.

The body words need not be stated as heretofore.

No extra charge for code messages.

In cypher messages, by which are meant messages in numerals or letters not forming any known or dictionary words or names, you will count each numeral or letter as a single word.

When cypher is intermixed with plain words, the plain portion of the message will be charged at ordinary rates, and the remainder as cypher.

2d. ADDITIONAL RATES TO PLACES BEYOND GREAT BRITAIN AND IRELAND.

Messages to places beyond Great Britain and Ireland must be charged the following rates in addition to the rates above stated.

For 20 words or less, including address, date and signature:

Havre, Rotterdam, Amsterdam, Antwerp, Brussels,	\$ 1 00
Paris, Cherbourg and the Channel Islands,	1 25
Berlin, Vienna, Frankfort, Hamburg, Brest, Bremen,	1 50
Marsailles, Stockholm, Gottenburg, Copenhagen,	2 25
St. Petersburg, Florence, Constantinople, Odessa, Christiana,	2 50
Algiers, Madrid,	3 50
Lisbon, Oporto, Gibraltar, Corfu,	4 25
Tripoli,	7 50
Alexandria,	12 50
Cairo,	18 50
Suez,	15 68

TO OTHER PLACES IN FOLLOWING COUNTRIES.

Holland, Belgium, Switzerland,	\$ 1 50
France, Prussia, Austria, German States, Denmark,	1 75
Russia, Italy, Turkey, Sweden, Norway, Greece,	3 00
Algeria, Spain,	3 75
Portugal,	5 00
Turkey in Asia,	6 13
India, China,	26 25

For each 10, or fraction of 10 words, above 20, charge one-half of the foregoing rates from Great Britain.

Determine the number of words by the printed rules for counting heretofore furnished.

Rules for checking and for cypher same as above stated for messages to Great Britain.

WILLIAM ORTON, *President.*  
DECEMBER 4.

We are instructed by the Anglo-American Telegraph Company that from and after midnight, December 4, the address, date and signature of Atlantic cable messages will be sent free irrespective of the number of letters. Any excess above five (5) written words will be charged for. If less than five (5) words, no allowance will be made for the deficit. The Anglo-American Company reserve the right of requiring letters in future messages to be counted in cases where the privilege appears to be abused.

WILLIAM ORTON, *President.*

## Telegraph Stamps.

From the Journal of the Society of Arts, it appears to be a matter of expectation in Paris that the Government, in whose hands is the regulation of the French system of Telegraphs designs to issue stamps for use in the payment of despatches, so as to promote public convenience in the use of the Telegraph. There can be no doubt of the correctness of this expectation, inasmuch as the stamps are already prepared, and specimens of them can be seen at the Champ de Mars. A message with one of these stamps affixed can be thrown into a box at a Telegraph Station provided for that purpose, or can be dropped into the Post Office in an envelope marked Telegraph Despatch—which is immediately sent to the Telegraph Station and placed upon the files.

The French Government have in contemplation other improvements in the Telegraph service the nature of which has not yet been made public. With ample jurisdiction, with abundant means, with no dividends to provide for, with no stockholders to interfere, every opportunity exists to carry out any plan of general convenience which may appear to be demanded by the people or the public policy. And with a territory so comparatively limited, of which Paris forms a natural centre, around which radiate the different lines like the diverging threads of a spider's web, every point of consequence connecting directly with the Central Imperial Office, jurisdiction is easy, the entire system simple, and transmission capable of the utmost promptitude.

The French Telegraph have, like our own, greatly advanced in public use. In 1852 the number of messages recorded is 48,103. In 1866—the record shows 2,842,554.

Stamps have been in use in England for some years.

## Mr. Varley's Letter.

FIFTH AVENUE HOTEL,  
NEW YORK, November, 11, 1867.

Editor Journal of the Telegraph:

SIR—It is not generally known in this country that one and the same telegraphic alphabet is used in Great Britain, France, Belgium, Holland, the German States, Italy, Spain, Portugal, Malta, Switzerland, Denmark, Norway, Sweden, Russia, Persia, Greece, Turkey, Africa, and India: also for the Mediterranean, Persian Gulf, and the Atlantic cables.

This alphabet was originated by the Germans, who have studied the subject with care, and so calculated their alphabet that these letters which occur most frequently in their language have the shortest signals, and the figures—the accuracy of whose transmission is of the utmost consequence—are so formed that the first half of the figure acts as a check upon the correctness of the other half and *vice versa*.

There are but two elements in the alphabet—the dot - and the dash —.

There are 32 letters in the alphabet, 30 of which are composed of not more than four elements, the remaining two of five.

The figures contain each five elements systematically arranged, the first half checking the second and so rendering them as free from ambiguity as they are easy of recollection by the mind.

In Europe the English and other operators have frequently to transmit messages in the German Dutch (Hollands), French, Danish, Italian, Spanish, Portuguese, Russian, Greek, and Hungarian tongues besides the English. As a rule they are unacquainted with these languages, yet they transmit the messages with, comparatively speaking, very few inaccuracies. This is mainly due to the simplicity and clearness of the International system.

When in 1854, 1855, England was connected by cable with Holland, Germany, &c., the "break" of alphabet was a serious inconvenience.

We found the German system of characters far superior to ours. It was already in general use on the continent of Europe and we adopted it.

The change was not attended with any serious difficulty. Every operator was supplied with an explanatory copy of the alphabet and signals. Two months were allowed for its study and a day named for the change. The two months passed away, the day arrived, but many were not ready for the change.

Another month was granted with a similar result. In fact there was on the part of many a decided opposition to the "foreign alphabet."

Gentle pressure was applied to the pocket in the form of a promised reduction of the salaries of those who, at the expiration of the third named period, should be found unable to make

the change, and when that day arrived every one was found prepared. The new alphabet came into operation simultaneously all over our system without any inconvenience.

This system has been brought by cable across the Atlantic Ocean to North America (Newfoundland). It will ere long reach the United States via Behring Straits, for beyond all manner of doubt Russia will sooner or later be joined to America by that route, and then the break of alphabet will be a serious inconvenience.

In this country it is an almost universal practice to send figures twice over to avoid error, first in cypher and then spelled out in full.

This is not done in Europe. At one time all figures (not spelled in full) were repeated back ("collated") to the original station. This has been discontinued for several years as unnecessary, because the figures contain their own check.

When preparing the alphabet for the Atlantic cables, I arranged it so that a motion of the reflected image to the left should correspond to the dot, the motion to the right to the dash. In every other respect it is the International alphabet. The dash has the same length as two dots separated by a space as in the letters i and t.

— - 1  
— t  
The spaces between the elements of a letter have each the length of a dot, thus: — - - - - V

The space between each letter of a word is equal to a dash.  
— c — - - r — - - u — - - s — - - h — - - Crush

The space between the words in a message is equal to two dashes, viz: — - - - - a — - - t — - - r — - - u — - - t — - - h — - - l — - - e

— s — - s — - n — - a — - t — - i — - o — - n — -  
— c — - a — - n — - n — - o — - t — - e — - n — -  
— d — - u — - r — - e — - l — - o — - n — - g — -

a — -	v — -
b — -	w — -
c — -	x — -
d — -	y — -
e — -	z — -
f — -	ch — -
g — -	sh — -
h — -	o — -
i — -	ti — -
j — -	6 — -
k — -	fi — -
l — -	1 — -
m — -	2 — -
n — -	3 — -
o — -	4 — -
p — -	5 — -
q — -	6 — -
r — -	7 — -
s — -	8 — -
t — -	9 — -
u — -	0 — -

Period (.)	— - - - -
Comma (,)	— - - - -
Query (?)	— - - - -
Exclamation (!)	— - - - -
Apostrophe (')	— - - - -
Hyphen (-)	— - - - -
Fresh paragraph	— - - - -
Inverted Commas	— - - - -
Parenthesis	— - - - -
Understand	— - - - -
Wait	— - - - -
Erase	— - - - -
Call Signal	— - - - -
End of Message	— - - - -
Cleared out all right—	— - - - -
("I don't understand")	? — - - - - ?

There are two unauthorized or "operators" signals much used to replace the words "telegraph" and "wire reply" ("draht-antwort" in German messages).

Telegraph  
Wire reply  
draht-antwort } — - - - -

The only use I have ever seen made of the ! is to enable operators to abuse each other by wire. *within the law*, half a dozen !!!!! being equivalent to ironical admiration of the operators stupidity.

I have omitted the colon and the semicolon, as they are never used on the telegraph.

The comma signal is always translated into a dash, thus:

Buy fifty midlands \ sell Erie at sixty \ wire reply —

The \ being equivalent to the , and clearer if less slightly.

The & ÷ ÷ are important in the German language.

The accented é is important in French to distinguish between the past participle and the present tense. The apostrophe is equally necessary in French, thus: C'est, l'intention, de l'Empereur.

The Spanish ñ I have never seen used. The period (.) is generally written in three pairs, the mind counting 3 more easily than 6—thus: — - - - -

The erasure is frequently divided into 3 threes, and for the same reason, thus: — - - - - It is used as follows: Suppose the operator to have misspelled a word, he gives the nine dots (the erasure signal) goes back to the word before the error repeats it and continues.

Obediently Yours,  
CROMWELL FLEETFOOD VARLEY.

## Patents.

71,158.—ELECTRIC SWITCHES.—Samuel Gardiner, Jr., New York, N. Y.

I claim, 1. The shaft A and arm E, constituting an electric switch held to its bearing by a spring C, to insure effective metallic connection, substantially as described.

2. The cam-collar H, employed to withdraw the switch from its bearing in the act of rotation, as explained.

3. The conducting plate L, employed in combination with the rotary switch A E, and cam-collar H, to impart a given number of impulses by a simple rotation of the switch, as set forth.

4. The lighting key M, in combination with the gas-turning device A E C H L, for the purposes set forth.

5. The combination of the indicating dial J, and index K, with the rotary switch A E, as and for the purpose set forth.

71,005.—LIGHTING GAS BY ELECTRICITY.—John M. Higgins, (W. B. Culbertson, administrator,) of St. Louis, Missouri.

I claim, 1. The switch S, vibrated by the rotation of the wheel on the gas-cock, substantially as described.

2. The combination of the wheel D with cams *d d* and the vibrating switch S, as described.

3. The arrangement of the clock-gearing, the fan K, the wheel D, the escapement L I I', and the notched wheel Q, substantially as described.

4. The armature O, spring-catch o, and escapement L I I', arranged substantially as described.

## Among the Newspapers.

Mr. Henry Sedley and Mr. Dorsey Gardner, editors of the *Round Table*, are to publish and edit the new eclectic weekly known as *The Week*.

Dr. William A. Hammond, editor of two medical journals and professor in Bellevue Hospital, is a frequent and able contributor to leading journals. He has been mentioned in connection with the editorship of Lippincott's proposed monthly.

Mr. Charles B. Seymour, of the *Times*, who has just returned from Paris, would do a good thing if he would write a book upon the American display at the Exposition. The accounts have been confused, and often unintelligible.

Mr. George Wakeman, of the *World*, is in the field as a lecturer. He is a capital writer.

Mr. William Winter continues as hard a newspaper worker as ever. He does a great deal of work for the *Weekly Review* for the *Tribune*—and good work it is.

The *Post* has a pretty strong quartette in Mr. Bryant, Mr. Godwin, Mr. Nordhoff and Mr. Maybrick.

The *Round Table* prints a supplement this week.

The *Iron Age*, *Tobacco Leaf* and *Dry Goods Reporter*, are three very profitable papers.

Mr. Mackey, proprietor of the *Dry Goods Reporter*, has fitted up a large room in his building on White-street, for a noonday prayer-meeting.

The *World* Publishing Company will issue a complete political almanac for 1868. It is nearly ready for publication.

## Severe Storm at Cleveland.

CLEVELAND, O., Nov. 30.

A heavy storm of wind has been raging since midnight, and it is snowing and freezing. The bark *Potomac*, loaded with telegraph poles, got adrift and ran on the piles against the Marine Hospital at 9 A.M. The crew were saved. The vessel is pounding heavily against the piles and on the bottom. She will probably break up.

## Chronicle of the Telegraph.

4th Sept., 1837.—U. S.—Prof. Morse showing his model of a telegraph.

5th Sept., 1858.—Valentia, Ireland—C. F. Varley arrives to test Atlantic cable, which is out of order.

6th Sept., 1858.—Valentia, Ireland—Varley finds by test bad leak in Atlantic cable, about 300 miles out.

8th Sept., 1857.—New York—S. C. Bishop patents his insulation for wire.

9th Sept., 1737.—Bologna, France—Prof. Galvani born.

10th Sept., 1838.—Paris, France—In presence of the French Academy of Science, Morse operates his telegraph.

12th Sept., 1862.—H. C. Bull, Frank Drummond, F. H. Lamb, C. W. Morse, W. H. Kerrer, operators, captured by rebels during rebellion. In May paroled at Richmond.

13th Sept., 1492—Christopher Columbus discovers his compass affected by magnetism.

## Case of Conscience.

ALBANY, November 25, 1867.

O. H. PALMER, Esq.,

Secy. and Treas. W. U. Telegraph Co.:

DEAR SIR—I have received a letter, inclosing \$5, from a Telegraph operator, who a few years ago, while in charge of one of the offices of the American Telegraph Company, defrauded the Company of a small sum. He is endeavoring to live a better life, and wishing to make reparation, has requested that this money be forwarded to the rightful owners.

Very truly,

GEO. B. PRESCOTT, Supt.

## A Compendium of English Literature.

In 4 vols., crown 8vo., price \$12, cloth, new style, beautifully printed by BALLANTYNE & Co., with new Steel Illustrations.

HALF-HOURS  
WITH THE BEST AUTHORS.  
A LIBRARY EDITION.

Remodeled throughout by its original editor, CHARLES KNIGHT with selections from authors added, whose works have placed them among the "Best Authors" since the publication of the first edition.

This book contains three hundred extracts of the best efforts of our great standard authors, whether they be poets or historians, essayists or divines, travelers or philosophers, arranged so as to form half an hour's reading for every day of the year. The student finds a taste of every quality, and specimen of every style. Should he grow weary of one author, he can turn to another; and if inclined to be critical, he can weigh the merits of one writer against those of his fellow. It gives us a glimpse of the celebrities assembled within its portals. At a glance the student can obtain some idea of the subject. Such books as these are the true foundation of that knowledge which renders men celebrated and famous.

The above elegant edition is now ready.

SCRIBNER, WELFORD & CO.,  
654 Broadway, New-York.

## GROUP PHOTOGRAPHS.

I have received for sale a few copies of a Group Photograph, size 18x24 inches, of English and American Telegraphic Engineers, Electricians, &c., from London. Among the group are MORSE, BONNELLI, FIELD, BRIGHT, COOKE, WHEATSTONE, CLARK, SAWARD, HENLEY, WHITEHOUSE, and others—29 portraits in all—giving the names, profession, and residence of each person. Price \$5 per copy. Address all orders, with money enclosed, to

J. HOWARD,

Care JOURNAL OF THE TELEGRAPH, 145 Broadway, N. Y.

BANKERS, MERCHANTS, AND OTHERS, SHOULD SEND by the HARNDEN EXPRESS, No. 65 BROADWAY, as they have unsurpassed facilities for the rapid and safe forwarding of gold, silver, jewelry, and merchandise of every description. Also, for the collection of notes, drafts, and bills, bills accompanying goods, quartermasters' checks, &c., for very low rates. Their expressmen are run on lightning passenger trains, in charge of competent messengers.

## American (Waltham) Watches.

THE BEST IN THE WORLD.

Sold Everywhere.

Wheeler & Wilson's Lock-Stitch Sewing-Machine and BUTTON-HOLE MACHINE, No. 625 Broadway.

Weed Sewing Machine.—Improved Wheel, or DROP-FEED. Salesroom No. 613 Broadway.

LITHOGRAPHY IN ALL ITS BRANCHES, SHOW CARDS, book plates, music titles, labels, views of buildings, &c., &c. Publishers of M. M. Diplomas, size 19x24, for framing; price, \$1.00. R. A. Chapter of notes, drafts, and bills, bills accompanying goods, quartermasters' checks, &c., for very low rates. Their expressmen are run on lightning passenger trains, in charge of competent messengers. All orders must be addressed to H. C. ENO, Publisher No. 37 Park Row New-York.

## THE AMERICAN BUREAU

FOR

## LITERARY REFERENCE.

AGENCY FOR AUTHORS, PUBLISHERS, EDITORS, LECTURERS, AND LYCEUMS, AND FOR ALL WHO HAVE ANY LITERARY COMMISSIONS TO BE EXECUTED.

THE BUREAU UNDERTAKES,

- 1.—To gather Facts and Statistics upon all subjects, and to present them in an intelligent form, either for literary or business purposes.
- 2.—To furnish Printers' Estimates for authors, and to supervise the publication of works.
- 3.—To receive manuscripts either for sale to a publisher, or to be read for a critical opinion.
- 4.—To supply Translations of Books and Documents, and to write letters and circulars in various languages; composing the same when desired.
- 5.—To secure Lecturers for Lyceums and engagements for Lecturers.
- 6.—To provide Editors for newspapers, and articles for daily or periodical journals.
- 7.—To provide Correspondents for newspapers, especially for Washington, New-York, Paris, and London.
- 8.—To select or purchase books for private parties or for Libraries, and to search for rare and old editions.

The Bureau requires a fee of One Dollar before any commission is undertaken. The subsequent charges vary in accordance with the actual service rendered.

All Commissions should be addressed to

**Miscellaneous Reading.****Rare Instance of Devoted Friendship.**

The following is from the Louisville (Ky.) *Courier* of the 25th inst.:

The four unfortunate Misses Morgan, who were burned to death by the dreadful accident on the railroad, near Cincinnati, on Thursday morning last, were ladies of education, refinement, goodness and respectability, and, as we have already stated, daughters of the late Mr. Benjamin Morgan, formerly of the firm of Price & Morgan, merchants in Philadelphia, and afterwards President of the Bank of Louisiana, at New Orleans, and interested in large sugar estates. At the time Messrs. Price & Morgan dissolved partnership they each possessed a handsome fortune, and they mutually agreed that in case of pecuniary misfortune or loss befalling either of them, the other, if still in good circumstances, was to share his property with the unfortunate one. Many years afterwards Mr. Chandler Price failed in Philadelphia, and Mr. Benjamin Morgan transferred to him a fine row of buildings on Tchoupitoulas street, New Orleans. Some years after, and about the time of Mr. Morgan's death, the latter became much embarrassed by endorsements for his acquaintances. Mr. Price having in the meantime accumulated another fortune, after the death of his old partner, re-conveyed the same valuable property on Tchoupitoulas street to Mr. Morgan's children. This is one of the rare instances, in this life, of faithful, honorable and undying friendship, and quite as extraordinary as that all four of the daughters should be killed at one fell swoop, a thousand miles from home.

**Making Lightning.**

A novel machine for generating electricity, worked by an eight-horse steam engine, was recently exhibited at a Scientific gathering in London.

"The electric action developed by this power, through the intervention of immense magnets and nearly twenty hundred weight of copper wire, was so tremendous as to burn bars of iron like sticks of wood, producing a light too vivid and intense to be looked upon. Electric beacon lights are likely soon to supersede all others, as the calcium and magnesium lights have already, to some extent, superseded oil. The one lately established at Cape Grisez, on the coast of France, flashes light across the British Channel and for some miles beyond the English shore-line. There are now three electric light-houses in Europe—two in France and one in England—and the supremacy of electricity over every other artificial illuminator seems in a fair way of being demonstrated beyond all cavil."

**Atmosphere of Underground Railways.**

The inquest on the body of a young woman who died suddenly while traveling on the London Underground Railway has resulted in a verdict of death from natural causes. The evidence of the scientific witnesses was conclusive as to the innocuous character of the atmosphere of the railway. Two independent analyses were made, and both agreed in the opinion that there were no impure gases which existed in sufficient quantities to affect the health even of passengers who were in a diseased condition of body.—*Artisan*.

There have been various speculations upon the possibility of the Suspension Bridge giving out some time away in the future. A few years since the idea was broached that the wires would granulate from constant vibration so that the cables would fall to pieces like ropes of sand. Now the stone in the towers is crumbling away from the action of the atmosphere and men are engaged cutting out the stone that is thus decaying, and supplying the place with Medina stone.

**Telegraphers'****Mutual Life Insurance Association.**

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates, and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

J. D. REID, Treasurer.

**DIRECTIONS TO APPLICANTS.**

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

**JOURNAL OF THE TELEGRAPH.**

Published on the first and fifteenth of each month, commencing with December 2, 1867, will be what its name indicates, a record of Telegraphic progress throughout the world.

Although issued from the executive rooms of the Western Union Telegraph Company, and liberally patronized by that Company, the discussion of all subjects of interest to the Telegraphic world will be left free in the Editor's hands, and treated upon their merits as these may commend themselves to him.

By the aid of a liberal supply of periodicals having to do with electrical science, and coming from different parts of the world, a valuable gleanings of matter interesting to all owning or using, or working or managing Telegraph Lines will be provided. In this the Journal will be much aided by correspondence from experts both at home and abroad, who will keep it fully posted on electric subjects.

What it will advocate, or what oppose, it is not necessary to say. Warmly attached to the business as one of the most useful agencies known to the world, its care and purity, and adaptation to the wants of civilization will be the pre-eminent design. All communities should feel that in the Telegraph they have a common interest, and that national greatness, universal peace, world-wide sympathy and social happiness is largely dependent on its use and possession. This feeling will be fostered as vigorously as it is felt.

To those holding stock in Telegraph Companies the JOURNAL should have value. It will not be an advertisement for everything which any Company does or designs, but it will convey from time to time exact and truthful information respecting its business and condition, which must make it acceptable to all in any way connected with its interests. Even to those who do not hold stock, and for mere purposes of information, the JOURNAL, furnished at so trifling a cost, should be an acceptable and essential part of their means of general information.

To managers and operators, and all engaged in the service, we can only say that our interests are the same, and no man feels the ties of brotherhood stronger than the Editor of this new medium of intercourse between us. We shall use our liberty freely and frankly and kindly, and shall be happy only as being the means of good and blessing to others. It is no part of our nature to abuse or destroy. But it may be our duty to speak positively of evils thoughtlessly engendered, with a view to the ultimate good of all. We shall claim liberty to discuss all things freely, yet hope never to say that word which shall needlessly cause offence. Those only who demand a monopoly of opinion will find the opportunity for dissatisfaction.

Correspondence, brief, practical, sketchy, sensible, will be received gladly.

**TERMS OF SUBSCRIPTION:**

One Copy per Year, . . . . . \$1 00

Five Copies, . . . . . 4 00

Single Copies Five Cents.

**IMPROVED TELEGRAPH INSTRUMENTS,**

AT THE FOLLOWING PRICES:

Small Box Relay, \$16. Same in Rosewood, \$17.  
 Medium Box Relay, \$17. Same in Rosewood, \$18.  
 Pocket Relays, with all the adjustments of the above and good Lever Keys, \$22.  
 Excellent Registers, \$40  
 Pony Binders \$6.25.  
 Keys with tumbler circuit closer, \$5.50.  
 Hill's Battery, per cup, \$1.45.

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case I will make no charge for package.

Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the *Helix*, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-600th to the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

VOL. I.

## The Government and the Telegraphs.

[From the London Saturday Review.]

The official paragraph which announces the Government Bill for acquiring possession of the Telegraph system, leaves it a doubt whether the purchase is to be optional or compulsory. But if the Post-office is authorized to establish telegraph communication, the companies will have no practical choice in the matter. As the current of popular opinion has of late set strongly in favor of administrative centralization, there can be little doubt that Parliament will favor the withdrawal of the telegraphs from the control of private enterprise; and if the proposed terms of purchase are equitable, it will scarcely be worth the while of the shareholders to resist. The grant of full compensation is as expedient as it is just, for adventurers who try mechanical and commercial experiments for the public good are likely to be discouraged if the fruits of success are appropriated by the community. If the telegraph had proved a failure, Parliament would not have made good the loss, and it has no right to claim on behalf of the State the actual or proximate profits. The only legitimate gain to the revenue must arise from *unity of management*, and from the saving which may perhaps arise from the employment of Postmasters and the use of existing Post-offices.

It may be admitted that the telegraph companies have not troubled themselves to earn popularity by extending or improving public accommodation. With an obstinacy or obtuseness which will perhaps be inherited by their Post-office successors, they have steadily disregarded the essential consideration of speed in the transmission of messages. The boys who carry telegraphic despatches may be recognized by their loitering gait, and the clerks are apparently selected for their indifference to the urgency of customers. Still graver inconvenience is caused by the *want of reciprocal arrangements among different companies*. There is no telegraph office in the Kingdom which possesses an accurate list of all stations to which a message can be dispatched, although the clerks generally consent to receive the message and the payment, afterwards exercising a discretion as to the performance of the contract. In the hope that the Post-office will do the work better and cheaper, a majority of those who use the electric telegraph will almost certainly support the proposal of the Government. The capital invested in telegraphs is small in proportion to the extent of the undertaking, and the Government being comparatively indifferent to loss could at once ruin any recalcitrant company by a privileged competition.

The promoters of the scheme state with perfect truth that many towns and villages are at present without telegraphic communication, and the implied inference that the Post-office will supply the want represents, it be hoped, the serious intentions of the Department. Yet it will be strange if, in the administration of the telegraph system, the Post-office throws aside its habitual indifference to the efficiency of the public service in the rural districts. In all practicable cases the Government prefers mail carts to railways, and foot postmen to mail carts, nor is

any sight more common in a country village than the passage of a mail train on its way to a distant post town, from which a messenger walks back at his leisure with the post bags in the course of the day.

In one of the official articles on proposed assumption of the telegraphs, the writer incautiously dwelt on the convenience which would be derived from the transmission of telegraph dispatches by the letter carriers on their rounds. Only a Post-office functionary could have failed to perceive that the lazy boys who are to be superseded by the letter carrier are at least sent on special errands soon after the arrival of messages at the telegraph office. The periodical circulation of dispatches, which for the most part represent immediate urgency, would render telegraphs practically useless. A letter received at St. Martin le Grand at 3 P. M., is at present delivered in the Tyburnian district between 7 and 8, and according to the official plan, telegraph messages will hereafter be even more wantonly delayed. It is often worth while to save five hours out of six by sending a telegram, but few persons would care to send a message to London with the knowledge that it would reach its destination four hours after its arrival at the office.

If special messengers are employed, there will in that respect be no diminution of expenses, but the rent of offices will be saved, and in many instances the Postmasters or their assistants may conveniently undertake the duties of operators and clerks. The extension of the system of uniform charges from letters to messages will be perfectly reasonable. As Sir Rowland Hill has taught the present generation the habit, if not the art of writing, so cheapness and facility of telegraphic communication will perhaps lead to substitute messages for letters. As a message employs more labor for its transmission than a letter; the charge may properly be higher, but the companies have probably not yet lowered their tariff to the most profitable level.

It will not be necessary to secure to the Post-office the monopoly of telegraph dispatches, although the Department has the exclusive right of conveying letters. If private owners of a line can undersell the Government, their enterprise will prove that their charges are too high, and it is unlikely that such an enterprise would be attempted except as a corrective of notorious evils. The railways will find it necessary to maintain their telegraphs for the service of their lines, and there will be some difficulty in placing the same instruments in the hands of the Post-office for general use; but details of this kind can be arranged by competent persons when the principle of the transfer has once been admitted. There will be room for financial ingenuity in the necessary arrangement for charging the principal and interest of the purchase money on the profits of the undertaking. The net revenue of the Post-office is a tax levied at an arbitrary rate; nor is there any abstract reason against performing at cost price a service which requires little or no capital. The form of the impost is not likely to be changed. The telegraph wires must, in the first instance, bear the burden of the interest of the purchase money, and of a sinking fund for instalments of the principal. The Government will also expect to receive a per centage on the receipts as in the case of letters.

## PARIS EXPOSITION OF 1867.

### Telegraph Apparatus and Processes.

BY ROBERT SABINE, TELEGRAPH ENGINEER.

The telegraph apparatus shown in the Paris Exposition contains few novelties but indicates satisfactorily the quiet progress which has been made in this art-science in the five years which have elapsed since the last London Exhibition. Were it not for such exhibitions as these, the task of tracing the advancement made in telegraphy within certain periods would be an almost impossible one.

In 1851, Wheatstone's single needle instruments were used, almost exclusively, on the English lines, Morse's electro-magnetic recorders, upon the Swiss, Breguets dial telegraph upon the French railway, and Froment-Chappe's double pointer upon the French state lines. The great telegraph novelty, in 1851, was the copying system, of which specimens were shown by both Bain and Bakewell. The public attention was attracted to them in admiration of their performances whilst experience had not yet shown their impracticability. After the Exhibition, the idea of telegraph engineers became more generalised, and we find the fruits of this in the Paris Exhibition four years afterwards, where the Morse apparatus was shown in a state of transition from the degree of perfection which it has subsequently reached. In 1862 the honors were divided between the Morse and the dial telegraphs. The Morse, adopted almost by all the administrations of Europe, had offered inducements to the manufacturers to devote their energies to the perfection, such as we see it to-day from the workshops of Siemens and Digney. The dial telegraphs had received an impulse from the growing employment of private lines in the metropolis under the energetic influence of Professor Wheatstone.

### PRINTING TELEGRAPHS.

In the Paris Exhibition of 1867 there is a significant inclination on the part of the French inventors to bring forward type-printing telegraphs. This is the result of the great success which has been attained by Mr. David Hughes' telegraph—the only instrument of similar importance which has not figured in previous exhibitions. This system, introduced from America, promises ere long to rival the Morse in the extent of its employment.

Every day we are advancing towards the possession of standards of merit. Telegraphy is growing, from stage to stage, more practical, because those inventions which do not come up to the established standard find their level sooner than they did before these standards existed. Thus the single needle telegraphs, which, during long years, held their own in England, have almost entirely died out. The infinite host of fantastical schemes of submarine cables and methods which we heard of in 1862 have been frightened with such a standard as the Hughes type-printer, the numerous inferior schemes which emulation has called or recalled into being in this Exhibition will, infallibly, in a short time retire into oblivion.

The writer proposes to classify the subject-matter

### Electrical Phenomena.

The attraction and repulsion of earthly bodies, to or from a given point, or the mechanical movement of the same, is spoken of under the head of earthquakes, or volcanic eruptions. The theories advanced in regard to the agencies which cause these disturbances are based upon the best of knowledge, and laws which are acknowledged to have had an existence since the world began. But may it not be that there are other and additional laws, besides these most popular with geologists, which have much to do with the phenomena of volcanic disturbance, if indeed not all to do with it in some instances. The power of the wonderful and mysterious agent known as electricity, which pervades all space, water and earthly bodies, is but partially known. Yet it is found to be a vital element in nature, creating life or destroying it just in proportion as it is come in contact with. Whether evolved from the action of acids upon the particles composing metals, as in the case of the voltaic battery, or by the friction of matter in the revolution of the earth, does not seem to be definitely known. That the portion of it with which the earth is charged is received at the poles, and by this pressure forming of the earth an oblate spheroid, is a fact, we are told by scientific scholars, which is established beyond hypothesis. And being then discharged at the equator, or belt of the earth by its ceaseless round of revolutions, it must pass through every body, seam and substance which compasses the entire mass. Understanding the character, or power of electricity, so far as it is understood, leads one to ask whether the phenomena of volcanoes, earthquakes, and the like, cannot be traced directly to this agency, instead of attributing these disturbances to the action and result of that internal heat which is said to ever exist and earth's centre in a fiery mass of molten matter.

It is well known that electrical currents will traverse lines or bodies for which they have the most affinity. For instance, metals, water, moist substances decayed animal and vegetable matter—while they are repulsed by glass, resinous substances, silk, air, hair, &c.—and if, in the passage of these currents from the poles to the equator, they traverse a large field of conductive matter, and by sudden contact with repulsive or non-conductive material, are made to flow through a small space of matter for which they have affinity, heat would ensue, and if the matter so condensed was of a combustible character volcanic action at once takes place. Here we have one cause for eruptions which does not owe its origin to the original fire claimed to exist in the centre of the earth, and a cause fully as powerful as any other, with a constant supply of force to keep it burning where the character of the material is at all combustible.

Reference to the ordinary telegraph in use will illustrate the point plainly. A number nine wire, such as telegraphs are constructed with, will carry a current of electricity from a Grove battery of fifty cups, from two to three hundred miles, and work smoothly. If the distance be shortened it will work stronger, so that by adding battery and decreasing the distance a current of electricity can be evolved sufficiently strong to melt the wire, and if a strong current is used, and the wire should be broken and the two ends connected by means of a fine platinum, which is susceptible of great heat without melting, the electricity in passing over the platinum would be condensed to so small a body or surface as to evolve sufficient heat to contribute combustion to powder, or any light combustible substance which might come in contact with it. It is upon this principle that sub-marine batteries are exploded, and ignition contributed to objects which cannot be directly reached with a burning match or supplied with a percussion.

Here then, if we admit that there are combustible

substances throughout the centre of the earth—if we admit that the earth is charged with electricity, which traverses from one point to another in such manner and directions as its affinity directs—and if we admit that a sufficient body of electricity can be condensed upon an object to contribute combustion to it—we must also admit that we have sufficient cause for earthquakes, volcanoes and hot springs, without attributing it entirely to the effect of the molten mass which is said to exist in the centre of the earth.

### The Electric Age—Another Ocean Cable.

The unprecedented success of the Atlantic cables, both as regards insulation and patronage, has surprised capitalists and opened up new fields for investment. The result is that capitalists are eagerly rushing into all submarine cable schemes that promise large dividends. Indeed, it may be said that this is the era of electricity, and it is not too much to predict that before twenty years have rolled by the whole civilized world will be united in a network of cables and land lines, by which the patrons of the Paris, Hong Kong, London, Madrid, Moscow, New York, San Francisco and other newspapers of the world can peruse the events recorded from all corners of the earth twenty-four hours after their occurrence.

We have now, besides the Cuba cable and many other small ones, two Atlantic cables in operation, a third one on the eve of construction from France to the Island of St. Peter's and thence to the United States, and at the present time a company is being organized in England to submerge a fourth cable across the Atlantic, of which Brest, France, and New York will be the termini. This company is called the "Franco-American Submarine Cable Company," and will organize with a capital stock of £900,000 sterling. One third of the stock and the Directors will be given to England. One-third to France and one-third to the United States. The books have been opened in England and its share of the stock subscribed. The French bankers, it is said, have guaranteed the subscription of another third. A contract has already been made with the India Rubber and Gutta Percha Telegraph Company of Silvertown, London, for the manufacture of three thousand seven hundred miles of cable which will support itself in water a distance of thirty miles. The contractors have taken the English subscription as an advanced payment, and will at once proceed with the manufacture of the cable, which will probably be laid next summer.

This new company have received valuable concessions already, including one from the French government, giving them for five years all transatlantic business coming this way that touches French wires, and one from the Submarine Telegraph Company across the English channel, who agree to give them all the messages that touch their wires *en route* to Brest.

But the great advantage claimed by this company for the public is expedition and cheapness in the transmission of despatches. Having a direct line of submarine cable, the time consumed in repeating messages between New York and Heart's Content will be saved, and it is understood that the tariff will be but one shilling sterling per word. It is expected that at this rate the company will secure sufficient business to occupy the cable twelve hours of the twenty-four. A good operator will send or receive fifteen hundred words per hour, yielding a revenue of nine hundred pounds per day, or two hundred and seventy thousand pounds per year. It is estimated that the expenses of running the line will be about seventy thousand pounds per year, leaving net profits two hundred thousand pounds, or twenty-two per cent. of the capital stock.—*Herald*.

Why is a cable operator like a coquette?

Both look in the mirror for reflection and pay great attention to the sparks.

### Electricity and Vegetation.

M. Blondeau states that subjecting fruits—apples pears and peaches—to the action of an induced electric current—hastened their maturity. Having rendered seeds good conductors by moistening them, he affirms that electrifying them by induced currents causes them to germinate earlier than similiar seeds not subjected to such action. He says "some haricot beans which were electrized exhibited a singular, peculiarity. They germinated *head downwards, and root upwards in the air!* That is to say, the gemmule, surrounded by its cotyledons remained in the ground, while the root, separated by a little stem from the gemmule, erected itself in the air. This fact appears important, as explaining the reason why plants push their roots into the earth and their stems into the air. This tendency is so strong that efforts to cause them to act otherwise are fruitless; but it may be overcome by the electric shock in the same way as the poles of a magnet may be reversed. We are tempted to liken the embryo to a small magnet with opposite poles."

### International Courtesies.

LONDON, Dec. 24.—At a banquet given at the Royal Polytechnic on Saturday night last, in reply to the following sentiment from the Duke of Wellington, a felicitous telegram from the President of the United States was read, amidst great enthusiasm. Not a little of the interest attaching to these despatches grows out of their rapid transmission.

LONDON, Dec. 21.—The Duke of Wellington, the directors and the scientific guests now at the Royal Polytechnic, London, Eng., send their most respectful greeting to the President of the United States, their apology being that to the discoveries of science the intercourse between two great nations is indebted.

WASHINGTON, D. C., Dec. 21, 1867.—To the Duke of Wellington, London: I reciprocate the friendly salutation of the banquetting party at the Royal Polytechnic, and cordially agree with them in the sentiment that free and quick communication between governments and nations is an important agent in preserving peace and good understanding throughout the world and advancing all the interests of civilization.

ANDREW JOHNSON.

The reply occupied twenty-nine minutes in actual transmission. On the same evening a message of twenty-two words was started from the Polytechnic for Heart's Content, at exactly 9 P. M., and at ten minutes past 9 the reply, of twenty-four words, was delivered.

### Simplification of the Galvanic Battery.

It has been found by M. Manuelli Giacomo, that sulphate of zinc may be substituted for the sulphate of copper in a Daniel's battery and without lessening its power. The effect of such a substitution is a considerable saving of expense, since the cost is merely that of zinc consumed. He found, also, that a very good galvanic current will be produced if zinc is substituted for the copper of the battery. In this case, zinc constitutes both the electro positive and electro negative metal.

### The Atlantic Cable.

LONDON, January 11.—The directors of the Atlantic Telegraph Company have issued a prospectus to raise one million three hundred thousand pounds sterling, to purchase all the rights and interests of the Anglo-American Telegraph Company in the two cables across the Atlantic, between Ireland and Newfoundland, and to pay of their indebtedness.

A telegraphic dispatch from London, dated December 1, at two o'clock A. M., was received at St. Paul, Minn., at half-past ten o'clock on the night of November 30.

## Correspondence.

## Cable Alphabets.

FORT WAYNE, IND., Dec. 18, 1867.

J. D. REID—DEAR SIR—It is just possible you may remember, some many years ago, a Wheeling "Jones," and to whom you had the generosity to be kind. I have managed, perhaps, by better luck than merit, to retain position until the present moment.

I have spent the greater portion of my life in pursuit of the high speed automatic system of telegraphing automatically, repeating over any number of circuits and printing at the last.

The purpose of this paper is other, however, than that, and I can hardly explain how I hope that you possibly may be induced to aid me and further my endeavors in pursuance of my next project.

I understood very lately that the cable folks were using the dot and dash system, as also the rather long European telegraph alphabet. Some three years ago I invented a cable alphabet, but the matter went by with little attention, on the apparently fair presumption that with the combined genius of European scientific men, with their advantages of being conversant with so many facts not in my possession, they could not have avoided finding the best possible system of operation.

The mechanical expedients for practically operating my system are of late date.

In estimating the rate of respective systems I use the dotting time as a unit of measure. Assuming any certain number of dots a minute as the standard—even in length, with even intervals between each. Now, any system rated by this standard must make good the condition that no impulsion must succeed a previous one more rapidly or abruptly than would occur in said even run of dots.

By estimate I find the European alphabet to require a lapse of time equal to 3 62-100 dots per average character, allowing in spaces and periods.

By estimate I find the Jones cable alphabet to require a lapse of time equal to 1 93-100 dots per average character, allowing in spaces and periods.

Unlikely as this may appear I undertake to substantiate it about as stated:

The system requires for its success isochronous revolutions of a shaft at each end, two revolutions to each dot, with a coincidence of initial position at the same instant of time, something similar to the combination system.

The result is obtained in this: each shaft governed by a high speed; centrifugal friction governor, true to an error of not over  $\frac{1}{2}$  per cent. error in speed; also the main shaft being forced to observe the determination of a chronometer balance of the best class, true to the fraction of a second per hour; a gain wheel device feeds in a very small fractional advance, when at any stroke of the balance the centrifugal wheel will be found at an error behind its proper position.

The circuit master may also apply a small correction in time when he determines by the average movement of the waves, it is needed.

The positiveness of the strokes, and the absolute precision of the measurements, together with a peculiar facility in the determinations concerning the waves by the observers, is apt to justify an advance in the rate of dots from that element alone.

Yours, very respectfully,

C. K. JONES.

Reply by C. P. Varley, Electrician.

DEAR SIR—Mr. J. D. Reid has shown me your note of the 8th, with which I am much pleased.

I see you have naturally, in the absence of a good account, supposed that the Atlantic cable is worked by dots and dashes. It is really worked only by dots, viz.: right hand and left hand movements.

I will explain briefly why such an instrument as

you propose could hardly be employed on the Atlantic line.

First, all cable people like to work with a very small battery power, so that should an escape show itself the cable may not be injured by strong currents passing in and out of the escape.

Secondly, the speed of transmission, with the apparatus employed, is not augmented by increase of power; that is to say, one cannot make distinct waves arrive at the distant end more quickly by means of 100 cups than with ten or one. The reason why ten cups of Daniels battery are used is because we avail ourselves only of  $\frac{1}{100}$  part of the full power of the battery, and so the signals are really only of that strength which the one-tenth part of a cell would produce.

The current arrives at the distant end of the line gradually; an appreciable time elapses before the current attains strength enough to move the most sensitive galvanometer, and when it begins to arrive, it rapidly augments in strength, and gradually approaches to, but never actually attains its full or maximum strength. On land lines this period is too short to be noticed by ordinary apparatus, and the current seems to arrive at the distant end instantaneously, but it is not really so.

The accompanying sketch shows the rate at which the current augments in strength; also the rise and fall of the current when working a Morse instrument on a submarine line, by which you will see how much quicker my method of working is.

We get by our present mode 11 words a minute, and when the business requires more speed our curb key, &c., will augment the speed to 16 or 18 words a minute.

In the diagram you will see the rise and fall necessary to produce a dot and dash without the curbing apparatus.

The little wave shows the one actually in use, and but for a most sensitive instrument it would not be perceived.

Very truly yours,

CROMWELL F. VARLEY.

Telegraph Keys.

To the Editor of the Journal of the Telegraph—

Is it not a little singular, that in the midst of the very great improvements which have been made in the machinery of the Morse system during the past ten years, so slight attention should have been given to the important subject of keys? While relays and other receiving apparatus have bounded from semi-barbarism to something like mechanical perfection, so that the jury of the Exposition could say that the collection at Paris last summer was superb, the transmitting instrument of to-day is almost identical with those used in the times when telegraphing "tried men's souls."

Notwithstanding the continual growl of operators over imperfect manipulation; notwithstanding even the innumerable mistakes, due in larger measure to the imperfection of the instrument than the carelessness of the man; notwithstanding wretched connections with their added resistance—telegraph instrument makers and telegraph companies have apparently made up their minds that "anything will do for a key."

The faults of our present instruments are both of scientific design and mechanical construction: they are dangerously—sinfully imperfect. In my own slight personal experience I have known of more perplexing and difficult-to-locate troubles in keys, than in any other part of the line. I remember on two separate occasions, and in different offices, being nearly an hour in determining the existence of an escape in keys, of which I was all the time morally certain.

In the small space which you could spare me, it would not be possible to touch upon all the points

where improvement is demanded, and I shall refer to but two—

If one could be perfectly sure of no lateral motion, the present style of pivoting the lever, by trunions near its center, would not perhaps be so objectionable, but when the contrary is the case, when we are convinced that there is a very considerable side force, limited only by the temper of the operator, it appears to me, the folly of it is evident. Moreover the pivoting screws are adjustable, and hence each operator works them at a different tension—some of them so loosely that the electric force must be in a sad way to find a path for itself to come to time—and if it don't, always, is it very remarkable that the confusing "odd" dots will occur? The screws themselves have their threads cut, in a great many cases, with a perfectly bewildering want of accuracy. The trunions, too, being of iron, help the matter amazingly in a damp atmosphere, or when some of the careful operators seek to diminish the friction with oil!

The jumping of the lever in its pivots finds an admirable correlate in the graceful recoil of car wheels upon most of our railroads, and the effect is precisely the same in both cases. To the man who initiated the present system of circuit closers, immortal honor is due. Were it possible to make an alloy of brass and leather, a medal in this substance only would be fitting tribute to his transcendental genius. It appears to me there are few men who could have originated this tremendous absurdity, and solely on the grounds of its greatness can be reconciled the fact of its continuance. The simplicity which expects a helicoidal lever between two and three inches long, pivoted at its extremity, to move in a true horizontal plane, under the direction of all sorts of forces and at the same time always preserve sufficient elasticity to close the circuit, is something marvelous and grand.

What is especially needed is a self-circuit closing key, taking the discharge between platinum points, one which having the necessary mechanical simplicity and strength, will be no outrage on the over-worked galvanism, a thoroughly reliable, accurate, safe instrument.

It does not seem probable that the mechanical operators proposed by Wheatstone and others will ever be much, (if at all) used in this country, linked as it is with the customers own translation, and I submit that some thought should be expended on the improvement of our transmission apparatus in which we may look for security from "open" lines and "bulls."

Very respectfully,

PHILADELPHIA, Dec. 26, 1867.

T.

## Weather Reports by Cable.

JANUARY 10.

We are able to add to-day to our weather reports, an item from Newfoundland and another from Ireland. The request for this information was sent from New York at precisely 10 A. M., and the replies were received and delivered in this city in fourteen minutes, as follows:

HEART'S CONTENT, Newfoundland, January 10—3 P. M., Greenwich time—Snowing.

VALENCIA, Ireland, January 10 3:02 P. M.—Wind south—Raining.

BELFAST, January 10.—The clerks in the office of the Magnetic Telegraph Company in this city have been arrested and thrown into jail, on the charge of belonging to the Fenian organization.

The Russian Government, it is reported, has granted a concession to parties in London and Berlin, for the construction and working, within the Russian territories, of a direct line of telegraph between London and Italy, a large portion of which will pass through Russian territory. The concession is granted for twenty-five years, dating from the commencement of the line's effective working.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID,  
145 Broadway, New York.

NEW YORK, JANUARY 15, 1868.

### Western Union Co. Exhibit.

On our first page will be found a carefully prepared exhibit of the affairs of the Western Union Telegraph Company during the past eighteen months. It is the first of the kind made for some time. Of this reticence many have been inclined to complain. With more or less urgency a publication of the operations of the Company has been requested, but has been quietly and persistently declined.

Nor were arguments wanting for the non-publication of its affairs. With all its success, the history of the Western Union Telegraph Company has been a struggle. It has had to do and dare that which a fastidious and timid outside sentiment would have embarrassed and perhaps prevented. The policy of uniting weak and minor lines in one, so as to connect the points of profit—the commercial centres—under a unique authority, at first contemplating only the combination of a few interests in Ohio, Michigan and Illinois, gradually asserted a wider application. With the opening knowledge of the capacities of the electric current to project itself to far distant points, the boundaries of separate telegraph companies became offensive. The spark which could be lit on the Pacific by a finger on the Atlantic, demanded freedom from the repetitions it might have been required to make at the gateway of each intervening State. To secure this required large sums of money, which a narrow and greedy policy would have divided in dividends, and which would have inaugurated a contemptible system on which no great future either for the Telegraph as an element of power and usefulness or the Company could have been reared. With the publication of all its plans and movements and expenditures would have come a hurricane of hungry, yelping invective, which it was wisdom to confine.

The time has now come when these exhibits can be made. This journal will be the medium of their publication, together with all such fragmentary items as may be deemed desirable for those who are interested in the progress of the Company to know. It seems unnecessary to say that every person holding a share of stock should secure this paper. The present number is sent free to them, but the current information hereafter provided must be obtained by subscribing for it. One dollar per annum, an amount sufficient to cover its cost, will secure the reception, twice a month, of not only the distinctive information alluded to, but a mass of interesting items, gathered from the choicest sources, of electrical phenomena, and the spread of telegraphs throughout the world.

Of the statement which we to-day present we have little to say. Yet there are a few salient features to which we call attention, and which may aid some unaccustomed to the array of figures the exhibit presents in understanding the points they are intended to illustrate.

I. The actual nett earnings during the eighteen months covered by the exhibit is shown to be \$3,849,448.97, equal to an annual dividend of six and a half per cent. per annum. This result is obtained after deducting all ordinary expenses and the cost of all the class of expenditures coming under the head of "reconstruction."

II. The deductions to be made from this income may be classified as follows:

1. To be used annually in cancelling bonds.	\$240,000
2. Interest on bonds, of which the amount is being reduced by their extinction.	840,000
3. Cost of construction—estimated.	400,000
Total.	\$980,000
Net annual earnings—say	2,869,448.97
Leaving for dividends, or about four per cent. per annum.	\$1,120,000

III. The amount paid for new property during the past eighteen months was \$1,500,000—leaving, January 1, 1868, after paying a two per cent dividend in July, a credit balance of \$264,944.79, as shown in the Treasurer's statement.

IV. The obligations of the Company are \$4,946,800, \$89,000 of which matures in 1873, and \$4,857,800 in 1875, one half of which will be paid by the monthly absorption now going on.

The exhibit must impress all who study it with the magnitude of the trust reposed in the hands of the officers of the Company, and the necessity of the most unremitted energy in the management of its affairs. It ought to moderate expectation, to prevent discouragement, to discourage speculation, and unite all in securing that success which can only result from united counsels and persistent toil.

### Presentations.

We record, with great pleasure, the account on the succeeding page of the presentation of a valuable gift to Superintendent R. C. Clowry, of St. Louis. These are the things which unite and strengthen men in their work. To no man in telegraphic harness could such a gift be more worthily given. Prompt, clear-headed, executive, faithful, persevering, Mr. Clowry is a most valuable aid in the management of Western Telegraphs. He enjoys the fullest confidence of his Company, and we are exceedingly pleased to see the evidence of the esteem in which he and his estimable lady are held at home. Long may they live to enjoy it.

Mr. C. S. Jones, operating manager at Albany has also come in for his share of good things. On New Year's day he was presented by his operators with two handsome volumes "Shakespeare," and "Loves and Heroines of the Poets." We congratulate our old friend on this token of appreciation, knowing the personal worth both of the donors and donee.

### Major W. H. Heiss.

The International Ocean Telegraph Company have given the general superintendence of their line to Major W. H. Heiss. They could not have given it into better hands. He left on Saturday last by the Bienville for Havana. He goes there to lay five miles of subterranean cable, between Havana and Cherora. His headquarters will be in Florida. The whole enterprise is a success, and there can be no doubt but that the lines thus reaching Cuba will be gradually extended until they connect the South American Republics, where, as will be seen, new lines are in process of construction.

### Sal Ammoniac.

Some eighteen years ago there came to Pittsburg from Rochester, N. Y., Mr. Gustavus Swan, now of the Astor House telegraph office, with a patent for the use of Sal Ammoniac in the composition of main batteries. He represented a company of which Hiram Sibley, Esq., was President. The use of Sal Ammoniac was to dispense with the necessity of mercury upon the zinc cups, by which undue action was prevented and yet the power of the battery maintained. So much, however, were the companies occupied in other matters that little attention was paid to Mr. Swan's mission, and, we believe, the subject was dropped.

In the last issues of the European scientific magazines we observe reference made to this use of Sal Ammoniac as a new discovery. Here is one of the items:

"Certain improvements have been suggested by M. Zaliwski Mikariki. His latest experiments show that by increasing the height of the elements, without altering their base, a current proportionate may be obtained. He recommends the following method for increasing the energy and permanency of a Bunsen's battery: Place the porous vessels one within the other. Into the first, containing the carbon or platinum, pour nitric acid. Into the second pour sulphuric acid. Into the outer vessel, containing the zinc, pour sal-ammoniac. There is no effervescence, and the zinc undergoes no useless destruction. Gelatine in battery renders copper soft, malleable—nearly equal to rolled copper."

The use of mercury in amalgamating the zinc cells of batteries reaches about 200 flasks per annum at a cost of about ten thousand dollars. If a little sal ammoniac mingled with the diluted sulphuric acid renders the use of mercury unnecessary, we do not see why it should not be employed and this expense saved to the companies who now use it. It would also much reduce the labor of battery work, and remove from battery rooms an article in the use of which there is usually much waste.

### Postal Telegraph.

We see from the Washington Correspondent of the *Tribune* that Mr. Washburne is again at work on a bill to place the Telegraph in the hands of the Government. We have already, with some emphasis, expressed our conviction on this subject, and have found no cause to change the sentiments so expressed. Once take from popular management the pursuits which give vigor to our national life, and place them in the hands of Government officials, then farewell to the enterprise which stimulates and distinguishes us as a people.

### The New York Telegraphers' Ball.

We find upon our table this morning a most exquisitely printed invitation to attend the annual ball of the "New York Telegraphers," January 24th, under the management of Mr. John Horne, Jr., chairman, at the New York Assembly Rooms. A very select company are expected, and General Burnside is looked for as one of the happy participants. We must plead great ignorance of such matters. We can't dance, although we have jumped for joy once or twice. But we hope all may be happy, and not stay out too late.

### To Correspondents.

We have in type a description of styles of key exhibited at the Paris Exposition which we desired to publish in this number to show our good correspondent T. that the subject of which he writes is not wholly ignored. We shall give these descriptions in our next. A communication from Chicago is necessarily postponed, as are several others, all of which will have attention in due time.

**George Peabody's Gift to Cyrus W. Field.**

Starr & Marcus, John Street, New York, have now ready for examination this magnificent gift. It consists of 12 pieces of solid silver, inlaid with gold, elegantly and elaborately chased, and on each piece medallions of Mr. Peabody and Mr. Field. On each article also is inscribed the following:

GEORGE PEABODY

TO

CYRUS W. FIELD,

In testimony and commemoration of an act of very high commercial integrity and honor.  
New York, November 24, 1866.

The pieces are as follows:

1. Tureen, massive and of beautiful design.
2. Epergne. Supporting the fruit or flower basin, is a solid silver figure, representing the genius of the New World standing on a globe, on which are engraved the signs of the Zodiac. On either side of the basin are Cupids—one sharpening an arrow, the other bearing a flambeau.
3. Ice bowl, supported by sphinxes.
- 4, 5, 6. Cake and fruit dishes.
- 7, 8, 9, 10. Vegetable dishes, so made as to be convertible into eight pieces.
11. Decanter, very elegant.
12. Coffee kettle, massive and of beautiful design.

All of these pieces bear the Field arms—a hand holding the globe, and bearing the old family motto: SANS DIEU RIEN.

(From the *St. Louis Daily Missouri Democrat*.)

**A Surprise Presentation.**

Colonel R. C. Clowry is well known as the efficient and popular superintendent of the ninth district of the Western Union Telegraph, and his urbanity and faithfulness are proverbs among all who have business relations with him. As the holidays have approached, the employees under him, telegraph operators and repairers, have been secretly at work arranging for the presentation of a gift worthy of their own attachment, and which should at the same time be a durable memento both to the worthy colonel and his wife also, who is a most accomplished pianist. Accordingly, they selected and purchased an elegant cabinet organ, in a rosewood case, a superior instrument of six stops, and last night was the time decided upon to present it. About eight o'clock the entire party of donors took carriages, to visit the colonel at his residence, near the corner of Dayton Street and Garrison Avenue. They were accompanied by an express wagon, bearing the organ, and on reaching the vicinity the party alighted, and called on the gentleman, who was taken by complete surprise in seeing his operators, one after another, to the number of twenty or more, file into his parlors. A few moments of pleasant chat followed, when the door once more opened, and in came the expressman and his assistants, bearing the organ, completely enveloped in a proper cover. Mr. E. H. Brown, manager of the office, on behalf of his associates, at once stepped forward, withdrew the cover, and addressed the surprised colonel in the following

**PRESENTATION SPEECH.**

COLONEL: I have been requested by the gentlemen of the Western Union Telegraph office to make a speech pertinent to the occasion which has brought us here unannounced this evening.

As the old year is drawing to a close and we are soon to leave it behind and cross the threshold of the new, we have desired to add another reminiscence to the many pleasant ones of the year, and also to couple with it in a tangible and durable form an expression of our united esteem for you as our superintendent.

The ripple of daily news starting on its telegraphic journey in the sunny climes of Egypt, and speeding its way across the face of the old continent, plunging through the depths of the mighty deep and gathering with increased volume on its western shore, pursuing its journey over and around the

cragged hills and across the broad prairies and through the mighty rivers, to the western banks of the Father of Waters; it has been our duty to pass it westward to the western shore of the Pacific, and in return to receive the ebbing of the news tide as it receded back into the sea of busy life to its distant eastern shore. And again, as the indications of the throbbing of the pulse of the great commercial centers of this and other lands have passed to and fro, or as the citizens of this city have exchanged business, family and social communications, with their immediate and distant neighbors, it has been our duty to guide and control the element that enabled us to annihilate time and space for the public in the performance of our several parts in the great telegraphic system. I but feebly express the sentiments of the gentlemen when I say that we are proud that we have been directed in our duty by a leader thoroughly and practically up with the times. The same prompt and faithful manner with which you have executed the orders of your superior officers you have demanded of us in our execution of yours. More than this was not required, less was not tolerated.

With a desire to contribute towards your recreation from the cares and perplexities of life, and also to contribute to the gifted and cultivated musical talent of your wife an additional instrument for her amusement and your entertainment, I present to yourself and lady, in behalf of the Western Union Telegraph office, this cabinet organ, with many a merry Christmas and happy New Year.

Colonel Clowry responded with brevity, but appropriately, as follows:

MR. BROWN AND GENTLEMEN: I have no words to reply suitably to this unexpected visit and this splendid present. All I can say is to thank you most heartily on behalf of myself and my wife. With regard to the feelings you have been so thoughtful as to express towards me, I must say, I do not know whether I deserve them or not. But I have always tried to secure the friendship and good will of those with whom I am in business relations, by trying to serve them as well as myself. I take your gift as a testimony of that good will, and, as I said before, I shall prize it all the more highly because it will be a source of pleasure and of happiness from its use to my wife as well as myself.

Mrs. Clowry was then very appropriately addressed, and the unanimous desire of the gentlemen present was tendered her that she might discourse to them some of the delicious music of which she is a gifted exponent, from the instrument presented. Mrs. Clowry replied by a gracious expression of willingness to gratify them, and the rich, full harmony of the organ was soon echoing through the rooms. A brilliant variation of "Sweet Home" on the piano followed, and an hour or two was spent in social festivities, after which the party returned to the city, happy in a pleasant evening and a good deed worthily accomplished. The organ bears, upon a silver plate, the following inscription: "Presented to Mr. and Mrs. R. C. Clowry, by the employees of the Western Union Telegraph Office, St. Louis, Christmas, 1867."

**New York, Newfoundland and London Telegraph Company.**

The New York, Newfoundland and London Telegraph Company have constructed, during 1867, an entire new line from Plaister Cove, Cape Breton, to Hearts Content, Newfoundland via Ash'ee Bay. Another new line has been built by the same Company, connecting the same points via Sidney and St. Pierre. This gives connection with the Atlantic Cable by three perfectly new and reliable lines. One cable, 351 miles long, between Sidney and Placentia via St. Pierre forms part of one of these routes. Two cables, respectively 85 and 89 miles long, across the Gulf of St. Lawrence, form parts of the other routes.

**Ahead of Time.**

The New York *Tribune* is not infallible to mistakes. The following learned paragraph appears in a late number:

"A telegraphic dispatch the other day came from London to Washington in nine and a half minutes. Suppose it to have kept on around the world, the circuit would have been made within an hour. What said Shakespeare? 'I'll put a girdle around the earth in forty minutes.' If the dispatch referred to above had started from London at one minute past eleven on December 20, it would have gone around the globe and arrived at its starting point by fifty-eight minutes past eleven December 19—apparently making the girdle of the earth nearly twenty-four hours before it started. 'Canst thou send the lightnings, that they may go and say unto thee, Here we are?'"

—No more would the dispatch mentioned by the *Tribune* arrive at its starting point nearly *one day before it left*, or "nearly twenty-four hours before it started," than could a gentleman leave the battery at 1 o'clock, walk up Broadway and arrive at the City Hall twenty minutes before he left the battery. If this could be done one could retrace his steps and renew his youth. Telegrams, in crossing the ocean, or the continent, from east to west, gain on the time existing at the points they pass until they have reached the antipodes, when they return, with time gaining on them, to the point from whence they start, consuming just the amount of time necessary for their transmission. If they pass around the globe of course they will pass through the night somewhere existing, but they do not get into the next day or fall back into the past. If they leave London at 12 M. they will reach the antipodes at 12:30 on the morning of the same day—allowing one hour to make the entire journey around the earth—after which it is a race with time, in which the latter makes up all it has lost except the sixty minutes consumed in transmission. Like an envelope the sun covers the earth and darkness closes the seam of the envelope behind, the day becoming brighter as advance is made in both directions from this seam. The time indicated by the position of the world would first carry the telegram back to nearly the beginning of the day when it had reached the antipodes, after which it would return, requiring just the time necessary to transmit it to bring it back to London. But according to the *Tribune's* theory, a telegram might travel around the world by the hour, gaining three days in every twenty-four hours, until it had dated itself back to the flood, or the creation. This is something entirely "new under the sun," and its discoverer should consider himself the best miracle worker who has yet appeared on the stage.—*Eric Times*.

Copper amalgam, used in the reproduction of etched and engraved plates, is made by mixing mercury and pure powdered copper in a small quantity of nitrate of mercury. Lowe obtains powdered copper by adding to a saturated solution of sulphate of copper an equal quantity of hydro-chloric acid, and placing in the mixture thin strips of zinc, when hydrogen gas is evolved and a porous mass remains, which falls into powder on being shaken. This powder, after being washed, first with hot water and then with pure alcohol, consists of particles of copper, quite freed of any oxyd of the metal. Powdered copper may also be obtained by subjecting the black oxyd of copper, when heated in a flask, to a stream of coal gas, carried in and out by means of two tubes placed in the cork.

The system of laying railways without the use of sleepers, by placing the rails directly on the ballast, which has been in operation for some time past in Prussia, is said to be quite successful. In that country it is a rule on the railways that every fifth wheel of a train must have a brake.

## Telegraph Extension.

**TELEGRAPHS IN SOUTH AMERICA.**—Two telegraph companies have been organized recently in South America. The first, the "Compania Telegrafica Nacional," capital \$150,000, has obtained a grant to establish telegraph communication between the city of Lima and the port of Callao, Chancay, Huacho and Lambayeque, 150 leagues in length, with thirteen stations. The Government has advanced \$50,000, returnable in messages within ten years.

The other is the project of an American named Adrian S. Morse, and is designed to connect Lima and Callao with the rich guano islands of Chincha, the traffic in which, it is stated, amounts to over forty millions of dollars annually. This line will be 149 miles long, having its posts of steel, and using the Brooks insulator. This company is called the "Compania Telegrafica Peruana," capital \$150,000, and has received an advance from Government of \$25,000, payable in messages. Both these enterprises are to be started without delay, most of the material having been already provided.

We derive the above facts from an intelligent letter from H. J. Dinero, Lima, to the *Telegrapher*, dated December 12, 1867.

**TEXAS.**—W. A. Wherry is constructing a line from Marshall to Waco—distance, 300 miles.

**ATLANTIC & PACIFIC TELEGRAPH COMPANY.**—The lines of this company have reached Erie, Pa., from New York.

71,688.—**INSULATING COVERING FOR TELEGRAPH AND CIRCUIT WIRES.**—Samuel C. Bishop.

I claim insulating telegraph and electric wires or conductors by means of valata or balata, substantially as specified.

71,927.—**APPARATUS FOR TURNING ON GAS.**—W. P. Wage, Barre Centre, N. Y., assignor to himself and M. Clarke, same place.

I claim, 1. The cylinder E, and the piston F, in combination with the lever D, or their equivalent, operated by the means and in the manner and for the purpose specified.

2. Lighting gas by electricity, in combination with the apparatus above described for turning on gas, as shown and described.

PHILADELPHIA, Dec. 24, 1867.

To the Editor Journal of the Telegraph:

I enclose copy of a telegraph bill rendered in Philadelphia in 1862, thinking you might find it interesting for your paper. It is about as funny as another I remember, as follows:

The Telegraph Company, Dr.  
To Haulin the fort of July \$5 00  
Which meant of course that the hauling had been done on July 4. Yours truly, D. H. B.

August 27 the 1862.

he man wat had put up the Telligraft wire, Dettter to Peter Schneider for Bording.

Johnson & Company.

Dinners,	4
Suppers,	6
29 Breckfest,	6

Johnson 3 meals at last at 19 per meals.

Oct. 22, 4 meals more.

Oct. 22, received the above in full up to date.

PETER SCHNEIDER.

An Irishman, evidently a native of Germany, offered the following message for transmission from a town in Eastern Maine:

Michael Murphy, New York.

Vy town you sent te coots? Sent fisites unt shaltz.

HANS KRAUT.

This was intended to mean, "Why don't you send the goods? Send visites and shawls."

## The Destruction of Forests.

It is stated by scientific men that owing to the destruction of the redwood forests of California, crops this year have been almost a failure in the Coast range, and from other parts of the country similar disastrous effects from the absence of forests are reported. The western prairies are rapidly changing from wet to dry, and the climate from one of great evenness to one of suddenly alternating extremes. The few forests that fringe the watercourses have been rapidly thinned out. Evaporation that in old times was gradual and constant, now goes on rapidly, and as a consequence whole districts where water was formerly abundant now suffer from the want of it. Springs and streams once valuable for the water power they afforded, have dried up, and the once fertile fields are becoming barren. Alarm is felt in New Brunswick and the Canadas also at the extensive use of forests there for lumbering. In France the Government has recognized the necessity of the existence of forests in order to prevent inundations, and a law has been passed which appropriates ten million francs, to be expended at the rate of 1,000,000 francs per year in replanting woods and aiding that work. Two hundred and fifty thousand acres of new forest are expected to be the result of this appropriation. It would certainly seem to be incumbent upon the American Congress to take some action which would tend to correct this growing evil—or rather cutting down evil. Especially should the planting of trees upon the great Western plains be promoted.

## Giving Joy to a Child.

Blessed be the hand that prepares a pleasure for a child, for there is no saying when and where it may bloom forth. Does not almost everybody remember some kind-hearted man who showed him a kindness in the dulcet days of his childhood? The writer of this recalls himself at this moment, as a barefooted lad standing at the wooden fence of a poor little garden in his native village, while with longing eyes he gazed on the flowers which were blooming there quietly in the brightness of a Sunday morning. The possessor came forth from his little cottage; he was a woodcutter by trade, and spent his whole week at work in the woods. He had come into the garden to gather flowers to stick into his coat when he went to church. He saw the boy, and breaking off the most beautiful of his carnations—it was streaked with red and white—he gave it to him.

Neither the giver nor the receiver spoke a word, and with bounding steps the boy ran home. And now here, at a vast distance from that home, after so many events of so many years, the feeling of gratitude which agitated the breast of that boy expresses itself on paper. The carnation has long since withered, but now it blooms afresh.—*Douglas Jerrold.*

## The Grandeur of the Bible.

If you have ever tried it, you must have been struck with the few solid thoughts, the few suggestive ideas, which survive the perusal of the most brilliant of human books. Few of them can stand three readings; and of the memorabilia which you had marked in your first reading, on reverting to them you find that many of those were not so striking, or weighty, or original as you thought. But the Word of God is solid—it will stand a thousand readings; and the man who has gone over it the most frequently and carefully is the surest of finding new wonders there.—*Rev. James Hamilton.*

I have for many years made it a practice to read through the Bible once a year. My custom is to read four or five chapters every morning, immediately after rising from my bed. It employs about an hour of my time, and seems to me the most suitable manner of beginning the day. In what light soever we regard the Bible, whether with reference to revelation, to history, or to morality, it is an invaluable and inexhaustible mine of knowledge and virtue.—*J. Q. Adams.*

## Interesting Electrical Phenomena.

Prof. Piazzi Smyth, in a note to the British Journal of Photography, a photographic picture, says:

"On the 21st of July I was trying the qualities of some newly prepared dry plates by taking a window view of house tops, and was surprised to find every chimney-top surmounted by a black streak or brush, i. e., black in negative, and therefore indicating light. Nothing of the kind was visible to the naked eye in the scene itself as a really existent fact, nor was any similar appearance visible on the ground-glass of the camera. The appearance, therefore, did not result from any bad action of the lens, which is a very good one. The stop employed was a small one (0.2 inches), and the definition of the developed picture was extremely sharp. Again, the appearance could not be caused by smoke coming from the chimneys, because that would hardly have been luminous; not 1-10 of the whole chimneys could have had fires below them, and either smoke or rarefied air would have drifted with the wind, which was blowing sensibly at the time, whilst the dark rays went upward straight as arrows. Again, that the chimneys as chimneys, had nothing to do with it, was shown by a similar brush or ray appearing at the top of a certain little ventilator in the roof of one of the houses shown, and not out of the parts emitting air, but from the ornamental spike at the top.

This circumstance convinced me at the time that the phenomenon was an electrical one, invisible to the eye, but abundantly visible or sensible to the photographic camera, and the occasion was perfectly agreeable thereto; for it was at the conclusion of a week of unusually hot, calm weather, and the sky had that morning become clouded with forms of clouds eminently electrical. Happily, the thunderstorm did not break in this neighborhood, being wafted away elsewhere, but had it broken here, the photograph tells exactly when the lightning was preparing to come down; and there is one tall iron chimney in the view, with the strongest ray of the whole above it, showing that that would certainly have been struck in preference to its neighbors, and, if unprovided with metal communication to the earth and water, would infallibly have caused mischief to the house to which it is attached.

"I have sent a second plate, taken six days afterward, when east wind and rain had disposed of all the electricity that had been brewing in the air; and it will be seen that although it is the same view, taken with the same camera, and with the same sort of tannin dry plate, there are no electrical brushes, or black rays, surmounting the chimney pots."

The process of galvanizing iron, as practiced in one of the leading establishments of Philadelphia is as follows: Selected sheets of iron, after being trimmed to requisite size and cleaned by a weak acid solution, are rolled smooth, then dried in an oven and each sheet placed in contact with zinc. Both metals are raised to unequal heat and thus fusion is effected. The regulation of the heat necessary to metallic combination is a point of nicety and care.

Mr. C. Tomlinson, of London, after a series of experiments arrived at the conclusion that the storm-glass was not acted on by light or atmospheric electricity, or wind, or rain, etc., but solely by variations in temperature; that is, that it is a rude kind of thermoscope, vastly inferior to our ordinary thermometer, and has no meteorological value whatever. His position may be proved by dipping a piece of filtered paper into ether, and placing it on to a bottle containing a little camphor, etc.; the cold thus generated will determine a deposit of crystals to any pattern or device we may choose to give the filtering paper.

**Scientific.****To Polish Steel.**

Mr. Stoss, a German engineer, finds that oxide of chromium is the best substance for polishing steel. The article is easily procured as it is used for painting on porcelain; or it may be prepared by heating to redness the bi-chromate of potash. The neutral chromate of potash is formed while one equivalent of chromic acid is converted to chromic oxide, which is easily separated.

**Preservation of Stone.**

Messrs. Dent and Brown, of the chemical department, Woolwich, England, have successfully used oxalate of alumina for the preservation of the surface of limestone and dolomite. A solution made of a strength proportionate to the porosity of the stone, is applied with a brush. On limestone the result is the transformation of the lime into an insoluble and unalterable compound and the precipitation of the alumina.

The French Emperor is said to be very much interested in the recent invention for discovering water on the most arid land. He has bought the machine, and personally superintends the experiments. The instrument consists of a long iron tube, terminating in a sharp point, which forced into the ground it is said, has never failed within a few minutes to bring water to the surface.

**A Remarkable Invention.**

It is stated that a German glass maker has lately made a remarkable discovery. He has invented a telescope or magnifying glass, by means of which the most intricate nerves or vessels inside of the body may be seen from the outside. In fact the whole arrangement and action of the interior organs may, by means of this glass, be distinguished.

The discovery will probably be of immense benefit to mankind, as by means of it the physician will be able to determine with unvarying accuracy the nature of any particular disease, and the proper manner for treating the same.

The name of the inventor, who will probably realize a fortune from his discovery, is Gottlieb Juntz. He is very poor, but a well-read and highly intelligent man. He has an aged mother, an invalid wife, six children and a blind sister, all dependent upon him for support. His mother was well acquainted with the poet Goethe, and it was probably her many anecdotes of this illustrious person which first inspired her son with a desire to do something to win the respect and esteem of his fellow men.

The glass he has made will probably place him among the first rank of inventors, and win for him the esteem of whole nations.

By means of this invention he has already nearly cured his wife. Six months ago, a well-known doctor said she could not live, and pronounced her disease to be an affection of the heart.

Juntz, however, has now proven to him with the aid of the wonderful microscope that he was entirely mistaken; the stomach alone being the part affected.

We are eagerly looking for further information regarding Juntz and his wonderful glass.

The *Moscow Gazette* publishes the following:—"M. Bogdanywitch, who is making a journey of exploration in Siberia to study the possibility of constructing a railway in that immense province, has sent the following telegram from Omin: "The object of our expedition into Western Siberia has been attained; the information we have gathered shows by facts the brilliant future reserved for the Siberian railway. The co-operation afforded us by the Governor-general has produced an excellent effect in the country. At the commencement of the spring the line from Sarapoul to Tioumen will be constructed at the expense of the Siberians. This route will be called the Russia, China-Taschkent Railway."

**Telegraphers'****Mutual Life Insurance Association.**

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment card, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

J. D. REID, Treasurer.

**DIRECTIONS TO APPLICANTS.**

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing *one dollar and a half and a three cent postage stamp for each application*, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

**JOURNAL OF THE TELEGRAPH.**

Published on the first and fifteenth of each month, commencing with December 2, 1867, will be what its name indicates, a record of Telegraphic progress throughout the world.

Although issued from the executive rooms of the Western Union Telegraph Company, and liberally patronized by that Company, the discussion of all subjects of interest to the Telegraphic world will be left free in the Editor's hands, and treated upon their merits as these may commend themselves to him.

By the aid of a liberal supply of periodicals having to do with electrical science, and coming from different parts of the world, a valuable gleanings of matter interesting to all owning or using, or working or managing Telegraph Lines will be provided. In this the Journal will be much aided by correspondence from experts both at home and abroad, who will keep it fully posted on electric subjects.

What it will advocate, or what oppose, it is not necessary to say. Warmly attached to the business as one of the most useful agencies known to the world, its care and purity, and adaptation to the wants of civilization will be the pre-eminent design. All communities should feel that in the Telegraph they have a common interest, and that national greatness, universal peace, world-wide sympathy and social happiness is largely dependent on its use and possession. This feeling will be fostered as vigorously as it is felt.

To those holding stock in Telegraph Companies the JOURNAL should have value. It will not be an advertisement for everything which any Company does or designs, but it will convey from time to time exact and truthful information respecting its business and condition, which must make it acceptable to all in any way connected with its interests. Even to those who do not hold stock, and for mere purposes of information, the JOURNAL, furnished at so trifling a cost, should be an acceptable and essential part of their means of general information.

To managers and operators, and all engaged in the service, we can only say that our interests are the same, and no man feels the ties of brotherhood stronger than the Editor of this new medium of intercourse between us. We shall use our liberty freely and frankly and kindly, and shall be happy only as being the means of good and blessing to others. It is no part of our nature to abuse or destroy. But it may be our duty to speak positively of evils thoughtlessly engendered, with a view to the ultimate good of all. We shall claim liberty to discuss all things freely, yet hope never to say that word which shall needlessly cause offence. Those only who demand a monopoly of opinion will find the opportunity for dissatisfaction.

Correspondence, brief, practical, sketchy, sensible, will be received gladly.

**TERMS OF SUBSCRIPTION:**

One Copy per Year, . . . \$1 00  
Five Copies, . . . 4 00  
Single Copies Five Cents.

**IMPROVED TELEGRAPH INSTRUMENTS.**

Having adopted the use of

**OREIDE METAL,**

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed. His Relays were awarded

**THE FIRST PREMIUM**

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them. Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the *Aetiz*, which was patented August 15, 1885. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

**BUNNELL'S REPEATERS,**

lately patented, and now pronounced the simplest and best extant, furnished in splendid style.

**PRICES.**

Relays with helices in bone rubber cylinders, very fine	\$19 50
Small Box Relays	16 00
Same in Rosewood	17 00
Medium Box Relays	17 00
Same in Rosewood	18 00
Large Box Relays	18 00
Main Sounders same as the above, with heavy armature lever, without local connections	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys	22 00
Excellent Registers	40 00
Pony Sounders	6 75
Keys	4 50 to 6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package. ## PROFESSOR MORSE.

### Man Proposes, but God Disposes.

It may not be generally known that but for one of those accidents which seem to be almost a direct interposition of Providence, Prof. Morse, the originator of the magnetic telegraph, might have been now an artist instead of the inventor of the telegraph, and that agent of civilization be either unknown or just discovered. We publish from Tuckerman's "Book of the Artists," just from the press of G. P. Putnam & Son, the following reminiscence of Prof. Morse:

"A striking evidence of the waywardness of destiny is afforded by the experience of this artist, if we pass at once from this early and hopeful moment to a more recent incident. He then aimed at renown, through devotion to the beautiful; but it would seem as if the genius of his country, in spite of himself, led him to this object by the less flowery path of utility. He desired to identify his name with art, but it has become far more widely associated with science. A series of bitter disappointments obliged him to 'coin his mind for bread,' for a long period, of exclusive attention to portrait painting, although at rare intervals he accomplished something more satisfactory. More than thirty years since, on a voyage from Europe, in a conversation with his fellow passengers, the theme of discourse happened to be the electro-magnet; and one gentleman present related some experiments he had lately witnessed at Paris, which proved the almost incalculable rapidity of movement with which electricity was disseminated. The idea suggested itself to the active mind of the artist, that this wonderful and but partially explored agent might be rendered subservient to that system of intercommunication which had become so important a principle of modern civilization. He brooded over the subject as he walked the deck, or lay wakeful in his berth, and by the time he arrived at New York, had so far matured his invention as to have decided upon a telegraph of signs, which is essentially that now in use. After having sufficiently demonstrated his discovery to the scientific, a long period of toil, anxiety, and suspense intervened before he obtained the requisite facilities for the establishment of the magnetic telegraph. It is now in daily operation in the United States, and its superiority over all similar inventions abroad was confirmed by the testimony of Arago and the appropriation made for its erection by the French Government.

"By one of those coincidences which would be thought appropriate for romance, but which are more common, in fact, than the unobservant are disposed to confess, these two most brilliant events in the painter's life—his first successful work of art and the triumph of his scientific discovery—were brought together, as it were, in a manner singularly fitted to impress the imagination. Six copies of his 'Dying Hercules' had been made in London, and the mold was then destroyed. Four of these were distributed by the artist to academies, one he retained, and the last was given to Mr. Bulfinch, the architect of the Capitol, who was engaged at the time upon that building. After the lapse of many

years, an accident ruined Morse's own copy, and a similar fate had overtaken the others, at least in America. After vain endeavors to regain one of these trophies of his youthful career, he at length despaired of seeing again what could not fail to be endeared to his memory by the most interesting associations. One day he was superintending the preparations for the first establishment of his telegraph in the room assigned at the Capitol. His perseverance and self-denying labor had at length met its just reward, and he was taking the first active step to obtain a substantial benefit from his invention. It became necessary, in locating the wires, to descend into a vault beneath the apartment, which had not been opened for a long period. A man preceded the artist with a lamp. As they passed along the subterranean chamber, the latter's attention was excited by something white glimmering through the darkness. In approaching the object, what was his surprise to find himself gazing upon his long-lost Hercules, which he had not seen for twenty years. A little reflection explained the apparent miracle. This was undoubtedly the copy given to his deceased friend, the architect, and temporarily deposited in the vault for safety, and undiscovered after his death."—*Scientific American*.

### The Electric Piano at the Paris Exposition.

This was regarded as a decided novelty—a piano manipulated by electricity had never been seen before. A very interesting account of a similar instrument claimed to have been invented in New York, was not long ago given in the *New York Musical Review*.

The Paris correspondent of the *Nation* says:

The instrument was in the section of machinery, and looked exactly like an ordinary upright piano. It was provided with a key-board, and could be played upon in the ordinary way, or attached to a battery and made to work by electricity. It was the invention of a Swiss, familiar with the construction of music boxes, and was suggestive in its form of that class of instruments. There was a long metallic barrel driven by clock work, over which revolved a piece of thick pasteboard in which the musical notes were cut. Resting upon the pasteboard were teeth or copper pointers just like those in a music box, each one of which corresponded with the notes of the piano. The pointers were pressed down upon the barrel by springs, and were connected at the other end with a galvanic battery. As long as the pasteboard intervened between the end of these pointers, and the revolving barrel, the current was broken and no notes are struck; but as often as the pointer came over a hole cut in the paper, it was thus brought in contact with the metal of the barrel, and the connection in the circuit was established and a note struck on the piano. By bringing these holes opposite the proper pointers, and at distances to correspond to the time of the piece, a complete tune could be played. The papers with the notes cut out looked like a pattern for weaving. Several pieces of music were performed by electricity, and the time and expression were so well imitated that any one would have supposed that the instrument was being played by hand.

### The Connection with Europe.

We have examined the files of the New York papers to ascertain how many days during the 18 months since the Cable was laid, persons daily expecting European news had been disappointed by the Telegraph. The record is as follows:

During the first six months, when the success of the enterprise found the land lines unprepared for this new and important business, there were thirty-three days on which the New York *Morning Herald* failed to publish news by the Cable. Of these, four were Sundays: there were seven days on which the news not arriving in time for the *Morning Herald*, was published in the *Evening Post*; ten days during which the lines somewhere between New York and the end of the Cable at Heart's Content, nearly two thousand miles by the route of the Telegraph line were prostrated by heavy wind or sleet storm; two days the steamer Dauntless, which at the first conveyed business across the Gulf of St. Lawrence, was detained; one day the St. Ann's Cable was broken, and the remaining nine days not accounted for.

During the next succeeding twelve months, there were but ten days, on which the New York *Morning Herald* published no Cable news. Of these, one was Sunday; four, the news arrived too late for the morning papers, but was published in the *Evening Post*; three, the land lines between New York and the Cables were broken by severe storm; and two, the lines in Ireland were broken by Fenians.

The perfect working of the Ocean Cables themselves is complete and wonderful. Not a single moment since the Cables were laid, July 27, 1866, has communication across the Atlantic ceased.

We hail the dawning of brighter achievements, when an entire year's record shall show no interruptions. For the last two months there has not been a single day that the morning papers have not contained European news of the day previous.

The lines which connect New York with the lines of the New York Newfoundland and London Co. at Plaister Cove, Cape Breton, are about eleven hundred miles long, and are worked direct and with a rapidity never before attained. The other evening Mr. W. E. Kettles, operator at Washington, sent to Plaister Cove direct, a distance of over 1,300 miles, 94 messages of 20 words each within a single hour, dropping copies at New York. The messages were received by Mr. W. Sherman at Plaister Cove, without once interrupting or requiring repetition. We believe such a rate of transmission and reception by the Morse machinery to be unequalled by any European lines, and up to the highest capacity of our present printing apparatus.

To perfect the European connection, the two lines between New York and Heart's Content must ultimately be worked as one, even if one Company is compelled to swallow the other to accomplish it. That done, we shall feel that New York, indeed, shakes hands with Europe.

Nor shall we pledge ourselves to be long satisfied with even this. The commercial centres of the world must be united in fact as well as in name. A single flash must connect London and New York, without undergoing even the manipulation of the skillful operators at Heart's Content.

est in a long series of similar events. But, as it was corrected on Tuesday, the message bears reckless inaccuracy in its very face. The total submersion of the island was reduced to a temporary disappearance during a gale—in other words, to a violent inundation of the sea.

Tortola is an island about twelve miles long. Its interior is described as a "mountain mass, broken up and furrowed by glens and ravines in every direction," and rising in its highest point 1,560 feet above the sea level. It would be quite impossible, without some investigation, to say how far up the hills the inundation reached, or what number of people might not have found refuge in their eminences from the advance of the sea. All that, under these circumstances, could have been surmised with any probability, when the telegram left Puerto Rico, was that there had been a very serious inundation, which had covered the low ground along the coast and probably destroyed many of the inhabitants. The romance about total submersion might have been reasonably suspected, when it was first forwarded, to be the fiction which it is proved to be, now that there has been time for intelligence to arrive through some more trustworthy channel than the reports of enthusiastic reporters by way of the Atlantic telegraph.—*Saturday Review*.

## Correspondence.

### Batteries and their Composition.

To the Editor Journal of the Telegraph:

JANUARY 29, 1888.

SIR—My attention has been drawn to an article in the JOURNAL OF THE TELEGRAPH for January 15, page 2, last column, and headed "Simplification of the Galvanic Battery."

The paragraph in question seems to be an extract from some European journal, but it is entirely erroneous.

The Daniells battery proper consists of two metals of different electro-motive forces—the one having more affinity for oxygen than the other.

The metals usually used are zinc and copper—the former has a much greater attraction for oxygen than the latter. If these metals are placed in water, pure and free from air, the electric current will cease almost entirely in the course of a very short time the deposition of hydrogen upon the surface of the copper rendering it almost as positive to the water as the zinc.

Mercury, which is much less positive than copper, should with zinc form a much more powerful battery, and so it does for one instant of time; but when it becomes fully covered with hydrogen it is thereby rendered temporarily as positive as the zinc, and the current is almost reduced to nothing.

Daniels' great invention consisted in ridding the less positive metal of this hydrogen by immersing it in a solution of itself, which, combining with the hydrogen, deposited a coating of that metal upon the "negative" element of the battery.

Suppose zinc placed in water to have the power of making that water positive to the extent of say 6, and copper under similar circumstances to have a power of making the water positive of say 2, and mercury of say 1, then if the copper be kept free from hydrogen the electro-motive force of the zinc-copper battery will be  $6-2=4$ .

The zinc-mercury battery,  $6-1=5$ .

The copper-mercury battery,  $2-1=1$ .

Now let us examine what takes place.

The copper plate is in a solution of sulphate of copper—the zinc in water. The sulphate of copper consists of one equivalent of sulphuric acid  $SO_3$  in combination with one equivalent of oxide of copper  $=Cu. O$ .

The water consists of one equivalent of hydrogen in combination with one of oxygen  $=H. O$ .

On closing the circuit which permits the mysterious electric current to flow, a change takes place in the solutions—the zinc having more affinity for the oxygen than the copper, takes it from it leaving metallic copper, sulphuric acid and oxide of zinc, which two latter combine forming sulphate of zinc. When, however, the copper solution is all decomposed and all the copper is deposited, the action ceases.

If now the water in which the zinc was placed be examined, it will be found to be highly charged with the very sulphate of zinc, which the article in question proposes to use as a substitute for the sulphate of copper.

The absurdity will at once appear when a zinc plate is substituted for the copper one, for here there are two zinc plates each in sulphate of zinc opposed to each other, which way then is the current to go from plate *a* to plate *b*, or the other way?

Oh! but the writer may say the one plate is in sulphuric acid the other is in sulphate of zinc.

If he try the experiment he will actually find a feeble current, *but in the wrong way*, because the zinc is not pure, and the acid exposes these more negative points which give a very feeble current in the opposite direction.

It is worth mentioning here, that the addition of sulphuric acid to the zinc solution actually reduces the electro-motive force about eight per cent., unless the zinc be well amalgamated, or if the zinc have no impurity, the loss of electro-motive force will not be so great.

Professor Daniel rested content with his great discovery. Not so Professor Grove. He propounded to Nature this question—"Can we not get the sum instead of the differences of the forces?"

His experiments elicited the reply—"Put a material around the negative plate, which has a great affinity for hydrogen, and you will succeed." He tried oxygen in various forms, and also various negative electrodes, such as gold, platinum and plumbago.

The most potent method of applying oxygen to attract the hydrogen was that of coating the negative element with peroxide of lead. Next to that he found the highly oxygenized acids, such as nitric acid ( $NO_3$ ). He likewise found that caustic potash, in contact with the zinc, was more powerful than sulphuric acid.

Other nations seem jealous of the honor so justly due to Grove, and hence, when the negative element of the battery is made of coke, they have the audacity of calling the battery by the name of Bunsen. The electroplon battery is a Grove's battery, in which the oxygen is presented to the hydrogen by means of an oxide of chrome instead of an oxide of nitrogen.

I generally use in the Grove's battery, in the zinc cell, sulphate of ammonia; it renders amalgamation almost unnecessary, reduces local action, and does not weaken the action.

If nitric acid be used in the porous cell, then I add one sixteenth of liquid ammonia to the zinc solution, and then the fumes give no trouble. Nitric acid has less resistance than the bi-chromate of potash, and sulphuric acid and hence a larger volume of current.

Modify this battery as you will—first to Daniel, but mainly to Grove, is due the credit of this most powerful battery.

There is one peculiarity in the nitric acid form of Grove's battery worthy of mention, and which I have not found in any other. On passing the current through a small external resistance, the power, after the lapse of a minute or more, actually increases considerably in volume; the reverse is the case with all others.

*Palmar qui meruit ferat.*

Truly yours,

CROMWELL F. VARLEY.

### Telegraph Keys.

To the Editor Journal of the Telegraph:

I have again to renew my plaint that nothing noticeable has been done in the improvement of transmitting apparatus during the last ten years. Before writing my last communication I had seen descriptions of the keys at the Exposition last summer, an account of the more prominent of which you published in your number of the first instant, but I do not understand how any of the ingenious machines of Siemens or Brequet are to be any use to us herein America. You are aware that although they are professedly "Morse" Keys, they are totally unlike what operators in this country are accustomed to, and necessarily so, as the Morse Telegraphs in the continents are worked with instruments which differ in everything except the more essential points. European lines use a different alphabet, in most cases polarized relays and with reverse currents. Nearly all the apparatus described in your last impression, are intended for these alternate positions and negative currents, and not one of them, except the late French "improvement?" of using the original Morse Key, *could* work American lines as now built. Hence it is I claim that my former letter was substantially correct. In the experiments on fast writing which have lately been taking place, it is proved that a few, and how few, of our operators, can send legibly and rapidly, and it was to increase that number that the "New England Telegraph Club" (wasn't that its name?) was formed. The very, very great majority of operators are, however, detestable manipulators, and far more bulls are owing to this fact, than to the foolish professional pride of receiving without a break.

The friction of the pivots and the tension of the spring, varying through such wide limits, it needs a steadier hand and a more educated judgment than can possibly be possessed by the majority of operators, to secure both swift and correct manifestation with the keys as made at present. Besides being a cause of considerable resistance in the way of "escapes," the faulty manner in which the connection is made when the key is not in use, is continually the source of open circuits; especially on those way lines where there are numerous "plug" offices, and more particularly those belonging to Railway Companies.

There is an immediate and pressing need for a self-circuit closing key, in which the contacts shall be made firmly and surely, entirely independent of the superintendence of the manipulator; and this is certainly a more legitimate field for the inventive genius of our irrepressible operators, than that of insulation, which involving, as it does, a most profound knowledge of both experimental and mathematical science, has in some wonderful manner become a prime favorite with those who are in great measure totally destitute of either.

I understand that recently a self-circuit closing key has been patented by an Ohioan, although I have not been able to secure any intelligible description of it. My present and former communication has been written, not to introduce any invention, either valuable or valueless, of my own, but by agitating the question to secure to Telegraphers a better and more reliable instrument than they now possess, which latter, my own experience teaches me, is the source of the greatest annoyance to both employers and employees.

PHILADELPHIA, February 6.

### New and Commendable Enterprise.

One hundred and ten employees of the Cleveland and Pittsburgh Railroad Company have organized at Wellsville, O., a Reading-room Association. S. R. Swain Secretary and Treasurer. We think we recognize in the name of the Secretary a telegraph companion of long ago. Success to the enterprise.

## VOLTA-ELECTRIC INDUCTION.

Faraday vs. Mr. Buell.

To the Editor Journal of the Telegraph:

SIR,—May I be allowed to say that the experiment of your correspondent, M. V. B., on Volta-Electric Induction is not so conclusive as he would have us believe; and that there may be doubts expressed as to whether the "Incorrect views" of the rest of mankind are "corrected" in his letter? It is very well understood that the secondary currents induced in a conductor will themselves produce other induction currents termed tertiary and these yet other currents; and I think we are justified by the laws laid down by Faraday, in asserting that *theoretically* these currents are infinite in number, and that their union, if such a union was at all possible, would result in a continuous current, such as Mr. Buell would have us believe he has obtained, but we are not justified in assuming that practically there will be more than a momentary current at the instant of making, and a reverse current at the moment of breaking, contact with the battery.

Had Mr. Buell not been so desirous of proving induction, he would have at once seen that the effect produced in his sounder, was the result of *conduction*; in other words, that the primary and secondary wires were in metallic contact, and that, technically speaking, his lines were "crossed." If any proof was required to render it certain that such was the case, it is immediately and obligingly furnished by Mr. B., when to show the benefit which telegraphers might expect from his discovery, he states that upon disconnecting the secondary wire from the sounder, the magnetism of the original bar was increased, and this of course he assumes at once to be the work of the induction current, which he says is circulating in the secondary wire. Now, it is plain that the secondary, conveying the same current as the primary wire, and this by *conduction* would necessarily increase the magnetic effect of the bar about which it is wrapped, upon being disconnected from a great source of resistance, viz.: the helices of the sounder, because of the increased section of conductor (in this case nearly one-fourth,  $\frac{1}{4}$ ), thus afforded the current, thus enabling it to convert into magnetism that portion of itself which was formerly doing duty in overcoming the resistance of the single, or primary wire. If Mr. Buell will therefore repeat his experiment *with other coils*, he will become convinced of the absurdity of his present results, which may be expressed in their plainest terms by saying that an induction current of high tension has a *permanent* magnetic effect on a coarse wire sounder, and but a *momentary* one on a magnetic needle.

T.

PHILADELPHIA, Feb. 6th.

## The Nova Scotia Electric Telegraph Company.

This Company owns the whole of the lines in Nova Scotia and Cape Breton, with the exception of the line from Port Hood to Aspy Bay, built under its sanction by the New York, Newfoundland and London Telegraph Company, in 1856.

The lines of the Nova Scotia Electric Telegraph Company are all under lease to the Western Union Telegraph Company, the former retaining its organization as required by law. Capital at present, \$124,600, gold.

The annual meeting for election of Directors and transaction of other business, took place at the Secretary's office, Halifax, January 15, 1868. The report of the Executive Committee and the Treasurer's accounts were submitted and passed, and the following gentlemen elected to serve for the year:

## EXECUTIVE COMMITTEE.

E. D. Meynell, Esq., President; Secretary and Treasurer, Chas. Twining, Esq.; Hon. R. B. Dickey, J. J. Sawyer, C. H. M. Black and Jesse Hoyt, Esqs.

## The Galvanic Battery.

We had in use in our laboratory a most singular looking piece of apparatus, devised by Moses G. Farmer, Esq., the well known electrician of this city. It is a new form of instrument for converting heat into electricity, and most satisfactorily does it perform its work. All that is necessary to put it into active operation is to light a gas jet, and in a few moments the electrical impulses are manifested, and the battery is ready to be set to work. It deposits metals with great facility, and the development of the agent is constant and uniform so long as the heat is supplied. It resembles a "fretted porcupine" as much as everything we can compare it with. The metals employed in its construction are antimony and copper. The strips or arms of copper protrude outward from the bars of antimony, so as to secure the cooling influence of an air current, while the gas is heating the other extremity. A portion of the heat of the flame is transformed over into electricity, thus showing the easy convertibility of one imponderable into another, and the correlation of the forces.—*Boston Journal of Chemistry.*

## Electricity in Schools.

We have just finished the reading of the account in the *Brooklyn Union* of the opening of the Adelphi Academy. The arrangements for comfort, convenience, system and effective teaching do more to characterize the progress of the age than any other of its significant signs. To one feature of the arrangement at the Adelphi, we call attention for its effectiveness and beauty. In each class or recitation room is a pleasant-toned gong-bell, which is rung by electricity, and marks the periods. Each hour is divided into three even periods. In the hall hangs a large clock, to which wires from batteries run, and then stretch through the building to every bell. The clock is so arranged that at every quarter hour the poles of the battery are brought together and the bells strike once—for warning. In five minutes thereafter, and to mark the end of the period, the poles again come in contact, this time twice in succession, and the bells are, of course, rung twice. All noise of gongs or heavy bells raising a clatter is thus avoided, and the idea of quiet impressed on the minds of the scholars.

## Russian Line Rediviva.

Perry McD. Collins, Esq., the originator of the Russian Overland Telegraph, is preparing a project of a line from the Pacific coast, *via* Sitka, the Aleutian Islands and Japan to the Amoor. The Department of the United States Coast Survey are very desirous to take observations with Sitka, and Government aid will no doubt be given to reach that point. The route to Asia *via* the Aleutian Islands is a favorite one with the Russian Government, and was warmly advocated by Count Romanoff, the Russian Minister, as well as by Mr. Collins. The great improvement in the working of cables and facility in laying them is accelerating enterprises hitherto regarded as doubtful.

## Opposition Lines.

In answer to enquiries of the extent to which opposing lines have been constructed west of New York, we answer:

1. The Atlantic and Pacific Telegraph Company have completed their lines from New York to Cleveland, *via* Albany and Buffalo, using two wires.
2. The Pacific and Atlantic Telegraph Company have completed their lines *via* Pittsburg to Cincinnati, using two wires.
3. The Southern Telegraph Company have two wires from Cincinnati to Louisville, Ky., and have poles planted in direction of Memphis to the State line *via* Bowling Green.

**FASTER YET.**—Mr. E. M. Shope, operator in Western Union Telegraph Office, Cleveland, sent 2,631 words in an hour to Edward Curry, operator at St. Paul, Minn. Distance 450 miles. Mr. Thomas S. A. Valiquet, Chicago, sent 60 messages, averaging 20 words each to Salt Lake City in 26½ minutes.

Mr. A. W. ORTON, of the Western Union Telegraph Office, 145 Broadway, New York, whose marriage we recently recorded at Rome, New York, has accepted an offer to enter mercantile business there, and left the service in which he has so long and faithfully labored. We wish him abundant success.

Mr. W. H. ALLEN for many years connected with the American Telegraph Company, a skilful operator and excellent man, has resigned his post to attend a brother in ill-health, on a voyage to the Mediterranean.

SIR DAVID BREWSTER, the pupil of Robison, Playfair, and Dugald Stewart, educated for the church but a scientific student by choice, inventor of valuable philosophical instruments, and of the familiar toy, the kaleidoscope—from the immense sale of which, owing to an evasion of the patent, he never received anything—and of the stereoscope, author of many profound works, principal promoter of the British Association for the Advancement of Science, and recognized the world over as a man of great ability and vast research, died on Monday, in London, at the age of eighty-seven.

**UNSUCCESSFUL.**—It appears that the scheme to buy out the Anglo-American Company has not been successful. At a meeting held in London, January 24, Mr. Wortley, chairman of an extraordinary meeting of the Atlantic Telegraph Company, complained of the Anglo-American Company as having obstructed the project and endangered its success. A new meeting was called for further consultation, on some day during the present month.

## Electro-motive Scarf-pins—A Parisian Novelty.

A curious application of electricity has been made by M. Trouve, a jeweler of Paris. He makes scarf-pins with heads of men, monkeys, horses, dogs, or other animals upon them, which heads move their eyes at the will of the wearer. A single wire connects the scarf-pin with the electro-motor, which is usually carried in the waistcoat pocket.

## Government Telegraphs.

Belgium has 5,395 miles of wires and 807 offices open to the public, or one telegraphic office for every 15,000 of population. Switzerland has 3,718 miles of wires and 252 offices open to the public, or one telegraphic office for every 10,000 of population. In the Dominion of Canada there are, according to Mr. Harvey's "Year Book," 9,040 miles of wires, and 497 offices open to the public—one telegraphic office to every 8,000 of population. These figures as to Canadian Telegraphs were compiled over a year ago, and as we before stated, large additions have been made within the past year, both to the number of miles of wire in use and the number of offices for public business.

It will thus be seen that private enterprise has with us so far achieved much greater results than governmental management in those countries before mentioned. As regards the tariff for messages we have been reminded that considerable reductions have been made in Canadian tariffs within the past year, amounting in some cases to as much as 30, and even 35 per cent. As was said in our former article on this subject, we trust that the Telegraph Company will soon find that still further reductions may be made to the advantage of all concerned.—*Canadian Monetary Times.*

# Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

## TERMS:

One Dollar per annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID,  
145 Broadway, New York.

NEW YORK, FEBRUARY 15, 1868.

## Darien the World's Gateway.

In the part taken by Napoleon III to establish an Empire in Mexico, we were ever under the conviction that the protection of the Latin race under which it was inaugurated, and the establishment of the Empire itself, was only a cover to a more imperial idea. Louis Napoleon carried about with him in youth, in his exile, in his imprisonments, the ideas of empire, and those speculations on the influence of geographical configuration, which to his mind, determined the future of the world. A ruler by nature, and by the inspiration of the name he bore, the chart of the world came before his eye as a checker-board on which some day he was ordained to be an imperial player.

We are not the eulogist of the French Emperor, but we acknowledge profound respect for his mental grasp. Nothing has proven this so much as the publications written in his exile, or in the gloomy enclosures of the prison of Ham. One of the favorite of these ideas was in connection with the Isthmus of Darien. Recognizing the growing greatness of this Western World, the immense traffic with India, the swarming population of China, and listening to the creaking doors of Japan as they opened slowly upon a waiting commerce, his mind was impressed with the conviction that Darien, cut through by a ship canal, was to be the gateway of a vast international intercourse. It would have been his own had Imperialism under Maximilian become an established and recognized fact. Mexico was an imperial move for the possession of Darien. That move successful, France would have checkmated the world, and held Darien as one of its most kingly possessions.

The progress of the last few years has brought the commerce of the Pacific coast into greater prominence than ever. The growing greatness of California, the opening of steamship communication between San Francisco and China, the discovery of gold in Siberia, the rapid extension of telegraph lines along China and their projection into upper Asia to meet Russia on the Amoor, all these conspire to point to the West as the great region through which the industries of the world will be united and a vast commerce flow.

But our limits prevent more than a passing allusion to these things. We are led to what we have already said by the recent demands for telegraphic connection with the Bay of Panama, and to which we now refer.

## TELEGRAPH TO PANAMA.

Initiatory steps have been taken to organize a company under the laws of the State of New York to connect the Telegraph lines of the United States with Panama, where already passes so vast a traffic with the Pacific Ocean, and which must become immense when the waters of the Gulf of Mexico are connected with the Pacific by a canal which must, before many years, be constructed. This line will

be laid via Jamaica from Cuba, and diverge from the former island to Panama on the one side, and the West India Islands on the other. At Panama this line will meet a cable already projected from Grenada and Chili; and, by the islands of the Caribbean Sea, must finally reach South America at Venezuela, connecting there with lines to Rio Janeiro and the Rio de la Plata.

The number of original corporators of this new enterprise will not exceed fifty, and be composed of persons whose names will be an assurance of integrity and success. Every corporator will be an actual subscriber to the stock, and no name be used, as is so often done, for the mere purposes of prestige or to induce others to invest therein. The object of the undertaking is to supply a great necessity, and will be prosecuted on a strictly cash basis from the beginning. No bonus for placing stock or other purposes will be permitted.

The various telegraphic structures now going up in South America under the helping hand of the governments there, give promise of an early connection with all the chief points in the South American Republics, and it is a matter of expectation that from some point on the Peruvian or Chilian coast, a cable will be laid to some point in India. Then will this patient world of ours be girdled with fire, and the sun that rises in the Orient blend with the rays which gather around its occidental decline.

The following gentlemen have consented to act as corporators and subscribers, for \$5,000 each:

D. N. Barney,	John Hoey,
Wm. T. Blodget,	Wilson G. Hunt,
J. W. Clendenin,	Charles Knapp,
James B. Colgate,	Marshall Lefferts,
Peter Cooper,	Cambridge Livingston,
W. B. Dinamore,	Johnston Livingston,
Wm. G. Fargo,	A. A. Low,
Cyrus W. Field,	William Orton,
David H. Haight,	Edward S. Sandford,
Alexander Hamilton, Jr.,	General Wm. F. Smith,
Charles Hoffman,	Moses Taylor,

## Resigned.

Not long ago it was deemed necessary to organize a Bureau of Tariffs to systematize that most perplexing branch of executive labor in connection with nearly four thousand offices scattered over the entire country. It demanded patience, vast labor, good judgment, pertinacity. Colonel W. L. Gross, then Financial Agent of the Overland Division of the Western Union lines beyond Omaha, was called to its management, and for several months with the utmost assiduity, devoted himself to the Augean work assigned him. There was promise of a speedy simplification of this vital department, the inauguration of a system simple, thorough, adjustable, intelligent. In obedience, however, to a call made upon him recently to enter again the profession of the law in his native city, Springfield, Ill., Colonel Gross has resigned his duties as Superintendent of the Tariff Bureau, much to the regret of those who called him, and has re-entered legal life. Previous to his departure, Colonel Gross received the most satisfactory assurance of the appreciation of his labors here, and we regret the departure from among us of one so genial and true.

## The New Auditor.

W. H. ABEL, Esq., formerly auditor of the American Telegraph Company, and since the consolidation of the Companies, acting as assistant Secretary of the Western Union Telegraph Company, now fills the Auditor's chair of that Company made vacant by Mr. Chapman's resignation. Mr. Abel brings youth, vigor, and a clear and active head into the service of the Company, in duties respecting which he has great familiarity and acknowledged competence.

The Executive Circular, respecting opening and closing of offices, will be found on page 7, having been crowded out of its proper place.

Frank L. Pope, in a graceful valedictory, has resigned the editorial chair of the Telegrapher. Mr. Pope was an able, industrious, and skilful man, whom we always held in the kindest regard, and for whose future we desire to join with all his friends in desiring that it may be sunny and successful. His successor is not named, but is understood to be Mr. Ashley, an attache of the New York press.

The *New York Herald* is amusing itself in endeavoring to make the public believe, that the Western Union lines are for sale, and have been offered to Government for sixty millions of dollars. We need hardly say it is false, and designed to accomplish purposes of its own.

The *Pall Mall Gazette* of the 17th January contains the following item:

"A proposal has been made for the submersion of a submarine cable between Callao, Guayaquil and Panama. Communication would be effected with Europe by this means in thirteen days, and this time would be reduced to a few hours if Panama were united to the Atlantic cable."

## William M. Swain,

One of the founders of the Philadelphia *Public Ledger*, died in that city February 16th, after a long illness, at the age of 59 years. For eight years he was President of the Magnetic Telegraph Company, and many years a director in the American Telegraph Company. To us this death is the loss of a rare personal friend, one who, in dark days, stood by us our truest and firmest defence.

The publication of the following order has compelled us to lay aside much interesting matter, and greatly delayed our issue.

## Atlantic Cable and Cuba Business.

### EXECUTIVE ORDER No. 58.

**Tariff and Rules for Atlantic Cable Business.**  
Furnished by the Anglo American Telegraph Co.

THIS ORDER SUPERSEDES ALL PREVIOUS INSTRUCTIONS.

All Messages Must be Prepaid.

**Tariff in GOLD to any Point in Great Britain or Ireland.**

	10 words or less.	Each additional word.
From New York City, Boston and the Provinces of New Brunswick and Nova Scotia, - - -	\$25 00	\$2 50
From all points in New England except Boston, - - -	26 00	2 58

All other points on the Western Union Company's lines will add to the rate from New York City, viz.: \$25, and \$2.50 their rate to New York City.

For example: the tariff from New Orleans to London on a message of 10 words is \$25—plus the tariff from New Orleans to New York, \$3.25. Total, \$28.25, gold:—on a message of 12 words from Washington to London, \$30—plus the tariff from Washington to New York, 87 cents. Total, 30.87, gold.

### RULES FOR CHECKING, COUNTING, ETC.

**RULE 1.—Checks.**—You will state in the check:

1st. The Prefix. See Rule 3 concerning Prefixes.

2d. The number of written words in the entire message, including address, date and signature.

3d. The number of letters in the entire message including address, date and signature.

4th. The number of words charged upon.

5th. The amount charged.

### RULE 2.—Counting.

The date, address and signature will be sent free to the extent of five (5) written words. Each word above five in the address, date and signature is to be counted as a single word without regard to the number of letters it contains. The number of words in the body of the dispatch will be determined thus:

1st. Count the number of written words.

2d. Count the letters and divide by five, regarding each five and fractional remainder as a word.

The greater number of words thus obtained will be the number of body words.

The entire number of words to be charged upon will be the number of body words thus determined, plus the excess of words above five in the address, date and signature.

The words allowed for address, date and signature cannot be used for any other purpose than the *bona fide* name of sender, receiver, place from and to, and date. It is absolutely required that the name of sender and place from, be inserted: but the date may be added or not at option of the sender. The sender is responsible for an insufficient address, and any corrections or alterations can be made only by a new message, which must be paid for.

Compound names of Countries, States, Islands, Cities, Towns, etc., and compound words, count as one word.

F. O. B. when written thus, "fob," counts as one word, but when each letter is separated thus, F. O. B., counts three words. C. F. I., or C. I. F., must be charged as three words, however written.

Numerals, whether expressed in figures or words, must be counted each numeral as a word—as 14885—five words, one, four, eight, six, five.

Count prices sterling under one shilling as twopence, threepence, as one word.

**RULE 3.—Prefaces.**—The check on each message must begin with one of the following prefixes:

Prefix 'M,' for ordinary mercantile messages.

Prefix 'C,' for cypher messages.

Prefix 'G,' for Government messages.

Prefix 'G. C,' for Government cypher messages.

Prefix 'P,' for ordinary messages with answer paid.

Messages prefixed 'G,' and 'G. C,' take precedence.

All other messages go in order of receipt.

**RULE 4.—Cypher Messages.**—by which are meant messages consisting of letters, grouped or otherwise, not forming any known or dictionary words, or of numerals, will be counted, each letter or figure, as a word. When cypher is intermixed with plain words, the plain part of the message will be charged at ordinary rates, and the remainder as cypher.

**RULE 5.—Government Cypher Messages** must consist exclusively of numerals or letters, and not be intermixed with plain words. They will be counted as follows: If not in groups divide the total number of letters or figures by four (4), and regard each four and fractional remainder as a word. If grouped, count each group of four or less as one word—over four and up to eight, two words, and so on.

The address, date and signature of Government cyphers must be written in ordinary language. Each word will be counted as one word, and five sent free, as in ordinary dispatches.

These rates are for unrepeated Government cypher messages, and no claim respecting errors can be investigated.

Double rates must be charged if these messages are requested by the sender to be repeated.

**RULE 6.—Packed Messages,** by which are meant messages containing several separate messages combined as one, will be charged three times the ordinary rates.

**RULE 7.—Abbreviations.**—Words must be written in full. Abbreviations will not be allowed, except such as are in ordinary use, as Co. for Company, St. for Saint.

**RULE 8.—Answers** may be prepaid as follows: The sender must insert, immediately after the address, and pay therefor, the words "Reply — words, paid." The number of words paid for will be written in the blank space. Should the reply contain more words than the number so specified, the sender of the original message must pay the additional charge on its receipt. The reply must be presented for transmission not later than fourteen days after arrival of the original at delivery station.

**RULE 9.—Repeated Messages.**—Messages may be repeated back from the station to which they are destined to the originating station, for double tariff.

Should the receiver of a message require it to be repeated, on account of supposed error, the application for repetition must be addressed to the sending station. Such application and the reply must be treated as two distinct messages and be prepaid by the applicant. Should an error be discovered, the charges for the application and reply will be returned.

**RULE 10.—Postages.**—Messages destined for places beyond the line of telegraph must contain instructions from the senders as to the places from which they are to be posted; such instructions to be inserted immediately after the address, and to be charged for as a part of the message. Fifty cents, gold, must be charged extra for postage in such cases.

In messages for China the words "Post Galle," or "Post Kischti;" in messages for Australia the words "Post Galle," and in messages for Gibraltar the words "Post San Roque" must be inserted and counted. The Galle route is best for

China business. Charge Ceylon rates on messages sent *via* Galle.

**RULE 11.—Complaints.**—All complaints respecting irregularity in transmission or delivery of messages must be made by the sender, in writing. In cases of delay or error, the complaint must be accompanied by the receiver's copy of the message. In cases of non-delivery, a statement in writing from the person to whom the message was addressed, to the effect that the message has not been received, must be furnished with the complaint.

The following notice is appended to the Tariff Sheet of the Anglo-American Telegraph Company (Limited):

**NOTICE.**—The public are informed that the Anglo-American Telegraph Company (limited) will not incur or accept any liability whatsoever, either for the due transmission of telegrams to the cable, or for their safe delivery at their destination; nor will they accept any liability arising from delay or stoppage, by reason of any accident to the cable or instruments. The company will not consent to be liable, under any circumstances, for any sum whatever, as damages or otherwise, for loss resulting from errors, mistakes, delays or other causes, in respect to any message entrusted to them, beyond the return of that portion of the charge accruing to the company out of the amount received, and then only in case the message should fail in transmission when in the hands of the Anglo-American Telegraph Company (limited).

#### TARIFF TO PLACES BEYOND GREAT BRITAIN AND IRELAND.

Messages to places beyond Great Britain and Ireland must be charged the following rates in addition to the tariff above stated:

For 20 words or less, including address, date and signature—	
Havre, Rotterdam, Amsterdam, Antwerp, Brussels, .	\$ 1 00
Paris, Cherbourg and the Channel Islands, .	1 25
Berlin, Vienna, Frankfurt, Hamburg, Brest, Bremen, .	1 50
Marseilles, Stockholm, Gothenburg, Copenhagen, .	2 25
St. Petersburg, Florence, Constantinople, Odessa, .	
Christiana, .	2 50
Algiers, Madrid, .	3 50
Lisbon, Oporto, Gibraltar, Corfu, .	4 25
Tripoli, .	7 50
Alexandria, .	12 50
Cairo, .	13 50
Suez, .	15 50

To other places in following countries:

To points in Holland, Belgium, Switzerland, .	1 50
France, Prussia and Austria, .	1 75
Denmark and the German States, .	1 75
Russia, Italy, Turkey, .	3 00
Sweden, Norway and Greece, .	3 00
Algeria, Spain, .	3 75
Portugal, .	5 00
Turkey in Asia, .	6 13
India, China, .	26 25
Ceylon, .	27 50

For each 10 or fraction of 10 words above 20, charge in addition one-half of these rates.

Determine the number of chargeable words by count of actual words, and by count of letters, and division by five in entire message, including address, date and signature.

Compound names of countries, places, &c., count for as many words as they contain.

F. O. B., C. I. F. and C. F. I. must be charged as three words each, however written.

Two pence, three pence, &c., count as two words in each case.

In all other points, rules above stated for messages to Great Britain, apply.

**Tariff and Rules for Cuba Business, furnished by the International Ocean Telegraph Co.—All Messages Must be Prepaid.**

	20 Words or less.	Each add'l word.
From any office west of the Mississippi River, .	\$15 00	\$0 75
From any office in the Provinces of Nova Scotia and New Brunswick, .	12 00	0 65
From any office in New England, .	11 00	0 55
From any other office of the Western Union Telegraph Company, .	10 00	0 50
To places in Cuba other than the City of Havana, as per list, an additional charge, in gold, must be made, as follows:		
For a message of 20 words or less, .	75 cents	
For each additional 10 words or fraction thereof, .	25 cents	

#### LIST OF TELEGRAPH STATIONS IN CUBA.

Batabano, Bejucal, Bemba, Bocu de Sagua, Bayamo, Consolacion del Sur, Colon, Cardenas, Cienfuegos, Calbarien, Ciego de Avila, Cuba, Guanajay, Guines, Guaimaro, Jiguani,	Los Palacios, Las Tunas, Matanzas, Pinar del Rio, Paso Real, Puerto Principe, Remedios, San Cristobal, San Antonio, Santo Domingo (Colonade), Sagua, Santi Spiritu, Trinidad, Union de Reyes, Villaciara.
---	---

N. B.—Dispatches to points in Cuba, beyond Havana, are required by the Spanish Government to be written in the Spanish language. No responsibility will be taken on such messages if forwarded in any other language.

#### RULES FOR CHECKING, COUNTING, ETC.

**RULE 1.—Checks.**—The check must comprise:

- 1st. The number of words in the body of the message.
  - 2d. The total number of words including date, address and signature.
  - 3d. The amount of tariff.
- In telegrams from Cuba, destined for Europe, the word Cuba must be added to the check.

#### RULE 2.—Counting.

Each word will be counted as a single word without reference to the number of letters it contains.

The date, address and signature must be counted and charged for.

The name of the place where the message originates, the month, day of the month, address and signature, must be included in every message to protect the several companies interested in its delivery. Should it be desired to send a message in which any of the above requirements are omitted, the sender must write below the message "Responsibility of Delivery Waived," and sign the same name or names as in the signature of the dispatch. The prefix 'R' must precede the check upon such messages.

All compound names and words count for as many words as they contain.

Figures and punctuation marks count each as one word.

**RULE 3.—Official Messages** of the Spanish or United States Governments will be charged less than the above rates by \$3.50 for each message of 20 words or less, and eighteen (18) cents for each additional word. All such messages must be signed officially and the prefix 'G' must precede the check.

**RULE 4.—Code, Cypher and Abbreviations** are disallowed by the Spanish Government.

**RULE 5.—Postage.**—Messages to be mailed to West Indian and Gulf Ports and South America require prepayment of postage, twenty (20) cents in gold.

#### ACCOUNTS.

Atlantic Cable and Cuba Business will not be included in the regular Monthly Account Current or Check Report. Keep an entirely distinct and separate record thereof, and at the end of each month forward promptly to the Auditor, New York, by express, the following:

#### ATLANTIC CABLE BUSINESS.

- 1st. A detailed statement of Sent Business, showing date, address and signature of each message, number of chargeable words and amount collected.
- 2d. A detailed statement of Received Business, giving same data, omitting amount.
- 3d. The originals of all messages sent and copies of all messages received.

#### CUBA BUSINESS.

- 1st. A detailed statement of Sent Business, showing date, address and signature of each message, total number of words, number of body words and amount collected.
- 2d. A detailed statement of Received Business, giving same data, omitting amount.
- 3d. The originals of all messages sent and copies of all messages received.

#### REMITTANCES.

Remit weekly, by express, to the Treasurer, New York, the entire amount of gold collected, with written statement giving date, name of your office, and amount for each day upon Atlantic Cable Business and upon Cuba Cable Business, separately.

WILLIAM ORTON,  
President.

# TERRIBLE TELEGRAMS.

I am of opinion that some place of residence should be provided for quiet, old-fashioned people who find it impossible to accustom themselves to the rapid and to them most obnoxious changes (misnamed "improvements") which are supposed to be essential to what is called progress. Cannot the Government set apart a suburb for our especial benefit; a place to which no local railway has yet penetrated? I don't know one in which, directly a few select inhabitants take quiet possession in the hope of remaining undisturbed by the restless, soulless, mechanical activity of the age, a speculative builder does not run up hideous streets of semi-detached villas, and form a colony of stockbrokers' clerks and aspiring tradespeople, who leave their shops behind daily at five o'clock. The consequence is, that to take these people to town every morning there is an omnibus competition which entirely excludes the original residents from all the inside seats; and, finally, a branch railway and a wretched, horribly new stone-and-stucco station disfigures the place; the best walks are cut up and spoiled; the streets are infested with hordes of navigators, who demoralise the laboring population and increase the number of the beer shops, and we are all scared by day and kept sleepless by night by the scream and rattle of the trains. The whole scandalous proceeding is consummated by the arrival of a telegraphic apparatus and the newspapers; nasty, closely printed, unwieldy, great broad-sheets, from which, if anybody ventures to read them—and it is what I could never bring my mind to do—the ink all comes off upon one's fingers and soils one's muslin dress. It is to the telegrams that I personally have the greatest aversion, however; not that there is any objection whatever to the curious discovery of the powers of electricity. The wonders of science, as exhibited at the Polytechnic, where I make a point of going twice a year, have ever been a source of gratification to me; and I would have them made useful in the instruction of youth at half-price; but nothing now is too high or too sacred for trade; or, as those who are ashamed to call it by its right name say, "for the advancement of commercial interests." Of all the modern inventions which have served to overthrow sentiment among us, to abolish refinement, and to use the results of a high material civilization for the purpose of establishing a mental and spiritual barbarism, I regard the Electric Telegraph as the worst. Telegrams (the very word is, I am told, a barbarous and illiterate jargon) are illustrative of what is called modern progress—of the progress which leaves everything best worth having behind, and for the sake of living faster, enjoys nothing. If they have not almost abolished writing, they have at least nearly put an end to epistolary correspondence. We get no letters now; only brief, uninteresting, and frequently ungrammatical communications, scrawled illegibly on a tiny scrap of flimsy tissue note-paper. Whoever receives a good, honest, earnest letter now-a-days?—a letter which the writer has sat down to as a labor of love, and warming with the task, has extended over a fair sheet of gilt edged post, and then crossed? In a few more years there will be nobody left who keeps packets of letters tied up with ribbon in secret nooks and drawers of their desks and bureaux. There will be no desks and bureaux, perhaps; no letters certainly; it will all be done by telegram, and an invitation will be sent an hour before dinner-time, with just "4.30 sharp" upon it; and the reply will be, "Yes, thanks." This, however, is sarcasm. It ill becomes me to satirize that which should rather be regarded with serious grief; for consider how much letters have had to do with the lives of people like myself: how almost every epoch in our quiet existence has been marked by epistolary correspondence. I never received but two of those dreadful telegrams in my

life, and one of them was delivered to me in mistake for somebody else. It contained only these words: "All right. A girl. Both doing well."

It gave me a dreadful shock, for I remembered how the advent of a little stranger in our family had always been accompanied by a series of observances which indicated that an immortal being had been ushered into the world. There was first a white kid glove on the knocker, then a cushion stuck with pins of welcome, next the solemn whispering reception of visitors by the young mother, who sat up in a lace cap and a large white shawl; and of half-crowns by the nurse, who assiduously produced light refreshments on the occasion; then there was the christening, with white favors and a quiet party; and a silver mug, a papboat, a coral and bells from god-fathers and godmothers. All these ceremonies were the occasion of letters which kept alive family affection, and made life something more than a mere passing reminder, and time worth a better record than the mere memorandum of a railway clerk.

Letters were a part of the observances of society in those days. There were proper seasons and occasions for them, quite independent of anything happening which required to be communicated—at Christmas-tide especially, and on New Years' Day, and birthdays, and on hearing incidentally of some piece of good fortune or any sorrow which had overtaken a friend. I hope we have not yet reached such a pitch of brutality that we could communicate by telegram on any of these occasions, giving our secret thoughts and tender sympathies to the ear of the clerk, and sending them briefly in a couple of lines. I remember even in my school-days how much letters had to do with our daily life. There were the letters that we got from home with the cake and the parcel of fruit, the new writing-desk and the box of toys. Then there were the holiday letters, written just before the breaking up days, wherein we were supposed to write the sentiments of our hearts by beginning "My dear Parents," and declaring our hope that we should "ever be mindful of the constant love and care" bestowed upon us by our dear friends, and "of the inestimable advantages to be derived from the pursuit of those studies to which we were directed by those to whom the care of our education was intrusted." How well I remember the old formula! I have some of my own letters in my desk now, along with those others—those mournful, deep-black-bordered ones that came to me with the first great sorrow that almost laid my life low; but which, coming as messengers of terrible intelligence, had yet something of healing in their wings, because of the love and compassion that dwelt in the words by which that awful message was conveyed. The ink is all brown and faded now, but the remembrance of the sorrow lives, the remembrance of the sorrow and of the tenderness, both of which can be recalled, as it were, in their first freshness by a glance at those blurred and paling characters.

I don't know why I should have grown so garrulous, even though I have lived to be an old maid. Yes, I have one of those other letters in my secretary—letters that tell of the heart's devotion, and of which some of my friends have received so many, and have allowed me to participate in their joy, not always lasting. I might have had, but it was not to be. There came to me one day a black-bordered messenger instead of a white-winged dove, and the page that might have been opened in my book of life was closed forever. I will not think of that now; not that the thought gives me pain. But I have gone quite away from the subject of telegrams. I said I had only received two. The second was from my dear niece Bertha. Her parents live in the country, and I have ever tried to act to her as though she had been my own daughter. She is a fiery, imperious creature, for she was a spoiled child always, and very, very beautiful, I think. So William

thought; for she no sooner left school than he wanted to marry her, and married they were before she was twenty years old. I thought it would have been better for her to have had some household or domestic training first; but that, it appears, has gone out of fashion too. At all events, as her future husband had a good business in the City, they obtained her parents' consent; and my only fear was that her passionate temper might be a trouble to her. Fortunately William was one of the best of men—slow, but with an amiability that nothing could ruffle, and a fine constitution. They were a handsome couple, and I gave them all my old silver tea-service, and the best spoons, for a wedding present.

They have been married now very little above six months, and I have more than once had occasion to warn Bertha not to give way to her temper, or to try her husband's affection too far. Judge, then, of my surprise, my almost horror, when, the day before yesterday, I received a "telegram" from Bertha, saying no more than—"Dear Aunt, come to me at once; I am so miserable."

You might have knocked me down with a feather; but I sent Hannah for a fly—she brought a cab, and it was full of muddy straw, and somebody had been smoking tobacco inside it—and drove off to Barbarossa-villas at once. What could have happened? When I got in Bertha flew into my arms and became hysterical.

"What—what is the matter, child?" I exclaimed. "Nothing between you and William, I solemnly hope and trust?"

"I—I was very wicked, and behaved so badly to him this morning; and I deserve it all, and I am a wretch. But oh! how could he be so cruel?" she sobbed.

"Why, what has he done?" said I, in dismay.

"He went away without a word, or, at all events, I didn't listen, for I went into my own room, and banged the door; but look—look there!"

I saw what it was—a telegram. Oh, how I loathed the sight of the wretched scrap of blue paper, with its red letters! This was it:

"It is too heavy for me. I can not come; but it will be brought home to you, and you will have to pay for it."

What was to be done? I tried to cheer her; told her to hope for the best; that he had sent that hateful message in the heat of passion, which would have subsided over the rational employment of writing a letter. It was with difficulty that I could get her to take a cup of tea. Wearily the hours went on—eight, nine, ten, eleven, midnight—and she sat there dumb, weeping, almost heart-broken.

Suddenly there was the sound of a key in the lock of the street-door, a foot upon the stair, and her husband burst into the room. He looked with surprised inquiring glances from one of us to the other. With a great cry Bertha sprang into his arms, her face upon his shoulder.

"So you have forgiven me, dear William! you have come back!" she said, in broken accents.

"Come back!" he replied; "of course I have. What ever is the matter, my love?—you got my message, didn't you?—and the turkey's in the passage, see. You've paid for it, haven't you?"

"Paid for it!—oh, William! Yes! no—what do you mean?"

"Please, ma'am," said the servant-girl, who came in at that moment, "I wished to tell you as the man that have brought the turkey he's my fust-cousin, and I asked him to step into the kitchen, ma'am, till such times as you was recovered sufficient for to pay for it."

"I'll go and see to it," said I, and went out of the room, leaving the young couple together.

COMPLETED.—The Burlington and Missouri River Railroad Telegraph line, between Burlington and Osceola, Ia.

## MONTHLY CIRCULAR.

EXECUTIVE OFFICE.  
 WESTERN UNION TELEGRAPH COMPANY,  
 145 Broadway, New York.  
 February 15, 1888.

To ALL OFFICES ON W. U. LINES:

The following changes were made from the 1st to the 15th of February:

## CENTRAL DIVISION.

The offices on the *Philadelphia and Erie Railroad*, in Pennsylvania, will, on and after the 30th instant, be checked direct, and in other respects treated as offices on "This Line."

To obtain the rate to the following named points:

Sheffield, Kane, Wilcox, Johnsonburg, Ridgeway, Shawmut, St. Mary's, Rathbun, Emporium,  
 All offices on the line between and west of Binghamton and Syracuse, in the State of New York, and all in the Central Division west of Pittsburg, Pa., will add 25 and 2 to their present rate to *Corry, Pa.*  
 All other offices in the Eastern Division, and those in the Central Division east of Pittsburg, Pa., will add 40 and 4 to their present rate to *Lock Haven, Pa.*  
 Offices in the Southern Division will compound by way of Washington at 155 and 18, or by Louisville at 160 and 12.

Cameron, Sterling, Keating, Driftwood, Renovo, North Point, Welham,  
 All offices on the line between and west of Binghamton and Syracuse, in the State of New York, and all in the Central Division west of Pittsburg, Pa., will add 40 and 4 to their present rate to *Corry, Pa.*  
 All other offices in the Eastern Division, and those in the Central Division east of Pittsburg, Pa., will add 25 and 2 to their present rate to *Lock Haven, Pa.*  
 Offices in the Southern Division will compound by way of Washington at 200 and 14, or by Louisville at 175 and 18.

Farrandsville, tariff same as Lock Haven, Pa.  
 Garland and Waterford, tariff same as Corry, Pa.  
 Corry and Lock Haven, tariff unchanged.

## EASTERN DIVISION.

NEW OFFICES OPENED ON W. U. LINES.

East Dorset, Vt., tariff same as Manchester, Vt.

OFFICES CLOSED ON "OTHER LINES."

## Tariff from:

	Lock Haven & Harrisburg.	Pittsburg.	Philadelphia.
Beech Creek, Clinton Co., Pennsylvania,	40 & 8	45 & 8	60 & 4

## PUBLISHED BY

W. A. TOWNSEND & ADAMS,  
 434 Broome Street, New York.

## JOURNAL OF THE TELEGRAPH.

Published on the first and fifteenth of each month, commencing with December 2, 1867, will be what its name indicates, a record of Telegraphic progress throughout the world.

Although issued from the executive rooms of the Western Union Telegraph Company, and liberally patronized by that Company, the discussion of all subjects of interest to the Telegraphic world will be left free in the Editor's hands, and treated upon their merits as these may commend themselves to him.

By the aid of a liberal supply of periodicals having to do with electrical science, and coming from different parts of the world, a valuable gleanings of matter interesting to all owning or using, or working or managing Telegraph Lines will be provided. In this the Journal will be much aided by correspondence from experts both at home and abroad, who will keep it fully posted on electric subjects.

Having adopted the use of

**OREIDE METAL,**

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed. His Relays were awarded

**THE FIRST PREMIUM**

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them. Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

**BUNNELL'S REPEATERS,**

lately patented, and now pronounced the simplest and best extant, furnished in splendid style.

# JOURNAL OF THE TELEGRAPH.

NO. 7.

NEW YORK, MARCH 2, 1868.

VOL. I.

NOTE.—We are indebted to S. R. Wells, Esq., Editor of the *N. Y. Phrenological Journal*, for the admirable likeness of Peter Cooper which adorns this page.

## PETER COOPER.

PRESIDENT OF THE NEW YORK, NEWFOUNDLAND AND LONDON TELEGRAPH COMPANY.

From the *N. Y. Phrenological Journal*.

Mr. Cooper has naturally a strong and vigorous constitution, and exhibits qualities of endurance both in his physical and mental organization. The motive temperament is well indicated by the strong frame and large muscles; and the mental temperament also is well manifested by the size of the brain and the general fineness of the constitutional texture. A careful and abstemious life has developed a naturally good organization, and now, at the advanced age of seventy-seven, he enjoys vigorous health, and is able to attend to the administration of a large estate and of a prosperous business. Perseverance and determination are among the most prominent qualities of his character. Whatever he determines to do, he follows earnestly and perseveringly to the end. He is not aside from any object which he entertains. There are also the indications of a strong moral sense, and the appreciation of those responsibilities which devolve upon him as a member of society. Inclined to be cautious—disposed to avoid public prominence—and to adopt those measures only which commend themselves for their honesty, integrity and safety, he is not by any means rash, headlong, or careless. He is a practical man in the main, appreciative of the actual—the tangible. He takes into account all the details of whatever subject claims his attention, and is seldom mistaken in his impressions of things.

He has a warm, social nature. Is cordial in his friendships; appreciative of the pleasures and ties of home, and usually retains those whose affection or regard he has acquired.

### BIOGRAPHY.

This eminent New York philanthropist was born on the 12th day of February, 1791. His father was a lieutenant in the Revolutionary army during the war for independence. The business of his father was that of a hat manufacturer; and in early youth Peter was employed in the business, and labored assiduously until he had attained the age of seventeen, when he was apprenticed to Mr. Joseph Wardwell, a coach-maker. In a few years he became skilled in this trade, and at the expiration of his apprenticeship, continued working as a journeyman until the opening of the war of 1812, when he abandoned coach-making for the manufacturing of machines for shearing cloth.

This last business he carried on successfully to the close of the war, and then entered into the manufacture of cabinet ware, which he subsequently quit, and opened a grocery store. This business, however, he found to be rather out of his line, and he soon returned again to manufacturing. The department which now interested him was that of the pre-

paration of glue and isinglass for the market, a business which he carries on at the present time.

He became interested, while yet a young man, in the development of the American iron interest. In 1830, he established extensive iron works near Baltimore; and afterward started a rolling and wire mill in the city of New York, where he made the first successful attempt at the adaptation of anthracite coal to puddling iron.

This mill was afterward removed to Trenton, New Jersey, where it was from time to time enlarged, until it became the most extensive rolling mill in the United States. Vast quantities of railroad iron and wire have been turned out of this manufactory.

At present, the business of this establishment is in

the hands of a company, of which he is a prominent manager. The best locomotive in general use on this continent was built by Mr. Cooper, at Baltimore, after his own designs, and worked on the Baltimore and Ohio Railroad.

He was warmly interested in the electric telegraph from its earliest conception; and invested liberally in enterprises having in view its establishment.

He has also been associated with the city government of New York, and won a prominent position by his earnest efforts to promote the welfare of the community.

He has made his name particularly famous, however, through his many large charities. The cause of education has ever found him a warm advocate. His sympathy in this matter finally culminated in the erection of a splendid building in the central part of this city, at great cost, and devoting it to the free education of the working classes. His designs in this respect have been carried out, and thousands of worthy but needy youths have been educated in the higher branches of knowledge in the COOPER INSTITUTE. In connection with this, Mr. Cooper has established a large and neatly appointed reading-room, which contains a large and valuable collection of books and the current periodical literature of the day.

## Correspondence.

DRESDEN, SAXONY, Jan. 24, 1868.

MY DEAR FRIEND REID—I recognized with gratification this morning, in the letters handed me, your beautiful copper-plate chirography, in one of the date of January 2, and I reply without delay to say that I will attend to your requests with great pleasure. I shall probably visit Berlin before my return to Paris, and while in Berlin will find for you the German work you desire, or procure it in case I do not go there. And when in Paris again, will procure you the French words on your list. I have in my collection both *du Moncel* and *Gannet. Blavier* and *Breguet* should be added. All these writers, so far as historic narrative is concerned, require more or less correction; especially *du Moncel*, who (*entre nous*) like some previous writers, French and English, and a few German, have given undue prominence to Wheatstone; for not content with applauding him for scientific researches and discoveries, for which he deserves credit, but which in many instances have little to do with the Telegraph, there is a constant and unwarrantable attempt to produce antagonism and rivalry between him and myself, which is not only unjust to both of us, but in a special manner to me. I have no other desire than to do strict justice to all laborers in the beautiful and expanded domain of the telegraphic field. There is in fact no conflict between Prof. Wheatstone and myself, for our systems are totally different, as I hope ere long to make perfectly clear. I am engaged in a work specially designed to correct some of the stereotyped errors that have either ignorantly or wilfully been disseminated in the histories of the telegraph. It is but lately that I have had my attention directed to them. These

histories are full of them, and I have found it difficult to determine which ones demand my immediate and detailed exposure, and which may be left to the slower effect of facts and truths which cannot fail eventually to correct the Records.

At the same time that I received your letter, I also received a copy of the first number of your JOURNAL OF THE TELEGRAPH, the editorship of which could not be in better hands. It is an enterprise deserving of extensive patronage, and I cordially wish it success. Place my name as a subscriber on your list. In perusing the first number, however, you will allow me to criticize it freely. On the third page Hughes' improvement is noticed, and its adoption in Turkey. It well deserves all the praise that has been bestowed upon it for its consummate ingenuity. No one appreciates and admires it more than myself. But should it not be recognized that it is the fruit of the original Morse telegraph, which first realized *writing or printing* at a distance? It should also be known that it is not a *substitute* for Morse's, but an *adjunct*, so styled by the accomplished and profound director of the Russian telegraphs, who, while charmed with the Hughes instrument, said: "The two must go together; the Morse must always be at hand by the side of the Hughes, to be ready, with its simplicity and certainty, in the fre-

quent interruptions occasioned by the derangement of the latter."

On page 5 is Mr. Varley's letter, which struck me with no small surprise. From what I know of Mr. Varley, whose genius and acquirements command the highest respect, and whose disposition, I am persuaded, is to do strict justice, I have no doubt he will be pleased to be corrected in his statement of the origin of the code or telegraphic alphabet in universal use. Mr. Varley says: "*This alphabet was originated by the Germans!*" and he then gives the philosophy of its construction, as if this was their work. It is scarcely necessary for me to say to those familiar with the history of the telegraph in the United States, that this code, which has been adopted throughout the world, originated with Mr. Morse, and, indeed, is distinctly recognized on the European continent as the MORSE CODE. It is an essential part of the *Morse apparatus*, which is formally adopted for all the international lines, by the great International Telegraph Convention of 1865. Morse constructed this code on the very principles which Mr. Varley sets forth and erroneously ascribes to the Germans. This code is specified and illustrated in detail in Morse's first patents, many years before there was a recording telegraph practically established in Europe; consequently, before any such code was required there. Mr. Varley further says: "This system has been brought by cable across the Atlantic Ocean to North America." He seems not to have been aware that its first voyage across the Atlantic Ocean was not from Europe, but to Europe from America, some twenty-eight years before any cable was ready to use it.

In regard to this code, let me say that at the same time that I am preparing the "corrections of dates and events, etc.," I have also nearly ready to transmit to Congress a report on the telegraphic apparatus in the Exposition, to which duty of reporting I was assigned by the Board of Commissioners, as a Commissioner of the United States. In this report there is a chapter under the head of *Codes*, in which the subject is briefly discussed, and which I would transcribe but for want of time. On this code, however, I may say that Mr. Varley may have been led to believe that it was constructed in Germany because some modifications have been there made in it. The original Morse code contained five letters which, from their liability to be mistaken for others, required modification; these have been modified in the present code, and are improvements. Some five or six others have been changed, by transferring the combination forming them to other letters, but these changes are of doubtful advantage. The rest of the letters of the code are precisely as Morse originally conceived and devised them.

On page 6 you perpetrate one of the stereotyped errors of which I have spoken. The error is not in the fact, but, from its position, the *inference* is an error. The natural inference is that the model thus shown on Sept. 4, 1837, was the *first* exhibition of the telegraph; and it is stated in many publications that this is the actual date of the invention. Nothing can be further from the truth. This very model was first shown in operation in *November, 1835*. The exhibition in September, 1837, was a more public one, and the announcement in the newspapers of the day; while the first exhibition, not so public, was not noticed in the journals, has doubtless caused the error that this last was the date of the invention. The first exhibition of a telegraph instrument was November, 1835. I wish I could enlarge. I close abruptly to save the mail.

Truly your friend and servant,  
J. D. Reid, Esq. SAMUEL F. B. MORSE.

We are glad to see the face of Richard Stevens again in his old haunts. He now prospers in California, and is in New York on furlough. Long life and success to him.

#### How to Find Crosses.

NASHVILLE, TENN., Feb. 15, 1868.

MR. EDITOR—You, in common with all well-informed practical Telegraphers who have given their business due attention, have no doubt suffered much vexation of spirit from the lack of knowledge of elementary principles and plain practical facts on the part of operators in small offices. Many of these are skillful manipulators, yet their ignorance is coupled with a false pride which resents instructions sadly needed. Many of these sensitive experts, and many others who are neither sensitive nor expert, may receive a few simple suggestions through your columns without offensive personality.

With this view, and upon the presumption that all operators, in common with the writer, are in need of instruction of this character, either on their own account or that of their co-laborers, I propose in this communication to point out the simplest and best mode of locating a "cross" on two or more wires, for I believe this to be one of the greatest annoyances Telegraphers have to contend with, and our daily experience teaches us that the manner of locating them is less understood than almost any other trouble that occurs in our daily duties.

If this should seem too simple a matter for publication in the JOURNAL, I will mention the suggestive fact, that only three out of twenty-three operators in a certain city office, can locate a "cross," or an ordinary ground escape.

The following diagram will fully explain to those who do not already know the best and simplest mode of locating a "cross." We will take lines No. 1 and 2 from A to B.

A discovers No. 1 and 2 crossed north, south, east or west, as the case may be. A tells B to open No. 1 and makes dots on No. 2. A will immediately open No. 2 and adjust on No. 1 for B's dots; if he hears B on No. 1, then the "cross" is located between them. If A gets no dots from B on No. 1, then it is evident that the "cross" is beyond. A will keep No. 1 or 2 open, and call the next office beyond B and test as before, and so with every office in the circuit until the trouble is located. The same rule of testing will apply to any number of mixed wires.

Before closing, I would advise all who have not already done so, to send to Ticknor & Fields, Boston, and procure a copy of Geo. B. Prescott's (late edition) "History, Theory and Practice of the Electric Telegraph," price \$2 50. To the practical Telegrapher, it is certainly the best work upon the subject that has yet made its appearance.

Yours truly,  
CROSS.

#### An Improved Telegraph Key.

We are permitted to publish the following letter to Mr. Tree, and having seen the Key, to which allusion is made, feel very glad that the article of our esteemed correspondent "T," of Philadelphia, has met so ready a response. We shall give a description of the new Key whenever Mr. Benton gives us his consent to do so. We may say this much now. Mr. Benton's Key has no trunnions. The upper and lower bar and spring is a unit, and a guide prevents all oscillation except the legitimate movement in manipulating. The Circuit-Closer is not automatic, but arranged like a Railroad switch, to attract attention to its condition. When closed the contact is complete:

MACON, GA., FEB. 15, 1868.

J. B. Tree, Esq., 145 Broadway, New-York.  
Presuming on your well known kindness to your

Operators, while Superintendent of the South Telegraph Co., I venture to address you, asking you kind consideration of my effort.

Acting on a suggestion of the JOURNAL OF THE TELEGRAPH, in an article headed "Telegraph Keys," I have made a Key, which, as near as I can see, corrects all the faults complained of in the article, and I send it to you, well knowing if there is any merit or originality in it you will credit it with it, and also be kind enough to point out its defects. Very respectfully yours, &c.,

WM. A. BENTON,  
Asst. Opr. Macon, Ga. Office.

#### Still Another—A Self-Closing Key.

To the Editor of the Journal of the Telegraph:

SIR,—Having noticed in the columns of your journal two letters from correspondent "T," Philadelphia, on the subject of "Self circuit closing telegraph Keys," I take the liberty to reply to him through the JOURNAL. I have a self circuit closing key, of my own invention, in use, which has the same movement or motion of the present Morse lever key, but different in construction. It is without trunnions. The connections are sure. The manipulation is easily accomplished, without any inconvenience to the manipulator from the *self-closer*. Altogether I think it obviates all the objections referred to by correspondent "T."

WARREN, Mass., Feb. 21, 1868.

To the Editor of the Journal of the Telegraph:

What a history have we operators, commencing in those days of delicious ignorance when we were first instructed in the rudiments of the glorious Art.

With what a mysterious air would we open the local circuit (when our instructor was out) and inwardly congratulate ourselves on the terrible discovery we were making, *without opening on the main line*, or still further on when we were learning to write, would open the circuit and writing "134"—"who is at the key?"—wonder why somebody didn't reply at once, and repeat their whole history from childhood up.

How I pitied that poor man, and what a lucid (!) explanation I gave him of the whole Art.

Telegraphing is not so pleasant now-a-days, for we are at a repeating-office, and every few minutes one or all of our instruments are ringing with our "call," and then with the slight variation of "three" or "city" we plod on from morning till night.

It is not altogether monotonous, however, for now and then we have pleasant chats with our friends far away, or sometimes after business hours at night indulge in a game of chess with some champion over the wire.

You do not hear often from our District, I fancy. Well, we (the employees) are the best contented possible, have a kind and efficient Superintendent, Mr. Jas. Compton, whom we take a pride in pleasing.

Of course we are laboring under the common annoyance of "Sunday Labor," but there is a petition going around which when completed and presented we hope will be favorably considered, for Telegraphers generally desire and need the rest afforded by the Sabbath as much as members of other professions, who are not confined by Sunday rules.

Having no suggestion to offer, telegraphically, I close, wishing the JOURNAL all possible success.

CANTON, MISS., 5th Dist. W. U. L.

NOTE—Nothing gives us so much pleasure as the evidence of mutual esteem between Superintendent and assistants. If James Compton is what he was, cheerful, frank and generous, his operators will respect and love him. In any reduction of Sunday labor, and in its extinction wherever possible, "D" may count on our aid. We were the first in America to oppose it, and we have not changed.—Ed.

## Insurance.

To the Editor of the Journal of the Telegraph:

It may seem unnecessary that anything more be said in reference to the Telegrapher's Insurance Association, but I find there are so many outside of New-York that still seem to be in the dark respecting its plan and scope that a few lines by way of explanation may not be amiss.

The necessity of some kind of benevolent association among Telegraphers had long been felt, but it was exceedingly difficult to devise anything that would accomplish all that was desired. The Union had scarcely answered the requirements demanded of it—even its most sanguine friends did not claim as much—hence, when the suggestion was made, (and here let me say no hostility to the Union inspired it,) to form an Insurance Association, it met with great favor, and was at once carried into effect. The plan adopted was very simple. Each member was to pay one dollar to the family of any who might die. This was all. Expenses were not to be permitted, except such as were absolutely unavoidable for stationary and printing, and these were provided for by a small fee paid in at the time of joining. The officers were to serve without remuneration, and the whole amount of moneys paid in were to go to the fund, undiscounted. Now this association is in full and successful operation, some 225 persons, from all ranks in the business, have availed themselves of its provisions, and paid in their entrance money; but in order to make it sufficiently effective, at least five hundred ought to take out certificates or policies, then we would have a cash fund of \$500 always on hand to pay over in the event of a death. This amount will no doubt be obtained in a few months, but a growth of five or six a week, which may be taken as an average, is rather slow, when we think of the thousands engaged in the business. One object in my writing this communication is to make an appeal to the operators and others, to join hands with us in this good work. None will deny the wisdom of making provision against the day when death shall deprive beloved ones of the means of support, but they procrastinate. To such, I would urge immediate action, because their aid is needed to make this organization a success. We want them to join hands with us in aiding the desolate, and in our mission of kindness to the bereaved. Are we wanting in affection for our households? Shall we expose them to the degradation of a subscription paper? Then why delay in doing what we can so easily do to mitigate their woe, when the staff upon which they have leaned is broken, and they are left to struggle, unaided, with an unfeeling world.

The Executive Committee have deemed it wise to restrict the membership to certain geographical limits, but any effort to extend the membership in any but the extreme Southern States will be gladly encouraged. The advertisement of the association will be found in this paper, giving direction for making application.

D.

Apropos of the foregoing we subjoin a few words from an intelligent friend in Trenton:

TRENTON, N. J., Feb. 14, 1868.

D. R. Downer, Esq.,

DEAR SIR,—I herewith enclose you my name, with Charles McLaughlin's, for membership of the Telegrapher's Mutual Life Association, also the amount required for membership. I had hoped to have been able to send several names, having received the assurance from several that they would join the association, but men appear dilatory in such matters, while the bloom of health prevails. A brother Odd Fellow died and was buried last Sunday who had been exhorted to join the Funeral Aid Association, which has been formed in this County by the different Lodges, and I am indeed sorry he did not take the warning voice of his best friends.

He left a young widow with four small children to the cold charities of the world, which he might have provided for comfortably. But such will be the case with many of our young Telegraph friends, notwithstanding the timely warning you give them through that excellent medium, the JOURNAL OF THE TELEGRAPH. You can please mail my certificate, with McLaughlin's, should you deem us worthy of membership, to me, and oblige.

Very truly yours,

JOHN A. WRIGHT.

## A Philadelphia Invention Successful in France.

The following, which is a translation, in substance from an article in the Paris *La Senarne Financiere*, of January 25th, will show that an invention of one of our own citizens, designed to perfect the insulation of electric telegraph lines, has been declared superior to all its competitors by a French Commission, which had before it insulators from nearly every State in Europe:

"*Electric Telegraphing*.—M. de Vougy, the Director General of Telegraphs, who is anxiously engaged in improving our telegraphic material, some time ago named a commission, specially charged with examining the various kinds of superior insulators, with the view of the adaptation of the best of these to the French telegraphs. This commission, furnished with instruments of great delicacy, for the purpose of measuring the amount of waste (or leakage of electricity) from these insulators, has established the great superiority of the insulators of Mr. David Brooks, of Philadelphia, over all other competitors, and has ordered a considerable quantity of them, in order to make an extensive trial of them throughout our telegraphic lines."

The Brooks insulator is composed of an iron hook, intended to hold the telegraph wire. This hook is cemented in a glass vase, of elongated form, contracted at the neck. The glass itself is cemented in a hollow-cast cylinder, and all parts of the apparatus, which are susceptible of absorbing paraffine, are saturated with it. The glass vase has also very decided qualities of repelling moisture, and contributes to render the insulator perfect. It is to the employment of paraffine, now known as the first of insulating bodies, that Mr. Brooks owes the success that he has obtained.

The French Government has sent to Mr. Brooks a beautiful and sensitively delicate differential galvanometer, (made by Ruhmkorff,) of 40,000 involutions, to test the insulators he is making for the French telegraph, and specimens of all the insulators from every part of Europe offered in competition before the French Commission.

SELF-BREAKING TELEGRAPH REPEATER.—J. H. Bunnell, N. Y. City.—This invention proposes to furnish an improved form of self-breaking telegraph repeaters, by which the operator is enabled to do away with extra local batteries, heretofore generally used in all practical forms of self-breaking repeaters, and by so doing away with extra local batteries and the many necessary connections resulting from their use, to greatly simplify the general adjustment and operation of the complete instrument.

## Distances at which different Sounds are Audible.

	Feet.	Miles.
A full human voice speaking in the open air, calm,	460	.065
In an observable breeze, a powerful human voice, with the wind, can be heard,	15,840	3.
Report of a Musket	16,000	3.02
Drum	10,560	2.
Music, strong brass band	14,840	3.
Cannonading, very heavy	575,000	90.

In the Arctic, conversation has been maintained over water a distance of 6,696 feet.

## Miscellany.

A GERMAN telegraph operator received information, last month, that he was one of the heirs of an East India millionaire recently deceased; whereupon he borrowed large sums of money, took his family to Vienna to live, and threw his thalers about in princely style. But in the height of his enjoyment the information came that it was all a mistake, and that he had no claim upon the inheritance. Maddened by the sudden overthrow of his hopes, the morning after the receipt of the fatal intelligence he strangled and shot his wife, beat out the brains of his infant, shot his two elder children, and emptied the last charge of his pistol into his own brain.

OUR old friend A. L. Whipple, of Albany, has been appointed Superintendent of the Fire Alarm Telegraph of that city. A very sensible appointment.

CYRUS W. FIELD, Esq., sailed for England on the *Java* which left New-York Feb. 19th. His two daughters accompanied him. Mr. Field goes to endeavor to induce the consummation of the arrangement between the old Atlantic Cable Co. and the Anglo-American Telegraph Co., of which we gave full details in the JOURNAL of Feb. 1.

MR. SAMUEL GARDINER has just placed his electro gas-lighting apparatus in the picture gallery of A. T. Stewart, Esq., it being a part of the magnificent mansion which he is soon to occupy on the Fifth avenue. The number of burners is 325. The room was instantaneously lighted on the evening of the 19th inst., and was decided by Mr. Stewart, Mr. Kellum, the architect, and others present, to be a perfect success. From the street, the view was magnificent, the reflected light being seen at the distance of several blocks. On turning the gas off and on, the effect was like that of repeated flashes of lightning. In the Gardiner machine each burner is lighted by means of a platinum wire, made red-hot by means of an electric current.

THE Portuguese Government has given Mr. Medlicott, a Lisbon merchant, and Mr. Rumball, of London, the right to form a Company which shall lay down a line from Falmouth, in England, to Oporto; thence to the Azores, and from thence across to the West Indies or to some part of this continent. The estimated cost of this proposed Portuguese line is £800,000.

## House of Representatives.

FEBRUARY 14.—Mr. Myers, from the Committee on Patents, reported a bill authorizing the Commissioner of Patents to receive and entertain a renewed application of Charles Grafton Page, of Washington, for letters Patent for his induction apparatus and circuit breakers, known as the "Induction Coil," and if he be found the first inventor thereof, to issue a patent, reserving the right of persons now owning and using such apparatus.

After explanation by Mr. Myers, and the reading of the report, from which it appeared that the induction coil of Ruhmkorff, for which he was in 1864 awarded the French Imperial prize of 50,000 francs, was substantially the invention of Mr. Page, and was exhibited by him in 1839 and 1840, but not patented, because he was in the employment of the government.

The bill was passed.

Proof is being afforded by recent publications that to Professor Page we are indebted for what has been called the Foncalt circuit breaker, a spark arresting apparatus, which by European savans, is deemed essential to the working of large electro-static coils. We are delighted to see one whom we know to be so worthy, receiving the long delayed honor which his high character and genius deserve.

## Interpreting Telegraph Rules.

There is a law recognized among men and horses that, when passing up and down the pavement or the street in different directions, each takes the right and thus move forward. Some are always stupid enough to be dodging from one side to the other, treading on some man's toes, tearing some woman's dress, and getting kicked and sworn at generally, yet never learning the art of getting through peacefully and unharmed. A great many men have to learn that law is not always order, and that the yieldings and the softenings, and the self-abnegations we have evermore to practice in all life's duties, are the promptings of the highest wisdom and surest auxiliaries to success.

A curious example of the rigid duty men, in quite another sphere from that indicated above, yet as sublimely conscientious, occurred in the dining hall of the Burnett House, Cincinnati, at the time of the opening of that house, many years ago. Servants were needed and scarce. Raw hands had to be taken from the street and taught for the service. These were marshalled round the head steward to receive orders. One of these rules was pithily stated thus: "Soup first; nothing till after soup." One stout fellow caught the order as he would a charge to take an enemy's battery. "Zoop first; nothing till after zoop," he repeated, until he made it very clear to himself that the only way to roast-beef, or pudding, or charlotte russe was via "zoop." Thus primed, the door opened, and the guests, with their smiling faces and new clothes, marched in with gentle step to their seats. Each waiter had five chairs and their occupants to provide for. Our waiter had received four of his, each of whom passively accepted the initiatory rite of spoon victuals, and took their soup like Christian gentlemen. But after awhile came the fifth, a big, boney fellow, who threw himself into the vacant place as a hungry horse would snort into his stall and whinney for his oats. Quick as a flash the conscientious Patrick Malone was by his side with his plate of initiatory soup, and which he essayed to place before the raw-boned.

"Don't want any soup," growled Indiana.

Here was a go. "Zoop first; nothing till after zoop," thought Patrick. That was clear duty, and after a moment's consultation with himself, "zoop first" seemed clearly the higher law, and down again the plate of the timidest vermicelli was descending, when Indiana angrily exclaimed—

"I told you I didn't want soup—take it away and bring a big piece of beef."

Pat was puzzled for a moment—only one. He had been defied in the conscientious discharge of his duty. His indignant blood waxed warm, and when Indiana, with a round prairie oath, turned again on the descending soup, Patrick indignantly ejaculated: "Divil a bit o' mate will yez git to ate till ye ate yer zoop; its aginst the rules ov the house. Zoop first; nothing till after zoop."

In the management of telegraph lines there are necessarily many orders to be given. When these are issued, a reason usually accompanies them or is understood, which, to intelligent men, justifies the issue and secures obedience. Sometimes these are arbitrary, having reference to some fundamental necessity. Thus the strict privacy of messages de-

mands the most uncompromising enforcement. There stubborn virtue is heroic. But of some rules the intelligence of men must form a part, and so conjoin that the rule may remain intact and yet good sense prevail.

Take for example the following scene in a telegraph office, no matter where—say in Sitka—lest any one recognize the facts:

*Mr. Brown*—Can you send a message for me to Coventry?

*Receiving Clerk*—Yes, sir.

*Mr. Brown*—Send it immediately?

*Clerk*—Very soon, sir (said with due caution); takes message, counts words, takes ordinary tariff, times it, numbers it, says good morning to Mr. Brown—and, so far, all is lovely and polite.

Message was one of importance, would produce an answer if received, and an answer of a special kind. It read thus:

Charter none of the vessels named in your letter. Answer at once. JOHN BROWN.

After a reasonable time, answer came:

*John Brown, Sitka:*

Despatch received. Have chartered the Columbus. Will sail next Monday. JAMES SMITH.

*Mr. Brown* was perplexed. Something was clearly wrong. He had ordered *no* vessels to be chartered, and here is the Columbus coming, the very one, likely, he least wanted to see.

*Mr. Brown* put his hat on his head in a very summary manner and made for the telegraph office, arriving at the counter in such a state of wind-brokenness as to seriously interfere with his articulation.

Young man, you there (pointing animatedly to the clerk who had received his message, and who was then busy washing his round young face, before going to supper), I want to see the dispatch I left with you this morning.

*Clerk*—(Gurgling through the soap)—Yes, sir, in a moment.

Gets the message, looks scrutinizingly at Mr. Brown, to be sure he is the very Brown, hands him the message, carefully watching lest it be taken away contrary to rule.

*Mr. Brown*—This is all right, but see the answer I have received. There is an error somewhere, sir. I wish you to see if it went correct.

*Clerk*—We can make no inquiries unless you pay for repeating it. These are our orders.

*Mr. Brown*—(Excited)—You refuse to see if you committed a mistake when I show you that it is certain one has been made? You are willing to cause me loss, and disgrace your company, eh?

*Clerk*—You can send another message and make it all clear, or you can have this repeated by paying for it.

*Mr. Brown*—No, sir; I shall hold the company responsible. I show you that there is an error. You have the chance now before any damages are incurred to correct it. Will you correct it or no?

*Clerk*—Can't do it, sir. Against our rules.

And so Mr. Brown, stubborn and indignant, with a volley of oaths, and in a burning rage, sallies out, engages his passage in the night train for Coventry, arrives in time to prevent loss, and after two nights' travel, an immense loss of temper, and minus a good amount of pocket money, arrives at Sitka.

Now, Mr. Clerk, you are very honest, very; but, under such circumstances, you acted a very unintelligent part. No rule was ever made to injure the company making it. If you could not oblige the man, you should have felt the instinct of preservation to save the company. No rule preventing correction of such a case had any force.

And what caused all this? Simply the omission of a letter by which *none* was rendered *one*. A little sense, a little intelligent politeness would have saved all. Rules are to guard against loss, never to be used to cause or confirm them.

## Official Statement of the Business of the Western Union Telegraph Company.

DECEMBER, 1867.

Receipts,	\$576,135 19
Current Expenses,	379,291 35

Net Profit,	\$196,843 84
-------------	--------------

This shows an excess of \$16,843.84 over the estimated amount shown in the statement of January 1.

The receipts of January and February so far as known approximate those of the same months in 1867.

Charles E. Stewart, Esq., chairman of the board of the Anglo-American Telegraph Company, while presiding at a meeting of the Company in London, Wednesday, Feb. 19, was struck with apoplexy, and died in his chair in the presence of the board.

THE British and Irish Magnetic Telegraph Co. of Liverpool have declared a dividend for the past six months at the rate of 8 per cent per annum, reserving a fund of £22,416.

THE Electric and International Telegraph Co. of London have declared a dividend of 5 per cent for the past half year free of tax.

The ministerial plan for the assumption of the Telegraph lines of Great Britain was to have been made public within a week after the 17th of February, but which we have not yet received.

General T. T. Eckert is engaged in perfecting a new insulator adapted to the existing fixtures of the Eastern lines, but which has claims for much more extended use. We have not room to go into particulars now, but will describe it fully, if permitted, in our next issue.

The business of the Tariff Bureau has been assigned to the Engineers' Department, and all questions or information relating thereto, will be directed to Gen. M. Lefferts, Engineer. This department now comprises the commercial news, tariff, and general statistics, the last of which the company greatly needs, and in the collection and arrangement of which Gen. Lefferts has much skill and a lengthened experience.

The International Ocean Telegraph Company have declared a dividend of 7 per cent, on its preferred stock. All's well, and Gen. W. F. Smith, President.

We are under great obligations to Charles E. Pomeroy, of the Salt Lake office, for the interesting article on frictional electricity developed by winds on the western plains.

MR. A. S. HEWETT, Commissioner to the Paris Exposition, in an elaborate report shows that iron, by the fewer days labor required in preparing it in America, can be made cheaper than in either England, France, or Belgium.

All our readers will recollect the correspondence between Mr. C. K. Jones, of Fort Wayne, and Mr. Varley, the English electrician, respecting a mode of accelerating the speed of transmission by the Atlantic cable. On this and kindred subjects, Mr. Jones was somewhat of a monomaniac. They engrossed his entire being. A few days ago we received the melancholy intelligence that he had been taken to the insane asylum. It is thought that the revelation of the futility of the ideas he had cherished so long, on which he had lived and labored and hoped, took away from him the thread on which his brain-work hung, and left it void and broken. It is a sad case. We love the men with whom we toiled in earlier years. Jones was one of these, earnest, faithful true. It is mournful to think he lives, yet cannot receive the benefit of kind words from lips that would gladly utter them.

**Frictional Electricity Excited by the Air.**

A curious electrical phenomenon occurred several times upon the Overland Telegraph line, of which the following brief description is given:

It has happened three or four times within three years, that a strong, steady northwest wind blew from Fort Laramie, Dakota, to Omaha, Nebraska, a distance of six hundred miles. This current of wind arose during the forenoon, and increasing rapidly toward noon, attained its greatest velocity at 2 P. M., at which time a powerful current of electricity, excited by the friction of the air upon the wire, was observed to flow into the Omaha office, changing the circuit to so great an extent as to entirely suspend communication, and heating the relay magnet to a degree which rendered it necessary to cut it out from the circuit at the thumb screws.

The main battery being thrown out of the circuit, the key was opened, when a large and remarkably vivid spark, of an intensely brilliant purple hue, appeared at the platina points of the key. The point of a penknife blade, which was inserted in the spark, was instantly fused. The spark continued uninterruptedly for several minutes, when, it being feared that the platina points would be destroyed, the key was opened to one quarter of an inch play, notwithstanding which the spark increased proportionably in size and brilliancy, and remained unbroken. A bit of charcoal placed between the points of the key was almost instantly decarbonized and reduced to ashes. A small lump of blue vitriol was then introduced into the spark and was immediately ignited, exhibiting a bluish flame, but being reduced to ashes less quickly than the charcoal; a common lead pencil being interposed was instantaneously ignited and rapidly burned through, with a flame of a reddish tint.

The extraneous current was observed to flow in waves of fifteen minutes duration, leaving the circuit entirely open at the expiration of each wave, and resuming its intensity after a lapse of a few seconds. These intervals were accounted for on the supposition that corresponding lulls of the wind occurred at some point along the line.

Toward dusk, after the intensity of the current had decreased considerably, it was deemed safe to replace the relay in circuit, which being done, the line worked unexceptionably well to Fort Laramie without the aid of a main battery at either end.

This phenomenon is quite different to that of the *aurora borealis*, as the latter is nearly always fitful and irregular in its manifestations, while the former affords a comparatively steady current, by which the line can be readily worked without change of adjustment during the continuance of the wave.

This example of frictional electricity induced by the wind flowing parallel with a long stretch of line has probably never been witnessed elsewhere with the same degree of intensity, as there is no other line on this continent of an equal length which traverses such a level, unbroken geographical surface, over which the wind could have a sweep so continuous and uninterrupted.

**Progress of Electrical Science in America.**

At a scientific *soiree* recently held at the house of Hon. Peter Parker, in Washington, Prof. Page exhibited one of his small electro-static coils lighting up the Geissler vacuum tubes, by the motive force of one of the small thermo-electric batteries of Moses G. Farmer, of Salem, Mass. The illumination was continued through the entire evening; and the merit and elegance of the experiment for the parlor cannot be surpassed. By a single jet of gas the electric power is furnished with perfect constancy without the annoyance of noxious gases and corrosive acids. The members of the scientific club and many members of the American Academy of Sciences were present.—*New York Artisan*.

**Our Advertisers.**

Our circulation has largely increased during the past month, and as the JOURNAL takes hold of society, it will show itself to some extent in our advertisements. Of these already given to us, we have a word to say.

With one exception, all have been given to us unasked.

We owe an apology to our old friend Dr. BRADLEY, for sadly mangling his. In large type we gave the public to understand that he made his instruments of *Oxide* metal! And many wondered thereat. It should have read *OREIDE* metal, which is claimed to be richer and finer than brass. Dr. Bradley employs a large number of men, nine of whom devote themselves to making magnets of fine quality, ordered by operators who prefer those of his make, and who desire to own their own machinery. The doctor is driving a large and successful business and no one grudges him his well earned success.

The establishment of L. G. TILLOTSON & Co. is also crowded with work. Nearly one hundred sets of the new stock reporting machinery are being made by this house, besides the ordinary manufacture of telegraphic machinery in which it has dealt so largely and so long. Good work, promptly executed, at moderate rates, has made the house a strong and successful one.

No one needs to be told of the BISHOP GUTTA PERCHA COMPANY. Their manufactures are known everywhere as the finest and best. Cables, all kinds of chemical vessels, insulated office wire, artificial flowers, &c., are provided in the highest style of excellence and in the greatest variety.

We have to add to these the advertisement of CHARLES WILLIAMS, JR., of Boston, Mass., whose work we hear highly spoken of, and in that busy centre of living men and much work, supplies much of the telegraphic machinery of New England.

And here are the CHESTERS, the genteel, the gentlemanly, the polite Chesters, into whose workshop we have been stumbling for the last twenty years. Alike in Philadelphia as CHESTER, PATRICK & Co., and in New York as C. J. & N. CHESTER, they thrive, improve, turn out the finest work, and aid inventors by their own clear brains.

We have received from Mr. W. R. Allison, the proprietor of the Brooks Insulator, the advertisement which appears on our last page, and to which we call attention. A highly flattering testimonial has been given by the French Telegraph Directory, which will be found elsewhere. To the use of paraffine these insulators undoubtedly owe their reputation.

One more. JOHN POLHEMUS is our printer. His office is at 102 NASSAU ST. Prompt and truthful he performs his work with the utmost skilfulness and despatch. In a few hours, the longest legal documents are delivered correct and complete. There is no man who deserves a larger patronage. His foreman is a lightning express, and the youngest imp is as smart as a Wheeler & Wilson.

Gentlemen, go on and prosper. You have our paternal benediction.

Mt. Hope Nurseries, Rochester, N. Y.

**How Faraday Chose Poverty.**

In a recent lecture at the Royal Institution in London, Professor Tyndale gave some interesting facts respecting the late Professor Faraday. At one period of his life the question was brought before Faraday whether he should choose wealth or science, and he determined to reject the seductions of riches, and to devote himself to science, with its comparative poverty. After the discovery of magneto-electricity numerous offers were made to him by which he might have acquired a large fortune. In 1832-33, he did gain, from the direction of his professional knowledge, commercially, upwards of £1,000 per annum; and Professor Tyndall said that he might readily have made £5,000 a year, but Faraday afterwards confined his attention almost exclusively to scientific investigations, his income from commercial applications being limited to such small sums as £25 or £100 per annum. During the last ten years of his life he received nothing from that source, and though he might have acquired a fortune of £150,000, he died a poor man.

In 1835 Sir Robert Peel proposed to grant him a pension, and the offer was renewed by Lord Melbourne, who sent for Faraday to speak to him about it, but not being accustomed to deal with so unsophisticated a person, who paid little regard to money, Lord Melbourne made some remark which gave offence to Faraday, who withdrew. A lady, who was a mutual friend of the minister and of the philosopher, endeavored to reconcile them, but Faraday told her that he would only consent to see Lord Melbourne again on one condition, with which he could not expect him to comply, and that was, that he should make an apology. In a few days, however, the apology came.

Faraday, entertaining the notion that there was Irish blood in his veins, and, as Professor Tyndall observed, there was an enthusiasm about him which appeared to countenance such an opinion, but in other qualities he was not Irish. One of these was his love of order. All the experiments he made in the laboratory of the Royal Institution were numbered, and they were often referred to in succeeding experiments; he also kept a private record of his experiments, the last one being numbered 16,541.

Professor Tyndall concluded by giving an affecting account of Faraday during his illness, and read two letters which he had written, in one of which, dated in the autumn of 1865, he alluded to his loss of memory, and of his not being able to recollect at the end of one line what he had written in the line before.

**The Alpine Horn.**

The Alpine horn is an instrument made of the bark of a cherry-tree, and like a speaking trumpet, is used to convey sounds to a great distance. I have heard, when the last rays of the sun gild the summit of the Alps, the shepherd who inhabits the highest peak of these mountains take his horn and cry with a loud voice, "Praise ye the Lord." As soon as the neighboring shepherds hear him, they repeat these words. The sounds are prolonged many minutes, while the echoes of the mountain and grottoes of the rock repeat the name of God. Imagination cannot picture anything more solemn or sublime than such a scene. During the silence that succeeds, the shepherds bend their knees and pray in the open air, then repair to their huts to rest. The sunlight gilding the tops of those stupendous mountains upon which the vault of heaven seems to rest, the magnificent scenery around, and the voice of the shepherd sounding from rock to rock the praise of the Almighty, fill the mind of every traveler with enthusiasm and awe.

It is just as hard to make one's self a poet  
As for a sheep to make itself a goat.

**Electric Safety Lamp.**

The danger of explosion in coal mines from the careless use of Sir Humphry Davy's safety lamp has been frequently demonstrated. It is proposed to obviate this danger by the introduction of a lamp composed of Geissler tubes properly protected by wire and driven by a small Ruhmkorff coil and battery carried in a knapsack on the back of the workman. These tubes have the air pumped out of them and the light comes from a constant stream of electricity passing from one end to the other. If the glass breaks, no fire can be communicated to the outer gases, as the connection with the battery is broken at the same instant and no spark can pass. This kind of a lantern could be used by travellers for reading at night on the railroad, as the whole apparatus can be carried in a carpet bag and can be easily suspended from a hook.—*Am. Journal of Mining.*

**The Time will Come.**

"The time will come!" the weary heart,  
Worn by its conflict with the world,  
Sighs, as though longing to depart  
For realms where Sorrow's wings are furled,  
Where Falsehood can not enter in,  
Where love and friendship ne'er grow cold,  
But perfect truth and beauty win  
Each heart within their tender fold.  
To meet again the loved and lost,  
To hear those tones Death bade be dumb,  
We pray—though here so tempest-tost—  
"The time will come—the time will come!"

**The Government and the Telegraph.**

The fact that the proposal to take the telegraph system out of the hands of the people of England came from the Cabinet, shows that it is a Government measure, rendered desirable by the present condition of society, and not a desire of the people. The general sentiment is against it. All feel, except those who are outside of the pale of the popular sympathies, that it is a dangerous addition to power already centralized enough.

Upon this subject the *Engineer*, a paper of a high order of excellence, remarks as follows:

"With our railway system has sprung up that system of electric telegraphy which has been so generally adopted and usefully employed throughout the country. This branch of engineering has reached a high degree of excellence. We rejoiced with those who successfully linked the old and new worlds. We felt thankful that their skill, industry, perseverance and enterprise had been rewarded with the success that marks the event as an era in history. The present period is a critical one for those who have devoted their attention to the telegraphic system of this country, for it is not impossible that Parliament in the ensuing session may be asked to adjudicate upon a measure by which the telegraph system of the country may be handed over to the Post-office authorities. We cannot but see that the proposed measure is one of those steps tending to centralize power in the hands of Government, and it may have the effect of stopping the efforts of private enterprise. It may tend to cramp the spirit of the enterprise of the country, and should be carefully watched by those interested in the development of all public works."

In Canada, also, the same scheme is proposed and met by a like resistance. No people accustomed to liberty can regard the measure with favor, or long tolerate it if successful. To Americans it would be exceedingly repulsive. We have no fear of its adoption, although for the present, apparently, sustained by one or two men of ability and prestige. An intelligent man cannot be found, who, upon a full exposition of the whole case, the spirit of our system of government, the impatience of the people under espionage of any kind, and the general necessities of the business, will not admit the impolicy and im-

practicability of the scheme. It has supporters only among those whose noses have been unjointed by existing lines, or who think every thing European superior to our own.

### Violation of the Telegraph Law—Arrest of an Operator.

On the 11th of February we received a private dispatch from our special correspondent in Washington, stating the rumor that the Secretary of the Treasury had ordered the sale of ten millions dollars of gold, and that impeachment was considered dead. This despatch came over the wires of the Franklin Telegraph Company, and was received by us before two o'clock. Shortly afterwards our book-keeper, Mr. John Butcher, received the following note:

"MR. BUTCHER—My dear Sir: Please learn if the enclosed is true. It is quite important to me, and will oblige your old friend.  
JOHN SAMMOND."

The enclosure alluded to was as follows:

"EVENING POST will contain despatches stating that the Secretary of the Treasury has ordered the sale of ten million dollars gold: also that impeachment is dead."

Mr. Butcher handed over the note and enclosure to another person, who found that such despatches had been received and were then in press. The question then arose, "How did this man know what was to appear in the EVENING POST before it was published?" and on taking our despatch and the memorandum referred to, to the office of the Telegraph Company, they were at once identified as the handwriting of one of the telegraph operators named Roche. We thereupon addressed a protest to the president of the telegraph company, who was absent from the city at the time, detailing the fact that our private despatches were appropriated by others in passing through his office, and on its receipt he ordered the arrest of Roche.

At the examination of Roche at the Tombs on Saturday last, it appeared that the same information as that conveyed in our despatches was telegraphed to four banking houses in this city on the same day, and the affidavit on which he was arrested charges that Roche surreptitiously conveyed the substance of those despatches to Mr. John Sammond, a gold broker in Broad street.

A messenger was sent to Mr. Sammond's office to summon him, but he could not be found.—*Evening Post.*

Since the above was published Mr. Sammond has acknowledged the reception of the message, and Roche has been held to bail to wait the action of the Grand Jury. Why was not the broker treated in the same way, for thus debauching Telegraph employees? Were that done, and a few street-brokers made to smell the Tombs for a month or two for such offences, it would aid the public morals.

### Chamber of Commerce, San Francisco.

At the banquet given recently on the occasion of the opening of the new building for the Chamber of Commerce, San Francisco. The following toast was given:

"The Magnetic Telegraph—The nervous system of commerce animated by the lightning, which obeys the human will and flashes the intelligence of merchants between the trade marts of the world."

"G. H. MUMFORD, of the Western Union Telegraph Company, responded, and among other remarks, said: 'The one thing, above all others, which the Telegraph represents, is the unity of that body whose nerves it supplies. Your interests are hemmed in by no city limits, or State lines, or national boundaries, but are wide as the whole earth, co-extensive with the whole human race. And the Telegraph is the visible sign and bond of that union—the wedding-ring with which commerce has encircled the earth.'"

During the festivities of the evening, which were of the most sumptuous character, the President read a message of congratulation from Hon. W. E. Dodge, President of the New York Chamber of Commerce, and regretting that until the Pacific Railroad united the Eastern and Western gates of Commerce, their invitation to join them could not be accepted.

Offices not receiving the JOURNAL, should immediately notify their Superintendent.

## Telegraphers' Mutual Life Insurance Association.

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

J. D. REID, Treasurer.

### DIRECTIONS TO APPLICANTS.

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage, and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

WITH THE

IMMERSED PLATINUM CONNECTION,

Make, beyond question, the most perfect Battery yet produced. We have abundant testimony of their GREAT SUPERIORITY OVER ANY OTHER.

We particularly invite attention to our whole arrangement of the

CARBON BATTERY,

Proving, as it does, that as much strength may be obtained from this Battery as the Grove, with far less expense.

IMPROVED TELEGRAPH INSTRUMENTS,

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed. His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them.

Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 13, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-900th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

BUNNELL'S REPEATERS,

lately patented, and now pronounced the simplest and best extant, furnished in splendid style.

PRICES.

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	18 00
Main Sounders same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	4 50 to 6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package.

He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers' prices.

## TESTS OF SPEED.

### Transmission of Dispatches by the Morse Telegraphic Apparatus.

OFFICE OF THE W. U. TEL. CO.,  
CLEVELAND, O., Feb. 26, 1868.

Hon. Wm. Orton, President W. U. Tel. Co., N. Y.:

DEAR SIR—In compliance with Executive Circular No. 4, the accompanying documents, showing the results of several "Speed Tests" made in this Division, are very respectfully submitted.

Doc. C. gives two experiments not embraced in the Table of Results, as follows:

Fifty-nine words were transmitted from Chicago, through a direct circuit of 1,650 miles, to Salt Lake in two minutes.

One hundred and fifty-four words were transmitted from Chicago to Salt Lake, through two Repeaters, a distance of 1,650 miles in three minutes and five seconds.

#### TABLE OF RESULTS.

Designation.	No. of words each message.	Total No. of words.	Time in transmission.	Average words per minute.
Doc. A.	40	800	30min.	26%
Doc. B.	40	800	25 "	32
Doc. C.	60	1200	36½ "	33
" "	24	480	14 "	34 2-7
" Report		965	26 "	37 1-9
" "		2631	60 "	43 5-6
Doc. D.		2530	60 "	42 1-6

Very respectfully,

ANSON STAGER,  
Genl. Supt. Central Division.

"Doc. A."

TEST OF SPEED MADE UPON THE LINES OF THE  
WESTERN UNION TELEGRAPH COMPANY AT  
ST. LOUIS, MO., JAN. 18, 1868.

No. of messages, 40; time, 30 minutes; average 26½ words per minute.

John H. Dwight, of the City and County of Leavenworth, in the State of Kansas, being by me first duly sworn deposes and says, that he is Manager of the Western Union Telegraph Office located in the said city of Leavenworth; that the enclosed copies of telegraph dispatches, numbering from one (1) to forty (40) inclusive, were received by me by telegraph with the Morse apparatus from St. Louis, Missouri, passing through a Hick's repeater at Kansas City, in the said State of Missouri, in the space of thirty (30) minutes; that the distance from St. Louis to Leavenworth by the line on which said dispatches passed is, to the best of my knowledge and belief, three hundred and ten (310) miles; that the transmitting operator is John H. French, chief operator of the said Western Union line at St. Louis, Missouri.

JOHN H. DWIGHT,  
Manager W. U. Tel. Office.

Sworn and subscribed to before me this 15th day of January, A. D. 1868,

C. D. ROYS, Notary Public.

"Doc. B."

TEST OF SPEED MADE UPON THE LINES OF THE W. U.  
TEL. CO., AT CLEVELAND, O., JAN. 28, 1868.

No. of messages, 40; time, 25 minutes; average, 32 words per minute.

The State of Ohio, County of Cuyahoga, ss.  
United States of America.

I, Charles F. Stumm, Telegraph Operator, Cleveland, Ohio, do hereby make affidavit that the annexed telegraphic messages, being forty in number, were transmitted by me on the twenty-seventh day of January, 1868, from Cleveland, Ohio, through a single circuit of 135 miles in length, using the Morse apparatus, in the space of twenty-five minutes; and that the manuscript herewith is that of the receiving operator, L. A. Somers, the said Somers taking the messages by sound, and transcribing them from the instrument as here shown.

CHARLES F. STUMM.

I, Samuel B. Roberts, was present, and witnessed the transmission of the messages here referred to, and certify that the above statement of C. F. Stumm is correct.

SAMUEL B. ROBERTS.

STATE OF OHIO, CUYAHOGA COUNTY, ss.

Before me, James M. Jones, a Notary Public in and for the State and County aforesaid, personally appeared the above named Charles F. Stumm and Samuel B. Roberts, the signers of the foregoing statements, and severally made solemn oath, that each and every of said statements are true.

Sworn to before me by said Charles F. Stumm and said Samuel B. Roberts, this 28th day of January, A. D., 1868, at Cleveland, in the State and County aforesaid. Witness my hand and official seal.

JAMES M. JONES,

Notary Public of said County and State.

"Doc. C."

TESTS OF SPEED MADE UPON THE LINES OF THE W. U.  
TEL. CO., BETWEEN CHICAGO, SALT LAKE,  
MILWAUKIE AND ST. PAUL, FEB., 1868.

No. of messages, 60; time, 36½ minutes; average, 33 words.

No. of Messages, 24; time, 14 minutes; average, 34 2-7 words.

No. of words of Press Report, 965; time in transmission, 26 minutes; average words per minute, 37 1-9.

No. of words of Press Report, 2631; time in transmission, 60 minutes; average words per minute, 43 5-6.

Gen. Anson Stager, General Supt. Western Union Telegraph Co., Cleveland, Ohio:

DEAR SIR—In accordance with instructions the following tests of speed in sending and receiving, using the Morse apparatus, have been made:

January 30, sixty (60) messages of 20 words each were sent from Chicago to Salt Lake with two (2) repeaters in circuit in thirty-six and one half (36½) minutes.

On the same night, by the same operators, fifty-nine (59) words were recorded in two (2) minutes without repeaters; distance 1,650.

February 1, twenty-four (24) messages of twenty (20) words each, were sent from Chicago and recorded at Omaha in fourteen (14) minutes in one continuous circuit; distance, 500.

February 14, one hundred and fifty-four (154) words were sent through two repeaters, Chicago to Salt Lake, in three minutes and five seconds, a verbatim copy of which was repeated back to Chicago office.

All the above tests between Chicago and Salt Lake were made by Mr. Valiquet, of Chicago, sender, and A. B. Hilliker, of Salt Lake, receiver.

In the absence of a copy of the business sent to Salt Lake, I would state that I have no doubt as to the copy taken being plain and legible, for during the celebrated Burch divorce trial the same operator received 2,621 words of a law speech in one hour, which was delivered to and published by the Chicago Tribune.

February 14, a report of nine hundred and sixty-five (965) words was sent through two repeaters from Salt Lake to Chicago by Mr. Sabin, and received by Mr. Kent of Chicago office. The copy made herewith enclosed, in twenty-six (26) minutes, which is a remarkable test for a distance of 1,650 miles of line, through two repeaters in the mildest of what is termed our January thaw.

I also enclosed tests made between Milwaukee and St. Paul on a continuous circuit four hundred and fifty (450) miles in length, by E. M. Shape of the Western Union Company, at Milwaukee, sender, and E. Curry, St. Paul, of the North Western Company, receiver, copies of which are herewith enclosed.

The first test in an hour, 2,280 words; second, 2,490 words; and the third, 2,631. The copies of the St. Paul and last Salt Lake tests, which are enclosed, you will observe are plain and well written. Two copies being taken in each case, one of each I herewith enclose.

I hereby make affidavit that the above statement in regard to trials of speed between Chicago and Salt Lake and Chicago and Omaha, using the Morse apparatus, has been examined by the persons who made and witnessed the trials, and that they whose names are signed below have certified under oath to the truth of this statement. And further, that the tests made and witnessed between Milwaukee and St. Paul as set forth in this statement, and an affidavit which is herewith attached, is true to the best of my knowledge and belief.

E. D. SWEET,

Supt. 13th Dis. W. U. Tel. Co.

H. C. Maynard, Night Manager; W. A. French; F. S. Kent, operator; Thos. L. A. Valiquet, operator. Sworn to and subscribed before me this 20th day of February, A. D. 1868,

CHARLES L. BOYD,  
Notary Public.

State of Wisconsin, Milwaukee County, ss.:

We hereby make affidavit that the annexed printed matter containing twenty-six hundred and thirty-one (2631) words was transmitted by telegraph from this city to St. Paul, Minn., a distance of 450 miles (by line), through one continuous circuit, using the Morse apparatus, by G. M. Shape, operator, on the 8th day of February, 1868, in the space of sixty minutes, and there received from the sound of the instrument by E. Curry, operator; and further, that the manuscript herewith, to the best of our knowledge and belief, is the original as transcribed from

the instrument at the time, by the said E. Curry, operator.

H. WELLER, *Manager*.

G. E. HINMAN, *Operator*.

Subscribed and sworn to before me this 21st day of Feb., A. D. 1868,

C. A. LOVELAND,

*Notary Public, Mil. Co., Wis.*

"Doc. D."

TEST OF SPEED MADE UPON THE LINES OF THE W. U. TEL. CO., BETWEEN CLEVELAND, O., AND NEW YORK, JAN. 29, 1868.

Press report; number of words, 2530; time, sixty minutes; Average, 42 1-6 words per minute.

*The State of Ohio, Cuyahoga County, ss.  
United States of America.*

I, Charles F. Stumm, Chief Operator Western Union Telegraph Office, Cleveland, O., do hereby make affidavit that the annexed twenty-five hundred and thirty words of Press Report was received by operator L. A. Somers, at this office from New York City, by the Morse apparatus, by sound, in the space of sixty minutes, between the hours of nine o'clock, fifteen minutes, and ten o'clock fifteen minutes, A. M., on the 29th day of January, 1868; and that the copy herewith is the original as transcribed by him from the sound instrument; and that the length of the circuit through which this report was transmitted from New York to Cleveland, O., using one repeater, is six hundred and thirty-one miles; and that the name of the operator transmitting from New York, is said to be R. J. Hutchison.

CHARLES F. STUMM,  
*Chief Operator.*

We, P. Bruner, J. P. McKinstry, and F. A. Stumm, being present and witnessing the receiving of the report above referred to, do make affidavit that the circumstances thereof, as set forth in the affidavit of Charles F. Stumm, are true and correctly stated.

P. BRUNER,  
J. P. MCKINSTRY,  
F. A. STUMM.

*The State of Ohio, Cuyahoga County, ss.  
In the United States of America.*

Before me personally appeared the within named Charles F. Stumm, P. Bruner, J. P. McKinstry, and F. A. Stumm, all signers of the foregoing statements in regard to the reception by telegraph, of twenty-five hundred and thirty words by sound by operator L. A. Somers, in one hour, at Cleveland, O., on the 29th day of January, 1868, and made solemn oath severally, that the statement aforesaid, signed by them, is true in all respects as they and each of them personally know.

Sworn to by each of the aforesaid parties, and by them and each of them subscribed in my presence, at Cleveland, in the County of Cuyahoga, State of Ohio, and United States of America, this 30th day of January, A. D., 1868. Witness my hand and official seal.

JAMES M. JONES,  
*Notary Public of said County and State.*

## Correspondence.

### Batteries and their Composition.

JAMESTOWN, Pa., February 2, 1868.

To the Editor Journal of the Telegraph:

SIR—The soundness of Mr. Varley's letters, and particularly of that one on page 2, No. 6 of the JOURNAL, on "Batteries and their Composition," leads me, and I presume others who take an interest in the *Science* of our profession, to desire that gentleman to give us more of the food with which he is so abundantly stored.

In all books that I have seen, it is given as a rule that the *quantity* of a battery is in proportion to the size of the zinc; in some the difference in *intensity* of the different batteries is not accounted for; while others attribute it to the resistance in the porous cup. Can a porous cup effect the intensity, or by its resistance do more than reduce the quantity the same as a

small wire or other imperfect conductor would do?

Would it not be more correct to say the *quantity* is in proportion to the amount of zinc oxydized; or rather would it not be still nearer the truth to say, the *intensity* of a battery is in proportion to the affinity of the elements that form the compound which is decomposed to furnish oxygen, and the *quantity* is in proportion to the amount of that compound decomposed, the zinc only serving as a material or agent to excite the decomposition?

To illustrate—take zinc as a standard for the positive plate, and use for the negative plate any metal which is passive to the solution or material in which it is placed. Is not the *intensity* of the Smee's battery equal to the affinity of oxygen for zinc, less the affinity of oxygen for hydrogen, and the *quantity* in proportion to the amount of water decomposed. In the Daniels battery is not the *intensity* equal to the affinity of oxygen for zinc, less the affinity of oxygen for copper, and the *quantity* in proportion to the amount of sulphate of copper decomposed?

In the Grove battery is not the *intensity* equal to the affinity of oxygen for zinc, less the affinity of oxygen for nitrogen, and the *quantity* in proportion to the amount of nitric acid decomposed?

In the materials mentioned, the affinity for oxygen decreases in the following order:

Zinc, hydrogen, copper, nitrogen and that compound—nitric acid—which holds its oxygen with the lightest affinity, gives us the greatest intensity.

To carry this principle further, what would be the result of combining the virtues of nitric acid and sulphate of copper by using nitrate of copper (No 5. C 4. O.)? This compound has one equivalent of oxygen more, and decomposes more easily than before mentioned. To carry it still further, suppose, instead of using nitric acid, we substitute chloric acid (ClO<sub>5</sub>) a compound which decomposes still more easily, and both elements of which have a very strong affinity for zinc and hydrogen, what would be the result? Is there not a general law which governs all Voltaic or Galvanic batteries, and is not the Daniel's battery (pardon me if I differ with Mr. Varley in this connection) subject to that law?

When Prof. Daniel put the negative plate in a solution of sulphate of copper, was it not in a material "which has a great affinity for hydrogen?" Was not that material *passive* to the copper plate? Did he "not get the sum instead of the difference of the forces" so far as the negative plate was concerned, and only the difference between the affinities? Did Prof. Grove accomplish more than this? If we replace the *copper* plate in the Daniels battery by one of *platinum* will we increase the current?

Several other questions present themselves, but I will reserve them for a future communication.

INVENTUS.

### Mr. Varley's Reply.

DEAR MR. REID:—Referring to the letter you have shown me, signed "*Inventus*," I make it a rule never to pay any attention to anonymous communications. As, however, the letter comes to me from you, I will consider it as yours and answer it.

The writer is perfectly correct in his supposition that the "*intensity*" (potential energy) of the battery is uninfluenced by the resistance of the porous cup. The *quantity* is exactly proportional to the amount of zinc dissolved, provided there be no local action—which latter is all waste. The amount of zinc dissolved, and consequently the "*quantity*" of the current is proportional to the potential energy, divided by the resistance of the whole circuit.

This, algebraically expressed, is  $Q = \frac{E}{R + r}$  when Q equals the quantity of the current.

E, the electro-motive force, *alias* Intensity, *alias* Potential energy. R, the resistance of the battery itself. r, the resistance of the rest of the circuit.

Suppose now, R to be very great, Q will be very small.

The value of E is constant only in the Thermoelectric pile, and for the following reason:

Let us examine the Grove battery. While the battery is at rest, the positive element, or zinc, is in contact with sulphuric acid and water. The Negative, or platinum plate, is in contact with nitric acid. On closing the circuit, hydrogen is evolved on the surface of the platinum, which, combining with the oxygen of the nitric acid, produces a film of water partially separating the platinum from the nitric acid, and therefore a somewhat similar result is obtained to that of using dilute nitric acid. The amount of water produced varies with the amount of work the battery is performing.

### COMMON SINGLE FLUID BATTERY.

The intensity of the battery is the result of the difference of affinities of the two metals for oxygen: for instance, if zinc and iron, as a battery, be accurately measured, and then iron and copper, and lastly, zinc and copper, it will be found that the intensity of the zinc-iron element, added to that of the iron-copper element, is equal to that of the zinc-copper element. This, however, is only true so long as the battery is connected with a very great resistance, and is therefore, *working* very slowly.

If a zinc-copper battery, charged with dilute sulphuric-acid, be attached to a very big resistance, its intensity will be found almost equal to the Daniels' battery. Let this battery work hard, and the hydrogen which is deposited upon the negative plate has to be taken from a state of combination or nascent state, and evolved in the form of gas; this is a work of labor, and the electric intensity is greatly reduced by this expenditure of force. This is best illustrated by using mercury as a negative metal.

As its affinity for oxygen is less than that of copper, the intensity of the zinc-mercury battery at the first moment is considerably greater. Owing to the smoothness of the surface of mercury, and possibly other causes, the hydrogen cannot assume the gaseous form and escape from it so easily as from a rough or platinized surface, and the result is that the mercury becomes, under its influence, as positive as the zinc, and consequently no further current is evolved.

### THE EFFECT OF NITRATE OF COPPER IN PLACE OF SULPHATE OF COPPER IN THE DANIELS' BATTERY.

The action of the battery is in this case to decompose the oxide of copper, and not the nitric acid, which latter is transferred to the zinc, forming nitrate of zinc. There is no increase of power from its use.

### THE USE OF CHLORIC ACID.

If my memory serves me right, it forms a battery a trifle less powerful than nitric acid. I have tried it as well as per chloric acid, per manganic acid and several other highly oxygenated compounds. They are all nearly in value to that of nitric acid, some a little greater, but the total difference is very small.

### THE EFFECT OF PLATINUM INSTEAD OF COPPER IN THE DANIELS' BATTERY.

If the platinum plate be immersed in sulphate of copper no increase of power will result. If a solution, say of chloride of platinum, be used instead of sulphate of copper, a great increase of power will result. But chloride of platinum is too expensive for economical use.

The last question but one—viz: "Is there not an affinity between hydrogen and sulphate of copper?"

This question does not arise in the Daniels' Battery; in the Smee's Battery the water is decomposed to oxidize the zinc; in the Daniels' Battery the sulphuric acid and oxygen of the sulphate of oxide of copper are transferred to the metallic zinc, forming sulphate of oxide of zinc, and it is the difference of the affinities of the zinc and copper for the oxygen and sulphuric acid which determines the potential energies of the Daniels' Battery.

Copper has a very decided affinity for oxygen, but zinc a greater.

C. F. VARLEY.

**Insurance.**

NEW YORK, March 9, 1868.

*To the Editor Journal of the Telegraph:*

Being one of the pioneers who organized the Telegraphers' Mutual Life Insurance Association, I desire to address a few words to the insured, and to those out of the pale of the association. I fear telegraphers are not coming forward as they should do to sustain this undertaking. Too much apathy is shown to the duty they owe to themselves, their family, to an aged parent, or perhaps to a dear sister depending upon their labor. The outlay and liability are small, very small in proportion to the good which may result. Will not the telegraphic fraternity, proverbial for their generosity, step forward, put their shoulders to the wheel, resolving to be more generous to themselves, to their own? What matter if you are insured elsewhere, give your co-laborers your influence and assistance by strengthening and sustaining the association.

To the already insured I would say, use each your individual exertion to add at least one other subscriber, thus benefiting both parties. You all know some friend in the business with whom a little persuasion would accomplish the desired object. Be true to him and yourself, and let us at no distant day be able to proclaim that all good telegraphers are within reach of the benefits accruing from the Telegraphers' Mutual Life Insurance Association. Its objects are well known. Its managers are of too well known wisdom and integrity to require vouchers. Come one! Come all!! Life is short at the longest. Let us all prepare to rob death of one of its chief terrors, that of leaving the dear ones in this cold and selfish world unprovided for. Prepare for his coming before whom the prayers of the loving ones at home availeth not, who demands his prey and is no respecter of persons.

MR. T. P. SCULLY, of 145 Broadway, has accepted a position of trust and honor in the service of the Panama Railroad Company, at Panama. We are sorry to lose him. Mr. Scully is a gentleman of unusual refinement and address, one of a class we trust yet to see multiplied in the service. He was one of the originators of the Telegraphers' Life Insurance Association, a few warm words for the success of which will be found above.

VALENTIA STATION, Ireland, Feb. 19, 1868.

*James D. Reid, Esq., 145 Broadway, N. Y.:*

DEAR SIR—I have received and with much interest perused your JOURNAL OF THE TELEGRAPH of the 1st February, 1868. It is just the sort of thing that is required amongst the telegraphic staff of the world; and, doubtless, if it becomes known throughout Europe, it will be patronized rather largely on this side the Atlantic.

There have been several attempts at something of the kind, but they have died a "natural death" either from their attempting too much for the money, or the support they received not covering the working expenses.

The operation recorded upon your fifth page of the number above referred to was most marvellous and must astonish the world. One little correction is, however, required, *i. e.*, the time we keep here is, for sake of uniformity, London time (or Greenwich mean time) for Valentia you must make an allowance of some 41 minutes—about which Dr. Gould can give you more information than I can—so that 7:21 our London time would be 6:40 our Valentia time.

Please send me two copies of back and future numbers, and also a copy of Professor J. E. Smith's *Manual of Telegraphy* advertised in the JOURNAL, and say how and how much I must remit you therefor. Wishing you every success,

I am, dear sir,

Yours, very truly,

JAMES GRAVES, *Supt.*

THE following "Personals, &c.," came too late for last issue:

PHILADELPHIA, February 27th, 1868.

J. D. REID, Esq.:

DEAR SIR—The afternoon train from Baltimore run off the track near Perrymansville, Md., on Friday last, February 14th, and demolished two (2) poles holding ten (10) wires belonging to the Western Union Telegraph Company, without causing a "cross" or breaking a wire. It is not often a case of this kind occurs, and it is to be hoped that other railroads will imitate the example of the P. W. & B. R. R., and thus avoid interruptions to the lines.

H. L. Cooper has resigned his position as operator at the Pennsylvania Railroad Company's West Philadelphia office, and has accepted a situation in the Pacific and Atlantic Company's main office, Third street, Philadelphia.

William Richards, manager of the Downingtown, Pa., office, has resigned. He has accepted the position of cashier in the new banking house of Kames & Smith, Downingtown, Pa.

George L. Shiver leaves the Bankers' & Brokers' office on March 1st, in consequence of a reduction of the force.

William E. Tinney leaves the Western Union Company's "C. P." office, Philadelphia, March 1st, in consequence of a reduction of the force. Mr. Tinney goes to the Western Union Company's Washington, D. C., office.

John Wintrup has resigned his position as operator in the Western Union Company's Philadelphia office. Mr. Wintrup leaves the employ of the Western Union Company for the purpose of engaging in business. The tribute we would pay Mr. W. has been justly earned by long and faithful services rendered the company. Your correspondent has had the pleasure of many years acquaintance and friendship with him, and the regrets are sincere at the dissolution of our business relations. Mr. Wintrup occupied the very responsible position of government operator at Wilmington and Newcastle, Del., in which position he received the official endorsement of his faithfulness and attention to the laborious duties devolving upon him. Success attend him in his new sphere. The writer feels confident that if he exercises but a tithe of his accustomed energies he cannot fail.

William C. Carson, receiving clerk Western Union office, Philadelphia, has resigned. Mr. Carson will engage in other business with his father. H. C. R.

PROF. S. F. B. MORSE has been elected one of the vice-presidents of the Yale Alumni Association of this city.

ALEXANDER BAIN was born in the north of Scotland, and served his apprenticeship as a watch and clock maker. About 1837 he came to London. It was at this time, while attending a lecture on electricity, his attention was drawn to its application to moving clocks and his electric telegraph.

AN operator asks: "What causes the roaring of wires at office windows?" Simply vibration by the wind, similar to the sounds produced upon an Eolian harp.

THE Washington chief of police telegraphed, March 5th, to Isaac E. Beecher and Nelson Drake, of Palmyra, N. Y., that Isaac Montrose, of that city, was dead, and asking directions respecting his burial. The message found both Beecher and Drake in their graves, and was answered by an executor.

THE other day a friend of a once resident of Penn Yan telegraphed him to look after a man who threatened to take advantage of the bankrupt law unless certain terms were accepted. The following answer was received:

New York office:

Message to — can't be delivered. Man has been dead six months. Can't reach him by this line.

**In Memoriam.**

"Here may thy storm-bett vessel safely ryde;  
This is the port of rest from troublous toyle,  
The world's sweet inn from paine and  
wearisome turnoyle."—*Spenser's Fairy Queen.*

CINCINNATI, O., March 1, 1868.

At a meeting called together by the telegraph operators of this city, Sunday morning, March 1st, 1868, to take action on the death of their brother operatives, Harry J. Keable and A. W. Raleigh, the following was transacted:

C. Mattoon was chosen chairman, and, on motion of Mr. E. C. Armstrong, Mr. C. L. Snyder as secretary.

The chairman appointed the following committees to draft resolutions:

Messrs. S. P. Peabody, M. B. Graham and C. M. Knox on the death of Mr. Keable; Messrs. M. C. Bristol, W. T. King and G. K. Smith on the death of Mr. Raleigh.

The following resolutions were presented by the respective committees, which were read and unanimously adopted:

*Whereas*, It has pleased the Almighty, in His Divine Providence, to remove from our midst our brother operator, Harry J. Keable.

*Resolved*, That, while we humbly bow to the Divine decree, we can but deeply mourn the loss to his associates of a genial companion and a warm-hearted friend, and, to his employers, of an operator of much more than ordinary ability.

*Resolved*, That we hereby extend to the relatives and many friends of our deceased brother our earnest sympathy in this their deep affliction.

*Resolved*, That a copy of this preamble and resolutions be forwarded to the family of the deceased, to the papers of his native place, and to the JOURNAL OF THE TELEGRAPH and Telegrapher of New York city for publication.

S. P. PEABODY,  
M. B. GRAHAM,  
C. M. KNOX, } *Committee.*

*Whereas*, It has pleased the Almighty to take from our midst our brother operator and esteemed friend A. W. Raleigh, and, while we bow with humble submission to the Supreme will,

*Resolved*, In his decease we lose an endeared associate, a credit to the fraternity, and an ornament to society.

*Resolved*, That we cannot too highly commend his religious and upright character, whereby he endeavored to fit himself for that "house not made with hands, eternal in the heavens."

*Resolved*, That we tender to his bereaved relatives and friends our sincere sympathy in their great loss, and that we send them a copy of these resolutions in token thereof.

M. C. BRISTOL,  
W. T. KING,  
GEO. K. SMITH, } *Committee.*

Understanding that the body of Mr. Raleigh would pass through the city on Monday morning to the final resting place, at Hamilton, Ohio, on motion of Mr. Armstrong, the chairman appointed a committee of four (Messrs. Mattoon, Hartman, King and Armstrong) to escort the body from the Little Miami to the Cincinnati, Hamilton and Dayton railroad depot.

After some minor transactions the meeting adjourned.

C. L. SNYDER, *Secretary.*

Mr. Keable died in Toronto, Canada, on the 16th of February. He was for some time employed in the Western Union office in Cincinnati, as night report operator, and, as such, very few, if any, could excel him. He was also engaged in the same capacity in the Western Union office in Louisville, Ky.

Mr. Raleigh died at Wilmington, Ohio, on the 27th of February. He also was for some time engaged in the Western Union office, Cincinnati, but more lately in Buffalo, N. Y., office. Both the deceased were worthy men who commanded the esteem of their associates, and we join in sympathy with them in their loss. We cannot too much commend the brotherly expression of grief and condolence which these resolutions evince. It is well perhaps to

"Weep not for him who dieth  
For he hath ceased from tears"

But to the bereaved, to every friendly heart, to that love to be remembered which speaks audibly in every true man, these memoria' rites are full of comfort and satisfaction.

## FRUIT AND ORNAMENTAL TREES,

GRAPE VINES, &amp;c., FOR SPRING 1868.

The Largest Stock in the Country. For sale in large or small quantities. A descriptive and illustrated priced catalogue of Fruits, and one of Ornamental Trees and Plants, sent pre-paid for 10 cents each. Wholesale Catalogue Free.

145 Broadway, New York.

NEW YORK, MARCH 16, 1868.

## Mr. Varley's Report.

It is not generally known that, soon after his arrival in New York, Mr. Varley, whose name has now become somewhat familiar in our columns, commenced an exhaustive examination of the structures, insulation, machinery, and modes of working of American lines. To this he has devoted a large share of the last three months, and has attested his diligence by a mass of statistical information—tests, diagrams, and recommendations occupying about 125 foolscap pages of well condensed manuscript. These pages are now before us, and we propose to give in successive numbers, extracts from this report for the benefit of, and to supply subjects of discussion to our large and increasing family. No more exhaustive report has ever been written, and our only regret will be that we will be unable to present it, with all its tests and formulas, so as to give a perfect idea of the amount of labor which has been spent upon it, the detail which characterizes it, and the scientific precision with which processes and results are stated. Yet all these will, to some extent, be made apparent.

Desiring and designing this JOURNAL to be a means of useful information to all who labor with us, we present one of the modes by which Mr. Varley proposes to avoid "cross currents," and which he states he has successfully used on the lines in England, Scotland and Holland.

The sketch shows the mode of affixing an escape wire, which is designed also to act as a lightning rod.

"Any current escaping from *a* along the wet arm *e*, on arriving at *f* finds a good easy channel down the wire *w* to the ground.

"Any electricity which may pass *f*, is arrested at *g*, *h* or *i*, and taken away before disturbing the working of *b*, *c* and *d* by getting into these circuits.

"The question which is likely to be asked is, 'if such wires be attached to the poles when the insulation is imperfect, will not nearly all the current escape to the ground?'

"To answer this question it becomes necessary to know the resistance (actually) of the following parts relatively to each other, or rather the ratio of *a* + *e* to *C*, viz.: the resistance of half the arm = *e*, the average resistance of the insulators *a* and *e* in their present condition, and *C* the resistance of the pole."

Here follows a series of tests giving the value of (*a* + *e*) and *C*, but they require so many diagrams to illustrate them, that we must postpone any attempt to do so. We give simply the result.

"Were conductors attached to the poles and arms, the insulation would decrease as 106.7 to 100, or as 7 to 6. This would have weakened the signal current on the wire on which the test was made from 30 per cent. to 27, a difference of 3 per cent., but would have removed mixing or disturbing cross currents from the other wires, amounting to 18 per cent., and which actually reduced the 30 per cent. down to 12.

The result, briefly stated is, that instead of a signal current varying from 12 to 30, caused so to be by the mixing of the currents of the wires, the use of an

escape wire would diminish the strength of the current 3 per cent., but give an unvarying signal current of the strength of 27.

When it is remembered that the current of wires on the same poles flow in a like direction, and hence have an antagonistic polarity when escaping or mixing at the arms or fixtures which support them, and that an escape wire between them gives these otherwise antagonistic polarities an unobstructed conductor to the earth, the slight diminution of strength claimed, viz., 3 per cent. will be regarded as remarkable. And yet Mr. Varley's experience in the use of the relieving wire is such, that in his Resume, he recommends as the very first thing to be done, to have these applied.

## More Wires for Cuba!

Gen W. F. Smith, President of the International Ocean Telegraph Company, left New York for England on Wednesday last, March 11, by the Cunard steamer Australasia, in company with our friend Mr. Varley, whose departure had been delayed by a multitude of social engagements.

Gen. Smith goes to London to procure a second cable to connect us with the saccharine plantations of Cuba, the intercourse with that sunny isle having so much increased as already to demand additional means of communication. When connection with Jamaica, St. Thomas and Panama are secured via this young and successful company's lines it will become one of the most important avenues of communication, and its property become increasingly valuable.

Meanwhile, direct wires are being provided from New York to Lake City in Florida, the connecting point of the lines of the Western Union Telegraph Company, so as to provide all possible means for the prompt and satisfactory dispatch of Cuban business, and the correspondence so soon to be opened beyond.

## Length of Western Union Company's Lines.

A very vague and incorrect idea prevails of the extent of the property of the Western Union Telegraph Company, which we may dissipate by the following illustration.

Suppose a terminal pole were stuck through the Herald Buildings in the City of New York, and the lines of the Western Union Co. extended therefrom in a direct line to San Francisco, Canton, Calcutta, Persian Gulf, French coast, and thence via Atlantic Ocean to New York, they would go twice round the world and leave enough of a residue to so encircle the marble building, corner of Broadway and Ann street, that its astonished occupants would be in a deeper darkness about the Western Union Company than ever before.

## Direct Line to India.

A company has been recently organized in London to build a telegraph line to the English possessions in India, with a capital of £450,000. The Electric and International Telegraph Company provide this company with two wires, as a part of the connection with the island of Norderney, on the North German coast. From thence to the eastern boundary of Prussia the Prussian Government agrees to build a double line of telegraph from Norderney to Thorn for the exclusive use of this company, letting it to them on a royalty per message. The Russian and Persian Governments give concessions for the extension of the line, via Warsaw and Tiflis, to Teheran, where the connection will be made with existing East India lines. This line will be finished in 1869, and give instant connection with the English possessions in India and the commercial posts of China, via the Atlantic cable.

PROFESSOR MORSE is now in Paris and leaves May 7th for New York. The recent trials of speed by the Morse apparatus have given him great pleasure, and have aided to increase the respect for him entertained in Europe. The Baron von Philipsborn, Chief Director of the Prussian Telegraphs, recently introduced Mr. Morse to a Postal Convention in Berlin as the "Father of the Telegraph." During that interview the Baron claimed that the success of Prussia in the war against Austria was largely due to the use of the telegraph. He also stated as follows: "We have a great variety of attempted improvements on your original invention, and it is marvellous how little it has been improved. The cry comes from all quarters of our Dominion, *send us the Morse.*" We need not say that in all these honors we take great pride and record them with the most lively satisfaction.

Mr. Morse, however, turns from his own offspring to a generous acknowledgement of the labors of others, referring to the instruments of Hughes, Casselli, and especially of Siemens, and still more recently of Mr. Henry Cook, the successor of the talented Bonelli recently deceased, characterizing them as admirable for their consummate ingenuity and well deserving attention as interesting modifications of his own. Experience alone can determine how far these can be introduced with advantage. We entertain the belief that ultimately the telegraph system to be speedy and correct, must be largely or wholly automatic.

"When sorrows come, they come not single spies,  
But in battalions."

We have recorded two deaths and the friendly rites connected therewith, and now there comes another:

After a brief illness, Mr. F. V. Barber of the New York office of the Associated Press, died March 2, at his residence at Stapleton, Staten Island, aged 38. Mr. Barber belonged to the old corps of telegraph men, one by one of whom are annually disappearing in death, or in connection with new pursuits. He was at one time manager of the Bain line office at Troy, and was widely known and beloved. Simple in his habits, expert in the duties confided to him, gentle and genial in his nature, warm in his sympathies, we feel his loss and mourn his departure. In this we are joined by all who knew him.

Several interesting communications are postponed for want of room.

**Telegraph Banquet in London.**

The circumstances which led to the banquet of the telegraph companies at the Palace Hotel, London, on Tuesday, March 10th, are not of general public significance in themselves, but are much so in their undoubted influence in the future management of international correspondence. No details have yet reached us, but we presume the banquet means that the Old Cable Company and the Anglo-American Company are united, and that all interests are now represented by a common Board of Control.

To many minds these amalgamations simply indicate a grasping after extended authority—the organization of monopoly. But experience teaches another lesson. The more unified the control and the larger the area of jurisdiction, the simpler and the cheaper, and the more effective are the possibilities of the system.

In the present case it is but the massing of two divisions of the same interest—one company having simply completed the work of the other, and now merging as at first contemplated. But it brings with it peaceful and healthful administration to a business which eminently demands them both.

The sentiments exchanged between London, New York, Washington and Havana, all transmitted and received while the guests sat at their congratulatory feast, is one of the evidences of the progress of science and the interesting character of the times in which we live. The ends of the earth are being rapidly brought together. We must soon have a common language to express a common sympathy and life.

**Telegraphic Congratulations.**

The following telegrams were received about two o'clock, P. M., and the replies forwarded during the progress of the banquet, the lines from Nova Scotia to Havana being connected, Havana sending direct to Plaister Cove:

PALACE HOTEL, LONDON, March 10, 7 P. M.

To the President of the United States:

The guests assembled at the telegraph banquet send their assembled greetings to the President of the United States, and trust that the telegraphic union between England and America may never be interrupted nor their friendship broken.

(Signed) C. W. FIELD.

PALACE HOTEL, LONDON, March 10, P. M.

W. H. Seward, Secretary of State:

The principal gentlemen in England that have been connected with establishing telegraphic communication between this country and America, now assembled around this table, send their kind regards to the Secretary of State, and remember with pleasure the interest he has always taken in telegraphic communication across the Atlantic.

CYRUS W. FIELD.

WASHINGTON, March 10, 3.30 P. M.

To Cyrus W. Field, Esq., Palace Hotel, London:

I congratulate the telegraphic builders that, instead of building a bridge for the tramp of hostile armies across the Atlantic, they have stretched a wire beneath it, which effectually exchanges friendly sentiments, sympathy and affections.

WILLIAM H. SEWARD.

WASHINGTON, March 10, 3.30 P. M.

Cyrus W. Field, Palace Hotel, London:

Express my congratulations to the Telegraph Festival Assembly. I wish them all possible success—that their wires may be multiplied through many seas, and their stakes extended around the world.

ANDREW JOHNSON.

PALACE HOTEL, LONDON, Tuesday, March 10, 7.15 P. M.  
Peter Cooper, Esq., President, New York:

The gentlemen now sitting around this table rejoice with you and the other directors of the New York, Newfoundland and London Telegraph Company, in the complete success of telegraphic communication between Europe and America, which was inaugurated thirteen years ago this date. Pray that it may continue to be a blessing to those two great kindred nations living on opposite sides of the Atlantic.

C. W. FIELD.

NEW YORK, Tuesday 2.35 P. M.

Cyrus W. Field, at the banquet, London:

Yours received two twenty-seven P. M.

The directors of the New York, Newfoundland and London Telegraph Company desire to join in the general joy produced by the harmonious action of the Atlantic and Anglo-American

companies, which promises so much benefit not only to the shareholders but to the world at large.

The co-operation of the Newfoundland Company can be confidently counted on in the measures which are now possible, and hence certain for the extension and cheapening of telegraphic facilities whereby the commerce of the world will be enlarged, and the bonds of peace between the nations be strengthened and confirmed.

PETER COOPER, President.

FIFTH AVENUE HOTEL, March 10, 1868.

To Mr. C. W. Field, Palace Hotel, London:

New York, Tuesday, 2.30 P. M. Yours received. All well. Tell your guests that if they will cross the ocean we will give them a welcome as hearty, "if possible," as our English friends have given to you.

MARY S. FIELD.

PALACE HOTEL, LONDON, March 10, 7.30 P. M.  
Hon. Wm. Orton, President Western Union Telegraph Company, New York:

There is now assembled around this board many of the principal telegraph men of England, and they present their compliments to you and the directors of the Western Union Telegraph Company, and trust that the telegraphic union between the old and new world may never be broken and the cordial relations now existing between the telegraph companies on both sides of the Atlantic may never be interrupted.

C. W. FIELD.

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
March 10, 1868.

Cyrus W. Field:

For the Western Union Telegraph Company's Directors and myself, accept and convey to your assembled guests reciprocal assurances of personal and business friendship. Those who do you honor on this occasion are not alone those who sit at your table. The latter are but the representatives of the countless host who, throughout the world within the influence of the press and the telegraph, sit daily at a feast of reason ever satisfying, but never satisfied, with whom your name shall be a household word for centuries to come.

(Signed)

WILLIAM ORTON.

Cyrus W. Field, London:

I leave to-morrow to get a second cable from Florida to Cuba. The Central American Company is organized. Gen. Sanford and our Vice-President in Havana can speak for themselves. Present the compliments of this company to their telegraphic brethren in England.

W. F. SMITH, President.

Cyrus W. Field, London:

We are about to drop a line to South America and hope the response will soon be vibrating over the Atlantic cable.

EDWARD S. SANFORD,

President Central American Tel. Co.

LONDON, 7.25 P. M., March 10.

Lieut. Gen. Francisco Lersundi, Captain-General of Cuba:

We rejoice with you that Cuba has been brought in telegraphic communication with the old world, and trust that your beautiful island will be soon connected with the Isthmus of Panama.

C. W. FIELD.

HAVANA, 5.24 P. M.

Cyrus W. Field, London:

Veo con placer y entusiasmo los adelantos que la ciencia logra cada instante y espero con ansiedad el día que usted me anuncie hallarase tambien unidos por el telégrafo con el resto del continente Americano par Panama pues sera un motivo mas de prosperidad para esta Isla.

LERSUNDI, Tarde Marzo Diez Cuatro y ocho.

During these salutations the operators had their own complimentary speeches—Nova Scotia sending the congratulations of the icebergs to the Cuban orange blossoms. Mr. Garcia, operator at Havana, seemed much rejoiced at his sudden introduction to his companions.

It was thought there was a very large battery on at the London terminus, and it has been suggested there may have been a small sustainer at Washington. In New York never a cup. It was very dry.

By Atlantic Telegraph.

LONDON, March 10.—A satisfactory arrangement has been effected between the Anglo-American and Atlantic Telegraph Companies, which, it is believed, will remove all the differences between them which have heretofore hampered the management of Atlantic Cable affairs. The details of the arrangement have not transpired.

BRIGHAM YOUNG is making telegraph operators out of the surplus wives of Utah.

OVER three hundred millions of matches are made and used daily in the United States, or about nine to each person of the population.

**TARIFF BUREAU.****Semi-Monthly Circular.**

WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
March 15, 1868.

TO ALL OFFICES ON W. U. LINES:

Please note the following changes in your Tariff Books, which have occurred since the 28th February, the date of the last Tariff Order:

**OFFICES OPENED.**

Berkshire, N. Y., tariff same as Dryden, N. Y.  
Charleston, Tenn., tariff same as Cleveland, Tenn.  
Chessoning, Mich., tariff same as Owasso, Mich.  
E. Liverpool, Ohio, tariff same as Wellsville, Ohio.  
Freeland, Mich., 10 cents more than to Saginaw Mich.  
Hydeville, Vt., same as Fair Haven, Vt.  
Jacobs Creek, Pa., same as Laytons, Pa.  
Linwood, Del. Co., Pa., same as Chester, Pa.  
Midland, Mich., 10 cents more than to Saginaw, Mich.  
Penobscus, N. B., same as Anagance, N. B.  
Piketon, O., same as Waverly, O.  
St. Stephens, N. B., same as Calais, Me.  
West Springfield, Mass., same as Westfield, Mass.  
Altoona, Pa.  
All offices beyond Pittsburg to add 30 and 8 to their present rates to these points to obtain the rate to Altoona; but the rate for other offices between Philadelphia and Pittsburg will remain as at present.

**OFFICES OPENED ON OTHER LINES.**

Cumberland, C. W., tariff 25 & 2 from Montreal.  
Onawa, Iowa, 220 & 17 from Chicago.  
Sioux City, Iowa, 270 & 22 from Chicago.  
Sloan, Iowa, 245 & 19 from Chicago.

**OFFICES CLOSED.**

Moreau, New York.

**GENERAL INFORMATION.**

Managers and clerks will please notice that the tariff circular under date of February 28, and published in the JOURNAL of March 2, is wrong in giving the rate for additional words. This should be ascertained as directed by tariff sheet giving rates from Washington and Louisville to points in the Southern Division, dated February 1, 1867, the scales for additional words being thereto attached.

North Vineland, N. J., office was opened last summer, the name was incorrectly given as Forest Grove, N. J.  
Camden Station, Baltimore Md., will hereafter be checked direct on all business whether paid or free.

WILLIAM ORTON,  
President.

**MARRIED.**

BENJAMIN—NAISBY.—January 23, 1868, by the Rev. Dr. Bomberger, at the bride's home, A. J. Benjamin of Western Union Telegraph Office, Salisbury, Md., to Miss Allena Naisby, of Philadelphia.

MR. O. M. DUNN, of Bromfield, Ind., desires us to publish a list of the numeral abbreviations of the Western Union Telegraph Company. He says: "I have been trying for the last two years to get a book or publication of some kind that has them, but so far have failed."

Both to this correspondent and others who both desire and need information on this and other subjects connected with their duties, we recommend the purchase of L. G. Tillotson & Co.'s latest edition of J. E. Smith's Telegraph Manual. It is very cheap, only 30 cents per copy, and is simple and practical. Address L. G. Tillotson & Co., 26 Dey street, New York. For two new subscribers and two dollars cash, we will send a copy of the Manual extra.

NATURE will be reported. All things are engaged in writing their own history. The plant and pebbles go attended by their own shadow. The rock leaves its scratches on the mountain side, the river channel in the soil, the animal its bones in the stratum, the fern and the leaf their modest epitaph in the coal. The falling drop makes its sepulchre in the sand or stone; not a footstep in the snow or along the ground but prints in characters more or less lasting a map of its march; every act of man inscribes itself on the memories of his fellows and his own face. The air is full of sound, the sky of tokens; the ground is all memoranda, and every object is covered over with hints which speak to the intelligent.

## Important Telegraph Law.

WASHINGTON, March 3d.

In the House of Representatives, Mr. Farnsworth, of Illinois, introduced a bill, of which the following synopsis is given, which was appropriately referred:

The first section confers jurisdiction upon the District and Circuit Courts of the United States in all suits or proceedings brought by or against any incorporated Telegraph Company.

The second enacts that if any person shall wilfully cut, break, displace, molest, injure or destroy any pole, wire or cable, or other appliances and property owned by any Telegraph Company, or shall wilfully destroy or impair the insulation of the wires, or interrupt the transmission of the electric current through the same, he shall be subject to a heavy fine and imprisonment.

The third, fourth and fifth sections provide for the manner of instituting and carrying on suits in courts under this bill.

The sixth section provides for the punishment by a fine of \$1,000 and imprisonment for one year of any agent, operator or employe of any such Telegraph Company, or any other person, who shall knowingly or wilfully send by Telegraph any false or forged message purporting to be from such Telegraph office, or shall wilfully deliver or consent to be delivered any such message purporting to have been received by Telegraph; and also any person who may conspire to furnish any operator or employe any message, knowing the same to be false or forged, with the intent to deceive, injure or defraud any individual, partnership or corporation and the public.

The seventh section enacts that any officer, agent, operator, clerk or employe of any Telegraph Company, who divulges to any other party than the party from whom the same was received, or to whom the same is addressed, any message received or sent over any Telegraph lines, or who alters a message in any way, shall be fined \$1,000, or imprisoned not to exceed one year.

The eighth section provides for the punishment of any operator who steals news off the wires, or speculates upon information acquired in sending messages.

The bill consists of fifteen sections, most of which are devoted to the protection of the public against frauds and injustice by the Telegraph Companies, their agents and operators.

## A Scientific Explanation: The Fire Bell Mixed.

Shortly before 12 o'clock this noon, the fire alarm bell sounded district No. 26 or No. 24, or some other number, and it kept sounding in a manner that indicated very much fire somewhere, if the volubility of the bell was to be relied upon. The steamers came out, and went to where the fire was, and it wasn't there; they then proceeded to the next best place where the conflagration was supposed to be, and found it in the same place where it wasn't in the previous locality. After wandering around promiscuously for a quarter of an hour, the department held a sort of mass convention on Central Row, and a big crowd collected to discuss the question. Meantime the alarm bell was doing its prettiest to toll out its mournful tidings. There was a good deal of swearing all around, but finally the trouble was cleared up.

It appears that in moving a house on Wethersfield avenue, one of the fire telegraph wires was broken, whereupon, *there being nothing to prevent*, the bell went to work vigorously as stated.

The cause of the difficulty is easily explained. When a wire is cut, the horizontal divergence of the positive current of the elective diaphragm ceases to vibrate on the ground swell, and the momentum of the axletree is therefore broken by the grand concussion of the self-repeater; whereupon the bell is seriously exaggerated to the fullness of its horizontal position! At any rate, this is as we understand it.

The accident, as a matter of fact, was made to tell upon the public by two boys, who picked up the broken wire, and amused themselves by touching the two ends together, which funny operation they repeated till the cause of the trouble was discovered.—*Hartford Times*.

ECONOMY in fuel might be greatly promoted if the consumer would imitate the practice of good firemen in sprinkling over the surface of the fire a thin layer of coal as often as required. By this method the gases from the fresh coal are not wasted, as they are when the coal is put on in great quantities at a time, when nearly all the gas goes off unconsumed.

## A Subterranean Lake of Boiling Water.

The *La Crosse* (Wisconsin) *Democrat* tells the following remarkable story: "This afternoon, about 3 o'clock, the residents of the eastern part of the city were startled by a loud report, resembling the discharge of a park of the heaviest artillery. Many supposed it to be occasioned by blasting operations at the stone quarries east of the city; but the fact was soon ascertained that the explosion occurred at the artesian well that has been sunk to the depth of 280 feet, and situated about midway between the river and the bluffs.

The workmen at the well became sensible of a remarkable change going on within the bore. The drill had been working through a substratum of dark porous rock for five hours, and had been making rapid progress, when suddenly the machinery stopped, the rods became violently agitated, and a deafening explosion ensued, followed by a stream of boiling water gushing with a mighty force through the tube from the depths below. The startled workmen were blinded by clouds of steam. Geo. Hayes, the workman in charge of the drill at the time, had a very narrow escape. He received a jet of boiling water in his neck and breast, but was partially protected by heavy woollen clothing. William Marks, another operative, was badly scalded about the feet and ankles. Patrick Cox, Andrew Parkman and Karl Snyder, the remaining workman, were but slightly injured. The horses became panic-stricken, and reared and plunged violently, and, extricating themselves from the harness, dashed madly over the frozen prairie in the direction of the bluffs.

The upward pressure of the water is very great, certainly not less than two hundred pounds to the square inch. The mean temperature is about 183 of Reaumur's thermometer.

Of course, all conjectures as to the extent of the submarine lake, and the length of time which the boiling water will continue to flow, must for the present be purely speculative. Dr. Percival, late State geologist, was of opinion that far beneath the bed of the Mississippi there existed another stream flowing in the same direction of much greater magnitude, and whose waters were of a much higher temperature than the waters of the river.

The well has been visited by crowds of citizens, and the singular phenomenon has given rise to much speculation and wonder. Many strange theories have been advanced. One scientific gentleman who has had wide experience in geology, as well as much practical knowledge of mining operations, is of the opinion that the friction of the drill has ignited some hidden reservoir of highly inflammable oil or gas, the intense heat of which has caused the water to boil and seek an outlet through the bore of the well. Other intelligent parties entertain widely different views, and the flowing well of boiling water bids fair to furnish a prolific theme for scientific investigation.

The extensive vineyards of the Hon. Edwin Flint and George A. Metzgar are in imminent danger of being submerged by the boiling flood. We trust that the Artesian Well Company will not be subject to any vexatious litigation in consequence of this unforeseen and unparalleled occurrence. Fortunately those of our citizens who are the owners of property liable to be inundated are wealthy, public spirited gentlemen, who will not take advantage of this break of the elements to embarrass this enterprising project. The snow for a space of about six acres has entirely disappeared, and the brown grass of the prairie swollen by the heated element, has assumed wild and fanciful shapes.

The strange spectacle of a great column of steam rising from the midst of the vast snow-clad plain in mid-winter, is indeed singular, and impresses upon our minds at once a sense of man's weakness, and awakens us to a faint conception of the awful power of the hidden elements beneath our feet.

**The Secrets of the Ocean.**

Mr. Green, the famous diver, tells singular stories of his adventure when making search in the deep waters of the ocean. He gives some new sketches of what he saw at the "Silver Banks," near Hayti:

The banks of coral on which my divers were made are about forty miles in length, and from ten to twenty in breadth. On this bank of coral is presented to the diver one of the most beautiful and sublime scenes the eye ever beheld. The water varies from ten to one hundred feet in depth, and so clear that the diver can see from two to three hundred feet when submerged, with but little obstruction to the sight.

The bottom of the ocean, in many places, is as smooth as a marble floor; in others it is studded with coral columns, from ten to one hundred feet in height, and from one to eighty feet in diameter. The tops of those more lofty support a myriad of pyramidal pendants, each forming a myriad more, giving reality to the imaginary abode of some water nymph. In other places the pendants form arch over arch; and, as the diver stands on the bottom of the ocean, and gazes through in the deep winding avenues, he finds that they fill him with as sacred an awe as if he were in some old cathedral which had long been buried beneath old ocean's wave. Here and there the coral extends to the surface of the water, as if the loftier columns were towers belonging to those stately temples that are now in ruins.

There were countless varieties of diminutive trees, shrubs and plants in every crevice of the corals where water had deposited the earth. They were all of a faint hue, owing to the pale light they received, although of every shade, and entirely different from plants that I am familiar with that vegetate upon dry land. One in particular attracted my attention; it resembled a sea fan of immense size, variegated colors and the most brilliant hue. The fish which inhabit these "Silver Banks" I found as different in kind as the scenery was varied. They were of all forms, colors and sizes—from the symmetrical goby to the globe-like sunfish, from the duldest hue to the changeable dolphin.

**Phrenology in the Montreal Post-Office.**

The post-office is not a place that would be suspected as a source of fun, far less as a field for the acting of a serio-comic drama. It appears that phrenological qualification is now necessary to retain a position in that office. For some time past the post-master was not satisfied that all was right, and being a firm believer in the development of certain bumps, he had the heads of the clerks of the establishment examined, and the result was most unsatisfactory in the case of three of those employed in the office. The moral and intellectual bumps were found deficient, so much so that it was impossible to retain these gentlemen any longer as public servants. It is not known whether the same experiment will be made in the other branches of the public service.—*Montreal Telegraph.*

**Effect of Darkness and Silence.**

Under the above heading a report has appeared from Dr. Ralls Smith, who says he is "confident that the sense of hearing, as well as that of sight, is lacking among the fishes in the mammoth cave."

Prof. Agassiz and Prof. Wyman have demonstrated that the fishes in the cave, of which there are several species, are all blind; that they all have rudimentary orbits, developed in some species more than in others; but that, at the same time, all have large well developed auditory organs, even larger in proportion than ordinary fish. See "Silliman's American Journal" for March, 1854.

Prof. Silliman visited the cave in 1850, and states that the cave rat possesses, when first captured, a very imperfect, if any, sense of vision, which, however, appears to improve when kept long in the light; but this same rat is extremely shy; and notwithstanding the cave is full of innumerable tracks, they are seldom seen, as they flee when hearing the approach of man.

Dr. Smith asserts that these animals are deaf, because there is nothing to be heard, forgetting that they make sounds by their own movements, and produce articulate sounds. It would be more probable that very acute hearing in these animals compensates for the loss of sight, as is the case with the blind in general.

**Telegraphers'****Mutual Life Insurance Association.**

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL.

Executive Committee.

J. D. REID, Treasurer.

**DIRECTIONS TO APPLICANTS.**

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed.  
His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them. Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

## PRICES.

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00

## EASTERN DIVISION.

### TESTS OF SPEED.

#### Transmission of Dispatches by the Morse Telegraphic Apparatus.

THE W. U. TELEGRAPH COMPANY,  
Office of the Gen'l Supt. of the  
Eastern Division,  
145 Broadway, N. Y., March 23, 1868.

Hon. Wm. Orton, President W. U. Tel. Co., N. Y.:

MY DEAR SIR—In compliance with Executive Circular No. 4, Mr. A. S. Brown, Manager of New York office, was instructed to conduct several trials of speed in telegraphic transmission by the Morse apparatus. I respectfully submit herewith Mr. Brown's report and affidavit, together with the sworn statements of Messrs. Tinker and Merrihew, Managers at Washington and Philadelphia, showing the following result:

	No. of messages.	Words in each message.	Total No. of words.	Time occupied.	Average words per minute.
First Trial,	Report.		2224	60 min.	37 1-15
Second "	94	30	1890	60 "	31 1-3
Third "	Report.		2514	60 "	41 9-10
Fourth "	"		1352	30 "	45 1-15
Fifth "	"		2540	60 "	42 1-3

I respectfully invite attention to the length of time each trial was continued, and to the excellence of the original copies herewith enclosed.

Very truly yours,

THOS. T. ECKERT,  
Gen'l Supt. Eastern Division.  
NEW YORK, March 21st.

Gen. T. T. Eckert, Gen. Supt.:

In compliance with orders received from you, a number of tests have been made, with a view of ascertaining the highest attainable speed by the Morse system of telegraphing. I herewith submit the following statement showing the results of these tests.

Yours, very respectfully,

A. S. BROWN,  
Manager N. Y. Office.

JANUARY 19, 1868.—Mr. M. Mareau, chief operator in the Western Union Telegraph Office at Washington, sent to Wm. Wallace, Jr., operator at Buffalo, two thousand two hundred and twenty-four (2,224) words of press report in one hour, through a repeater at New York. The length of this circuit is six hundred and sixty-three (663) miles. The report was copied by Mr. Wallace on manifold sheets, three copies being taken, one of which accompanies this.

JANUARY 19, 1868.—Mr. W. E. Kettles, an operator in the W. U. Telegraph office at Washington, sent to Plaister Cove, C. B., ninety-four (94) messages of twenty (20) words each in one hour. A copy of these messages was also taken at this office in passing. The distance from Washington to Plaister Cove, by line, is, to the best of my knowledge and belief, fourteen hundred (1400) miles. Repeaters were used at New York and St. John. The messages were received at Plaister Cove by Messrs. Reese and Sherman. Their copies have not been received here, but the messages were afterward repeated back to Washington and found to be correct. The originals, as sent from Washington, and the copies taken here, are enclosed.

JANUARY 21, 1868.—D. F. Marks, night manager, and Charles Bagley, operator in the New York office of the W. U. Telegraph Company, sent to N. Snyder, operator at Philadelphia, two thousand five hundred and fourteen (2,514) words of press report in one hour. The distance, by route of the line, is ninety-one (91) miles. The copy of this report, taken by Mr. Snyder, is herewith enclosed.

FEBRUARY 19th, 1868.—Mr. R. I. Hutchinson, an operator in the Western Union Telegraph Office at New York, sent to N. Snyder, operator at Philadelphia, one thousand three hundred and fifty-two (1,352) words of press report in thirty (30) minutes. This report consisted of ordinary telegraphic news, cut from a paper of that date. The original of this report is enclosed.

FEBRUARY 20th.—Mr. Edward Stewart, of the Western Union Telegraph office, Washington, sent to Mr. N. Snyder, at Philadelphia, two thousand five hundred and forty (2,540) words of press report in one hour. This report was a speech delivered by M. Thiers in the French legislative body on January 19.

A. S. BROWN,  
Manager of New York office.

City and County of New York, ss.:

On the 23d day of March, A. D. 1868, before me personally appeared A. S. Brown, to me known to be the manager of the New York office of the Western Union Telegraph Company, who, being duly sworn, deposes and says, that the foregoing statements, by him subscribed, in respect to five several tests of speed in telegraphing by the Morse system, are true and correct in every particular to the best of his knowledge and belief.

R. M. ROCHESTER,  
Notary Public.

City of Philadelphia, ss.

Personally appeared before me, an Alderman in and for said City, Lant. S. Jones, who being duly sworn according to law, says, that on January 21st, 1868, Nicholas J. Snyder, operator at Philadelphia, Pa., received from Mr. W. F. Marks and Charles Bagley, operators at New York, a portion of press report, containing, to the best of my knowledge and belief, 2,514 words; time occupied, one hour.

LANT. S. JONES,  
Night Chief Operator, Philadelphia.

Sworn and subscribed before me, March 20, 1868,  
JOHN WHITE,  
Alderman.

City of Philadelphia, ss.

Personally appeared before me, an Alderman in and for said City, James Merrihew, who being duly sworn according to law, says, that on February 19th, 1868, Nicholas J. Snyder, operator at Philadelphia, Pa., received from Mr. R. J. Hutchinson, operator at New York, a portion of press report, containing, to the best of my knowledge and belief, 1,352 words; time occupied, 30 minutes. This report consisted of ordinary telegraphic news, cut from a paper of that date.

JOHN MERRIHEW,  
Manager Philadelphia.

Sworn to and subscribed before me this 20th day of March, A. D., 1868,  
JOHN WHITE,  
Alderman.

City of Philadelphia, ss.

Personally appeared before me, an Alderman in and for said City, James Merrihew, who being duly sworn according to law, says, that on February 20th, 1868, Mr. Nicholas J. Snyder, operator at Philadelphia, received from Mr. Edward Stuart, of W. U. Telegraph Co.'s Washington office, a portion of press report, containing, to the best of my knowledge and belief, 2,540 words; time occupied, one hour. This report was a speech delivered by M. Thiers in the French legislative body, January 29th.

JAMES MERRIHEW,  
Manager, Philadelphia.

Sworn and subscribed before me this 20th day of March, A. D., 1868,  
JOHN WHITE,  
Alderman.

Charles A. Tinker, of the City and County of Washington, District of Columbia, being by me first duly sworn, deposes and says that he is manager of the Western Union Telegraph Office located in the said City of Washington; that M. Mareau, chief operator of said Washington office, sent, on January 19th, 1868, twenty-two hundred and twenty-four words of press report over a wire between Washington, D. C., and Buffalo, N. Y., in one hour. This circuit is to the best of my knowledge and belief, six hundred and sixty-three miles in length, and was worked through repeaters at New York. The report was received and copied by Mr. Wallace, operator at Buffalo, without once breaking. On the same day, January 19th, Mr. Wm. E. Kettles, operator in said Washington office, sent to Plaister Cove, Cape Breton, ninety-four messages, containing twenty words each, in one hour. This circuit, to the best of my knowledge and belief, is fourteen hundred (1400) miles in length, and was worked through repeaters at New York and St. Johns, N. B. The messages were received at Plaister Cove by operators Reese and Sherman, and were afterwards repeated back and found to be correct.

On February twentieth (20th), Mr. Edward C. Stewart, also an operator in said Washington office, sent to Philadelphia twenty-five hundred and forty (2,540) words of press report in one hour, being received and copied by Mr. Snyder, an operator in Philadelphia office. This report consisted of the first half of a speech delivered by M. Thiers before the French Legislative body, January 29th, and was sent from the copy printed in the New York Tribune, February 18th, 1868.

CHAS. A. TINKER.  
Sworn to and subscribed before me, this 20th day of March, 1868.

E. L. CORBIN,  
Justice of the Peace.

[SEAL.]  
All the manuscript connected with the above tests we have in our possession for transmission to the Paris Commission on Telegraphs, and we certify to its clearness, correctness and regularity. There is no evidence of unusual haste, and, except in two or three places, no change or correction of any kind appears.

ED. JOURNAL OF THE TELEGRAPH.

An exchange says the present insatiable appetite for "latest news" makes man appear to be a telegraphivorous animal.

## Correspondence.

## Voltaic Electric Induction.

NEWCASTLE, Del., February 21st, 1868.

To the Editor Journal of the Telegraph:

In my first article on this subject I had the manliness to attach my signature. Your correspondent, T, in commenting upon it, does not.

He doubts the accuracy of my statement, and, without testing the experiment, advises me to try it again with other coils. He thinks I have a *metallic* connection, or, in other words a "cross." I have yet to learn that silk is a metal.

The particular experiment I made, when repeated by very experienced hands, may fail. Whether this be so or not, and whether the statement I made in reference to the subject be regarded as admissible, must be left to the judgment of each reader who *thinks* upon the subject.

The assertion of the fact upon my part does not make it so.

In order, however, that no one may labor under any delusion, I will state distinctly what, to my mind, is a self-evident fact, and of which I will, in due course of time, furnish ample proof.

First. That if a force be transmitted upon a wire of a certain size and length, a portion of that force can be made to manifest itself upon a second wire.

Second. That this force manifested upon the second wire will *not be momentary*, but will continue as long as the primary force is in existence.

Third. That these two wires need not be formed into a coil or coils, but be placed parallel to each other, and *not in metallic* connection.

Fourth. That the *only* coil to be used shall be a galvanometer, for the purpose of observing the deflections of the needle.

I do not deny that secondary, tertiary and quaternary forces are not obtained in the manner as laid down by Faraday, Henry and others.

It does not follow, however, that because they employed certain instruments, and obtained *momentary* effects, that it is beyond human ingenuity to devise plans and instruments that will indicate *continuous* results as stated.

All the forces, from the secondary up to the seventh order, have been found to vary in *intensity* and quantity, and it is owing to these *variations* which has rendered the investigation of the so-called laws of such forces complicated and difficult.

Respectfully,

M. V. B. BUELL.

## Frictional Electricity Excited by the Air.

PHILADELPHIA, March 7th, 1868.

To the Editor Journal of the Telegraph:

SIR—The extraordinary nature of the phenomena recited under the above caption in your last number, induces me to request that your correspondent will furnish some additional information on the subject. To properly comprehend the cause of such an excessive disturbance of the wires, there should be known the state of the weather immediately preceding and succeeding the phenomena; that is to say, whether it was clear or cloudy, dry or damp, rainy or snowy, the temperature, &c. It would also be interesting to know whether the line had, at any previous period, been affected by any other free electricity than the ordinary discharge of lightning, common to all lines in the warm months.

Although the duration of the disturbance is given, your correspondent unfortunately neglected the date. During the past month, February, the planets Jupiter and Venus steadily and rapidly approached each other, until, on the 27th ultimo, they were within twenty-three minutes of one degree. It was expected and announced that this conjunction of two such immense masses would have some sensible effect upon our world, in the form of gales of wind, magnetic

storms, etc.; and a correspondent (of ENGINEERING, I think,) suggested that it would be a favorable opportunity for observations upon the electrical disturbance of telegraphic wires.

In the absence of any information as to the day upon which the disturbance mentioned in your paper took place, it would be premature to announce that it was due to the celestial phenomena spoken of; but it is not too soon to say that the theory advanced by your correspondent is wholly untenable. The friction of air upon iron does not produce *electricity* but *heat*. In the hydro-electric machine, from which your correspondent probably derived his idea, the electricity is generated by the rubbing of *water* not against *iron* but boxwood, the vapor of water or steam merely supplying the power. By suddenly driving the piston into a syringe, or in any other manner compressing air rapidly, your correspondent will be convinced of this fact. Again, the effects produced by the extra current denoted a *quantity* rather than an intensity charge.

The parallelism of the wind and wire would be the most unfavorable position to develop excessive friction.

Finally, the fact that the Aurora produces generally but fitful currents cannot be used as an argument in such a totally unparalleled case as the present.

I would respectfully suggest that any operator who may have noticed any unusual disturbance on his line, during the past month, communicate to the JOURNAL an account of it. Respectfully, T.

CANTON, Miss., March 7, 1868.

To the Editor Journal of the Telegraph:

We cannot but notice that operators are becoming every day more and more inclined to vice and dissipation.

That Telegraphic pursuits tend to this as some seem to think, is preposterous; but that it is owing to separate and distinct causes, cannot be denied.

Telegraphers, from being changed so often, and having to make new acquaintances at every place they go, become wearied of such up-hill work, and naturally seek that society which is easiest to enter. There is a class of men in every town, more or less loose in their habits, who are always ready and eager for any accession to their numbers. Operators too frequently accept such as their companions.

And then, we think that the scanty and inferior furniture of some telegraph offices offers but little inducement to operators to remain in them; for, on the same principle that a cheerful and ornamented home tends to render young men contented, and to improve their morals, would a neatly furnished office render operators pleased with their situations and averse to immorality.

The first of these evils could, to a great extent, be alleviated by the operators themselves.

All operators spend much money foolishly, especially those who tolerate loose and frivolous companions. Now, if this amount was applied to the purchase of good solid books, and to articles, many of which are quite inexpensive but very cheerful in an office, and which he could take with him wherever he went, he would never experience a dearth of cheerful companionship, telegraphing would be rendered more and more pleasant, giving him respect for a "profession" irreproachable in itself, but rendered questionable by unthinking operators, blind to their own interest.

We should cultivate a spirit of fraternity, discourage vice and dissipation by our own examples; and the fruits would soon be seen in the cordiality with which good men received, and spoke of us, and in the silent approval of our own consciences—a good work well done. D.

FREDERICK, Md., March 12, 1868.

To the Editor Journal of the Telegraph:

As you have kindly invited correspondence, I write you. One thing alarms me. You say, "corre-

spondence, brief, practical, sketchy, sensible, will be received gladly."

You remind me of the lady who advertised for a girl; wanted one fresh from the "ould sod" who could wash, iron, cook, run a sewing machine, nurse the baby, and give the children sound moral instruction.

I can't fulfill all your conditions, but will try and keep to the first.

"*Apropos des dots*," does not Prof. Morse take up friend Varley rather hastily in your No. 7? It seems to me, after reading Mr. Varley's letter carefully, he only asserts that the *improvement of doing away with the spaced letters in the Morse alphabet* is due to the Germans; whereas, the Professor seems to blame him for crediting them with the *invention* of the Morse alphabet.

Your article in No. 7 on "Interpreting Telegraph Rules" put me in mind of another thing which most operators are in the habit of doing, without thinking of the consequences which *may* result; that is, writing out a message for another party, and *signing their name to it*, at their request.

To show the danger of it: I once wrote such a message for a man, ordering some small article, and the merchant duly forwarded it by express. The party ordering in the meantime changed his *mind*, and would not take it (he was one of the kind you can draw through an inch and a quarter auger hole if you took his boots off), saying he was not legally responsible, "as he did not write or sign the message!" I had the package returned, and paid the expressage, and considered *that* experience cheaply bought.

*Moral*.—If you write a message for another party, make *him* (beg pardon, ladies, or *her*) sign it.

I must tell you here of a little laugh I had, "all alone to myself," the other day. A domestic Fenian lady came to my office, with a letter neatly wafered and stamped with a dirty thimble, requesting me to "Send this by tellygraft to Harrpur's Firry, sure." I took it, ran my finger through the seal, and having opened it, was going to read it, when the old lady, with a countenance expressing a struggle between righteous indignation and holy horror at my audacity, exclaimed: "And what furr are ye after raydin me letther furr?" Having duly explained the matter to her, in a short discourse on the science (with a slight digression on static induction and Ohm's theory), she put out her hand for her "letther," saying: "Faith, I'll jist send it by the post office." I gave her the letter and "let her went." G. S.

LA GRANGE, KY., March 13, 1868.

D. R. Downer, Secretary.

DEAR SIR—I am indeed happy to give you my name and aid in the noble cause you represent. Surely the "*Telegraphers' Mutual Life Association*" is a corporation much needed by operators, and is being needed more and more every day as our pleasant science advances.

How much easier an operator (who has some *one* or several depending upon him for food and raiment) can rest when he knows that should Providence at any day take him away, his mourners will be comforted by his prudence and forethought in preparing for the awful end.

I earnestly hope that every operator, who can be admitted, will see the importance of the association, and not hesitate to take advantage of its good membership. Although it is now a comparatively small institution it is the germ of a great one at some future day. Wishing you much success, I remain,

Yours truly,

C. G. FREEMAN.

SOME men are like cats. You may stroke the fur the right way for years, and hear nothing but purring. But accidentally tread on the tail, and all memory of former kindness is obliterated.

## A Question for Mr. Varley.

To the Journal of the Telegraph:

When a world-renowned physicist undertakes to instruct us in Science, why does he not give us modern doctrines—especially if there are any improvement upon those taught many years ago?

In his letter of January 29th, Mr. Varley explains the chemistry of Daniells' battery on a hypotheses at least twenty years old, and which is now laid aside by the best chemists of his country. According to MILLER, HOFFMAN, ROSCOE, WILLIAMSON and others, neither hydrogen nor sulphuric acid play any part in the performances going on in this battery as now constructed. Sulphuric acid is not, as he says,  $\text{SO}^3$  but  $\text{H}^2\text{SS}^4$ —a compound of the former with the elements of water ( $\text{H}^2\text{G}$ ). Nor is sulphate of copper a compound of sulphuric acid and the oxide of copper, but one in which an atom of copper is combined with the  $\text{SO}^4$  in place of  $\text{H}^2$ . So sulphate of zinc is zinc and  $\text{SO}^4$ .

Let us now look at the resemblances which these several compounds have—

$\text{H}^2\text{SO}^4$  = Sulphate of Hydrogen (sulphuric acid).  
 $\text{Cu SO}^4$  = " " Copper.  
 $\text{Zn SO}^4$  = " " Zinc.

If we construct a battery of zinc, copper and sulphuric acid, on closing the circuit,  $\text{H}^2\text{SO}^4$  is decomposed,  $\text{H}^2$  appearing at the copper and  $\text{SO}^4$  at the zinc, combining with it and forming sulphate of zinc ( $\text{Zn SO}^4$ ).

If now we remove the copper plate, wipe off the hydrogen, and replace it inclosed in a porous bag or cup filled with a solution of sulphate of copper, the same action takes place throughout, except that in place of hydrogen, copper appears at the negative plate.

Allowing the circuit to remain closed after all the sulphate of copper is used up, action still goes on the same as before, but now comes a deposit of zinc, instead of either hydrogen or copper. Mr. Varley seems to dispute this, but I have seen it many times occur, under favorable circumstances. Zinc is deposited until the copper surface is coated over with zinc, then, zinc being opposed to zinc, action ceases.

Let us contrast the action as explained by the two theories.

Ancient Theory.	Modern Theory.
"On closing the circuit X X X X X, a change takes place in the solutions—the zinc, having more affinity for the oxygen than the copper, takes it from it leaving metallic copper, sulphuric acid and oxide of zinc, which two latter combine, forming sulphate of zinc."	"On closing the circuit, a change takes place in the solutions—the zinc, having more affinity for the sulphurion ( $\text{SO}^4$ ) than the copper, takes it from it, leaving metallic copper and sulphate of zinc."

Which is the simpler operation?

MODERN CHEMISTRY.

CHICAGO, March, 1868.

## Heat Generated by Electric Discharges.

A paper recently read at the Berlin Academy by Poggendorf, contains the following deductions from experiments made by the author:

1. The direct discharges of the machine are hotter at the positive than at the negative pole.

2. The temperature between the poles varies with the form of the electrodes. If the electrodes are spherical, the temperature is within certain limits—directly as the diameter of the sphere.

3. The elevation of the temperature between the electrodes depends on their nature. Under like conditions, the more volatile the metal forming the electrode, the higher is the temperature produced.

We have given a large portion of the present number to correspondents, to the exclusion of valuable matter. Some have still to wait.

## Telegraphic.

We notice by the telegraph journals that the question of fast telegraphing is being revived and several tests of "receiving" and sending have been made over the Western Union Company's lines within the past three weeks, the most remarkable of which, perhaps, was that of Mr. N. Snyder, of Philadelphia, who received twenty-five hundred and twenty words of reporting in one hour, "without a break;" his copy, which was in manifold, being very legible. This certainly was a very creditable performance on the part of Mr. Snyder, and deserves special mention. In this connection we will mention an extraordinary feat in the way of receiving Press reports, which, we believe, has never before been made public, and is not therefore generally known. Mr. P. H. Burns, well known as the holder of the "Champion Key," while night operator in the Spring of 1865, made a wager with a brother operator that he could receive "Report" two weeks without being compelled to "break." Mr. Burns not only succeeded in receiving the report without a break, for the stipulated two weeks, but followed it up by receiving the regular night report for fourteen months without once being obliged to "break" or have New York "go back and repeat over," on account of being unable to read words while passing through.

This may seem impossible to many, but we have good authority as to the truth of the statement, and Mr. Burns' telegraph friends claim that if necessary it can be substantiated by the testimony of the operators in the New York office who worked the Eastern press wires during the time in question.—*Worcester Evening Gazette*.

WANTED—A SITUATION IN A TELEGRAPH OFFICE BY a first-class Paper Operator.

Address, Box 176, Warren, Pa.

To the Editor Journal of the Telegraph:

The following shows the necessity of a change in some of the letters of the Morse alphabet:

In the morning press report of the 13th instant was an item from Ottawa, Canada, dated 12th. In this item is a paragraph beginning "Reported that Licenses," &c. The operating receiving the same translated it "Reported that Lyons, &c." In telegraphic characters they stand exactly the same.

Lyons, &c.

Licenses.

In the modified alphabet of Europe this could not have occurred.

The operator acknowledges he could not see the sense of the paragraph, but as it came plain, he did not ask repetition.

To the Editor Journal of the Telegraph:

I have learned since my arrival here, of a very flattering compliment which was paid to the gentlemanly manager of the Western Union Telegraph Office in this city, Mr. Jas. Schell, Jr., by the citizens of Binghamton. A short time since a church fair and festival was held here, and one of the principal features was that of an election for a handsome clock, which was put up by the ladies to be balloted for, they selecting two young men, viz., Mr. Schell and Mr. Doyle, as candidates, the one receiving the highest number of votes to take the clock (each vote being ten cents). The balloting continued each night for one week, during which time there was cast 9050 votes, Mr. Schell receiving 4711, Dr. Doyle 4339, giving Mr. S. a majority of 372, and realizing for the church the extraordinary sum of nine hundred and five dollars. The original cost of the clock was about fifty dollars. Very respectfully,

BINGHAMTON, N. Y., March 25th, 1868.

## Personals.

C. Clay Yeakle, operator Western Union Telegraph Office, Philadelphia, has resigned.

John E. Cardwell, formerly of W. U. Co.'s Wilmington, Delaware, office, has been transferred to Philadelphia to fill the vacancy occasioned by the resignation of Mr. Yeakes.

James Carley has been appointed receiving clerk. *vice* Carson, resigned.

William B. Gill has been appointed assistant receiving clerk, *vice* James Carley, promoted. Mr. Gill will continue to discharge the duties of the commercial news department.

Miss F. A. M. Eyster, formerly of the York, Penn., office, has been transferred to the Western Union Company's new office, Altoona, Penn.

M. J. McSorley, operator, died at his mother's residence, this city, yesterday (March 23). Mr. McSorley held the position of operator at the Philadelphia office of the American Company for several years, served some time at Port Hood, and latterly at Washington in the Franklin Company's office.

Abraham Scott, for so many years battery man for the "Magnetic," "American" and "Western Union" Companies, has been relieved, and Arthur Potter appointed in his place. "Abe" has been a general favorite with all of us, and on his retirement the operators and clerks of this (Philadelphia) office made up a purse of fifty (\$50) dollars, and presented it to him, much to the old man's surprise and gratification.

K. D. Walker took charge of the Fairmont, West Virginia, office (Western Union Line), on the 14th of March, *vice* W. W. Campbell.

## Very Dutch.

Peru, Ill., sends the following very rich specimen, being a message actually left at that office for transmission:

To Mr. Ad—:

Val ju send mir no guts el veht form.

AARON —.

Which, being translated, means:

Why you send me no goods, I wait for them!

The combination of the last two words is especially happy and is a decidedly new style of "packing" messages, which we commend to the attention of our friend Stoker. We hope Aaron has received his "guts."

## To Correspondents.

Our good friends who write us now and then, and whose articles appear in the JOURNAL, must pardon us if they occasionally find them abbreviated or changed. Sometimes we are compelled to omit half a dozen lines of good reading to squeeze the article into its proper place; sometimes an unintentionally harsh expression has to be softened; sometimes a good letter has been made too long and weakened by an unnecessary preface or appendix. We desire to have every communication look and read well, and as we are nurse, our friends must let us occasionally arrange the children's dresses. Don't get offended. No change will be made which will alter the sense, or give cause for offense.

GUTTA-PERCHA may be made capable of resisting a high temperature by dipping it for a moment in sulphuric acid at 60°, and then washing it in water. An immersion of a few seconds is sufficient for pure gutta-percha, but if it contains asphaltum or india-rubber the operation lasts longer, extending to even a few minutes.

HOW TO STOP THE FLOW OF BLOOD.—It is not generally known that the blood, even from severe cuts, may be staunched by binding on the wound the fine dust of tea. After the flow has been staunched, laudanum may be applied with advantage.

# Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 5,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

## TERMS:

One Dollar per annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID,  
145 Broadway, New York.

NEW YORK, APRIL 1, 1868.

## Effect of Cold on Insulation.

It is well known that nowhere is it more difficult to secure proper insulation and freedom from contact with disturbing and obstructing causes than in large seaboard cities. The multiplicity of wires, the humid air, the wet contact, aided by innumerable strings and kite tails over which disconsolate gamins have wept and raged, the dirtying processes of salt and soot deposits on and in insulators of whatever form, all combine to make the insulation in large cities a difficult and perplexing problem, which we fear nothing but underground lines will perfectly solve.

We deem it necessary to say this much before introducing one of the tests made by Mr. Varley, showing the effect of cold in the reduction of resistance to the current as compared with the same wires during the prevalence of damp weather.

## EXTRACT FROM MR. VARLEY'S REPORT.

"The following tests were made at Harlem, each side, to ascertain the improvement due to the frost." The wet test had already been taken, but is not necessary to state, the whole appearing in the result of the frost test.

"No. 8 wire, in England, gives 12½ ohms at 60° Faht. = 15.5° centigrade. Iron improves in conductivity by reduction of temperature—approximately 1 per cent. for, 50° Faht.

American No. 8 iron wire is rather lighter than the English wire of the same number (I am informed), and allowing 13½ ohms at 60° Faht., its resistance at 32° will be approximately 18 ohms; at 0, will be approximately 12.2 ohms.

## TEST.

New York to Harlem—Distance 8¼ Miles.

No. of Line Wire.	Damp Test in Ohms.	Frost Test in Ohms.	Ratio of Improvement.
2	7,750	290,000	87 per cent.
5		650,000	
7	20,200	600,000	30 "
8		600,000	
10	55,000	1,000,000	18 "
18	34,750	640,000	18.4 "
27	20,000	340,000	17 "
28	24,500	300,000	33 "
3	6,800	323,000	51 "
9	49,700	613,000	12.3 "

NOTE BY ED.—The difference of relative improvement is explainable by the different conditions of the wires, their relative freedom from obstructions, and different insulation. To the merit of insulators we do not now propose to refer. The test embraces the most approved forms. Experienced men will also remember that wires which have been often broken, especially where, as in a city, rust is so apt to supervene between the layers of the joints, wet weather much improves their conductivity, and so far reduces the resistance as to materially aid the insulation by lessening the tendency to escape. The term ohm is the name of the British unit used in measuring the power of electric currents, an ohm being the minimum degree.

## INSULATION IN CITIES.

Mr. Varley, in the recommendations with which he sums up his report, remarks as follows:

"The best and cheapest way of getting rid of your city troubles, is to lay down iron pipes from 145 Broadway to Fifteenth or Fifty-fifth Street, and carry all your wires underground to that point.

The insulating covering which answers best is "Hoopers" wire, which is a tremendously high insulator, and is not affected by dark temperature even up to 212° Faht.

"Next to this comes gutta-percha covered with tape and the tar mixture alluded to in the report (this we will give hereafter).

"The Electric and International Telegraph Co. has no overground wires in London, Liverpool, Manchester, Glasgow, Edinburgh, Newcastle, &c. We have overground wires in Dublin city, and find the cost of keeping them in any sort of order, greater than that of the underground wires, which give almost no trouble.

"The next best thing is to insulate your wires in the following manner, so that the rain itself shall keep them in order.

"Cover a piece of No. 8 wire, which has been galvanized and then tinned, with hard rubber, in the following form:

Insert one of these at each arm and solder the joints. The length of these should be seven feet, covered portion, five feet.

"The above insulator may be considered a double conductor, the electricity running over the surface from each end. The rain washes the insulator every time it falls, and improves it by washing, because the insulator is constructed to work while saturated with water.

"I have used these insulators since 1861 on the east coast of England, and north coast of Wales, where the wires are close to the sea, and the salt deposit defied all other forms of ordinary insulation, and found them to answer admirably. They insulate better than all other forms."

We must defer further quotations to another number, and also the remarks of Mr. Varley thereon, which aid the illustration of the subject on hand.

## Telegraphic Profanity.

In the correspondence to which we have been introduced by our new duties, no portion of it is so pleasant to us as that which once more draws us into intercourse with the associates of our early telegraphic labors. Few now understand what were the toils, how many were the anxieties, how frequent the hardships connected with these early years. Yet these, in which we struggled together with heartiness and enthusiasm, had their compensations. Our salaries were small, but we were content. Our own first salary we took out in simple glory, and on this delightful remuneration labored 18 hours out of the 24, sometimes sleeping on the instrument table beside an ambitious editor who wanted the first sheets of the expected news. Often, in the midnight train, with lantern in hand, and all the paraphernalia of a repairer's kit slung across our shoulders, with Sam Zook, and Anson Stager, and James Lindsay as companions have we sallied out to mend a break so as to have the line all right by morning. The grassy bank on which we rested when our work was done was soft and grateful, and the loaf of bread and the bucket of milk on which we sometimes made our midday meal tasted sweeter to us than the most savory viands of the Fifth Avenue or St. Nicholas Hotels. These were days of joyous labor, although the superintendent's salary, when glory was changed to gold, was not as much as that now given to a lady

operator, and some of whose aids rejoiced in salaries of \$300 a year.

But we forget. Here is a letter before us from John Campbell one of those early companions, now settled quietly and happily with his wife and children in the old town of Carlisle, Pa. Like some others, he is glad to be in communication with his old superintendent again. He writes us of times' changes, many for the better, a few for the worse. To one of the last of these he briefly refers, and which we use as a text for a few editorial words. It is in reference to occasional profanity over the wires, a thing forbidden by rule, always deemed harmful to the business, and, between distant parties, specially offensive and irritating.

If ever a business deserved and demanded refined intercourse among its co-laborers, it is the Telegraph. We would be glad to be the means of increasing it. The use of oaths between parties hundreds of miles apart is particularly mean, offensive and cowardly. Personal presence often does much to soften even the essential barbarity of an oath. We can see the kindness of the eye and the burning enthusiasm of the man, whose lips are tempted to savage use by some unworthy indignity and forgive it. There are men with whom we sometimes converse, whose natural vigor and impatience in the accomplishment of their high duties, lead them to the use of oaths, which round themselves in such impetuous vernacular, that we almost forget their ruggedness in admiration of the strength and enthusiasm which they represent. And yet we have wished that these same men could be made aware how much these interjected and unneeded expletives rob argument of its force, and strength of its serenity. The great forces of the world are silent. Calmness gives dignity to power. Oaths indicate lack of personal control, are an offense to good taste, and, in themselves, are absurd and degrading.

We take advantage of our growing venerableness to write thus paternally. We would be glad if we could induce every operator to refrain from an offence which is particularly hurtful in a business where mutual dependence in the performance of its duties is necessarily so great. "Swear not at all" is no less a religious duty than, on these wondrous means of intercourse, a business necessity. The telegraphic service demands patience, good-fellowship, frankness, generosity. To our mind, it demands far more. An oath thrust into the face of a distant fellow operator, over wires on which each letter has to be manipulated with all the coolness of malice, and by an agency so ressemblant of the Divine omniscience, should be met with expulsion so prompt as to forever prevent its repetition.

THE attacks of the *New York Herald* upon the Western Union Telegraph Company, so fierce, persistent and invindictive as to neutralize their power, have at last been met by such a statement of facts by the *Times* and *World*, as must fully satisfy the public desire for knowledge of the merit and animus of the onslaught. This paper has been silent respecting these assaults, because reply was, from this source, repugnant and unnecessary. The falsehoods were too numerous, the malice too striking, the vindictiveness too apparent, to permit any response without degradation. Any word said by us would have been attributed to the Executive officers around us. They needed and asked no defence. Even the *Times* and *World* would have remained passive witnesses of these daily brawlings of their noisy neighbor had the *Herald* not touched upon matters in which the New York Press and the Telegraph Company had so acted, as to render defense of a necessarily silent partner a matter of personal and public duty. In their hands we leave the controversy.

It is a noticeable fact that, during the period of these daily anathemas, the stock of the company maintained its former market value, and has now advanced two per cent.

**Official Statement—Western Union Telegraph Company.**

FEBRUARY, 1868.

Gross Receipts,	\$600,183.32
Expenses,	345,855.52
Net Profit,	\$254,327.80

**Notice.**CHECK AND FREE MESSAGE DEPARTMENT,  
Executive Office, March 27, 1868.

The resignation of Mr. George H. Smith, Superintendent of the Check and Free Message Department, having been accepted, that Department will on April 1st, proximo, be transferred to the control and supervision of the Auditor, Mr. W. H. Abel, whose instructions will be respected.

WM. ORTON, *President.***Superintendents Sweet and Wilson.**

In a biography of Judge John D. Caton recently published in the *Telegrapher*, the following appears, which we gladly transfer to our columns.

An illustration of the correctness of his judgment is shown in the cases of the two gentlemen employed by Judge Caton as Superintendents of the lines of the I. and M. Co.

Mr. E. D. L. Sweet first became connected with the I. and M. Co. in 1849, and has remained with it in all its changes until the lease of its lines to the Western Union Company, when he assumed the Superintendency of the consolidated lines at Chicago.

Mr. J. S. Wilson first became connected with the Company in 1847, and has remained faithful to its fortunes, and is retained as one of the Superintendents of the Consolidated lines.

Very much of Judge Caton's telegraphic success is due to the zeal and ability displayed by these gentlemen in seconding his plans, and carrying into effect the improvements which were originated and adopted to extricate the Company from the misfortunes which well nigh worked its destruction. Judge Caton always fully acknowledged his indebtedness to them, and has always manifested a sincere interest in their welfare and prosperity, which, on their part, is fully reciprocated.

A WEEK ago the *Telegrapher* exposed telegraph operators as an unintelligent fraternity. In the present number of our own paper, our Canton, Miss., correspondent alludes to a certain tendency to vice among operators, which he regards, however, as not necessarily an outgrowth of the system. To both of these we will hereafter refer, but cannot now. Evils and ignorance no doubt exist. We believe they are both on the wane. Taking this hive wherein 200 men daily work as an average of the standing of the craft elsewhere, we claim a growing intelligence and a higher *morale* than that of former years. Our work is to aid the increase of both.

**Self-closing Key.**

We have received from Mr. A. J. Gillespie, of Ashley, Illinois, a self-closing key of very decided merit and ingenuity. We would be glad to describe it fully, but in all such cases we desire the full permission of the inventor to do so. This device has a double finger plate, the upper one of which flies back the instant the finger of the operator is removed, and by doing so releases a stout spring which presses down the arm of the key and firmly closes it. A combination of this invention of Mr. Gillespie's with the excellent anti-trunnion key of Mr. Wm. A. Benton, of Macon, Ga., to which we referred in last number, would seem to supply all that is desirable in a key, and yet we have a plan of our own for closing keys which we in some respects prefer, because it does not interfere with the finger plate at all, but acts without interference, though it does not for a second or more close the circuit.

**TARIFF BUREAU.****Semi-Monthly Circular.**WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
April 1, 1868.

TO ALL OFFICES ON W. U. LINES:

Please note the following changes in your Tariff Book, which have occurred since the 15th March, the date of the last Tariff Order:

The following rates will be charged hereafter on through business from Louisville, Ky., and Washington, D. C., to the places named below:

Americus, Miss., tariff from Louisville,	
Ky., 235: from Washington, D. C.,	260
Athens, Ga.,	300
Bainbridge, Ga.,	350
Batesville, Ark.,	275
Beasley's Station, Ala.,	250
Blakely, Ala.,	250
Blue Mountain, Ala.,	250
Brickley, Miss.,	225
Camak, Ga.,	300
Charlotte, N. C.,	300
Chester, S. C.,	300
Clarendon, Ark.,	250
Columbiana, Ala.,	250
Company's Shops, N. C.,	300
Concord, N. C.,	300
Columbus, Ga.,	275
Covington, Ga.,	250
Durham, N. C.,	300
Evergreen, Ala.,	250
Forestville, N. C.,	300
Fort Valley, Ga.,	275
Franklin, N. C.,	300
Greenville, Ala.,	250
Greensboro, Ga.,	275
Henderson, N. C.,	300
High Point, N. C.,	300

WILLIAM ORTON,  
*President.***Errata in Monthly Circular—Journal No. 6.**

For offices closed on "other lines," Eastern Division, read *offices opened*.

Simeon E. Mayo.

Among recent changes, we notice the resignation of Mr. Mayo, circuit manager of the Western Union Telegraph Company at Albany, to accept the management of the telegraph line of the Susquehanna Railroad company, in connection with other railroad duties of a responsible character. For the past sixteen or twenty years, Mr. Mayo has been known as one of the most expert and useful men connected with our State lines, and, first as messenger, then as operator, and finally and for many years as manager, has always been trusted and honored. It is a good deal to be able to say, as Mr. Mayo truly says in a letter now before us, "I have worked sixteen years, have received and sent thousands of messages, and never made a mistake that cost the company one cent. Our own acquaintance with Mr. M. has been long and intimate. We have valued him highly and trusted him implicitly. His home will still be in Albany, and we wish him all the happiness he can bear, and entire success in his new duties.

**Singular Effects of Lightning.**

Sir David Brewster published an account of the effects of lightning in Forfarshire which is of much interest. In the summer of 1827, a haystack was struck by lightning. The stack was on fire, but before much of the hay was consumed the fire was extinguished by the farm servants. Upon examining the haystack, a circular passage was observed in the middle of it, as if it had been cut out with a sharp instrument. This circular passage extended to the bottom of the stack, and terminated in a hole in the ground. Captain Thomson, of Montrose, who had a farm in the neighborhood, examined the stack, and found in the hole a substance which he described as resembling lava. A portion of this substance was sent by Capt. Thomson to Sir David's brother, Dr. Brewster, of Craig, who forwarded it to Sir David, with the preceding statement. The substance found in the hole was a mass of silex obviously formed by the fusion of the silex in the hay. *Electric.*

TO U. S. TELEGRAPH CO. STOCKHOLDERS.—The undersigned will attend to the sale or exchange of United States Telegraph Co. Stock for actual shareholders, without commission. U. S. stock can be exchanged for stock of the Western Union Telegraph Co., three shares of the former for two of the latter, as per contract. Odd shares will be bought at market rates, i. e., two-thirds of the market price of stock of the Western Union Telegraph Company.

J. D. REID,  
Rm. Rooms W. U. Tel. Co.,  
145 Broadway, N. Y.**MARRIED.**

At Barton, Orleans County, Vt., March 23, 1868, by Rev. Church Tabor, George W. Howe of Western Union Telegraph Company, Stevenson, Ala., to Miss Dora E. Billings, of Barton, Vt.

## SPACE AND MATTER.

By one of the Telegraph Boys.

The infinity of space presents itself to the mind as a self-evident fact. Let any one imagine himself capable of leaving the earth in any direction and in a straight line with the velocity of a thousand miles per second, would there be an end or stopping place for want of further extension of space? No; he might travel at that speed for millions of ages and be no nearer his journey's end than at the start; in fact would not have made a point in infinite space. The above I think is self-evident.

Taking it for granted that space extends to infinity in every direction, the next point to entertain is, whether this infinite space is wholly or in part occupied by matter, and whether we shall grant the same infinity to matter, that we have to space. That proposition is not so readily answered, for one of our most acute perceptions of matter is the comparative limit of its extent as presented to our senses. Logically it may be demonstrated that all space is occupied, and that matter is as infinite as space; for empty space is a nonentity, ideas are based upon matter, and to remove matter is to remove the "basis of an idea," which at once prevents us from such an admission.

Let us regard the universe as it presents itself to our senses, or that part of it which the range of our vision, assisted by the most powerful instruments (which of course largely extend our acquaintance), we are made aware of the existence of those blazing orbs by the light which they radiate to us, and which of course must pass through the intervening space or matter. That positive science, mathematics, gives us some idea of their immense distance, and of the planets an accurate knowledge; had we instruments of proper delicacy, and perceptions sufficiently acute, we might make some positive statements as to the distance of the fixed stars, if in the case of one of them (61 Cygni), a parallax of  $\frac{1}{4}$  of a second has really been obtained as is stated, then it must be at least 20,000,000,000,000 miles distant, a distance so great that sound travelling at the rate of eleven hundred feet in a second would require more than seventeen millions of years to reach it and Arcturus, a burning sun, in bulk thirteen million times greater than our world.

To comment upon the distant Astral systems which the telescope allows us to contemplate in the immensity of space, would be too much of a digression from my subject. But the new science Spectrum Analysis informs us that these distant apparitions are material, and contain elements of matter identical with those composing our earth. With the Spectroscope the chemist and astronomer now wander hand in hand through the universe analyzing the chemical and physical condition and nature of these distant worlds, many of which are found to be in a state of intense ignition.

If light is matter, then all interplanetary and stellar space is occupied; if it is not a substance but simply a force, vibration, or undulation, still is space occupied for it must include matter to transmit this force or undulation, for these vibrations of the physical forces, Light, Heat, Electricity and Chemical action, as well as attraction, if not material must be merely qualities of matter, in other words, a mechanical oscillation or vibration of the atom. The latter theory I believe is recognized by nearly all eminent Physicists of the present day. We must then conclude that matter is infinite, and that all space is occupied. As well as light we may mention other forces which pervade the universe, as heat and the force of universal attraction so admirably demonstrated by Newton, that force which determines the position of all the heavenly bodies. How can we conceive of one body taking cognizance of another with empty space intervening? As a friend sug-

gestively remarked, "it is difficult to conceive of pulling without a string to pull by." The great strides which are being made in Scientific discovery and knowledge forcibly presents to us the progressive tendency of the human mind. This human progression may be as infinite and unlimited as the matter and force which develops it. H. L. B.

POUILLET has made observations with a pyrheliometer from which he estimates that the amount of heat annually received by the earth from the sun would melt a crust of ice surrounding the earth 101 feet thick.

## A Story from Paris.

A Paris letter tells the following story of a Twelfth Night *fete* in that city: A wealthy family in the aristocratic boulevard Malesherbes were amusing themselves in seeking the King's portion, or the ring in the festival cake, when a lady of the company says to the hostess:

"I wish my portion to be given to the poorest little boy we can find in the street."

The servant was dispatched on this freezing night, and not far from the house he found a ragged urchin, trembling with cold and hunger. He brought him up, was ordered into the saloon, where a thousand lights glittered, and a sparkling fire gladdened and surprised him. He drew his portion which the benevolent lady had promised, and as luck would have it, the little fellow found the "ring" (beans they use in Paris instead), and, of course, he was "King." They all shouted out that, being a King he must choose a Queen. He was asked so to do, and, looking round the company, he chose the very lady who had proposed to cede her portion of cake. He was asked why he chose her. He said:

"I don't know! she looks the most like mother!"

"Mother! whose mother?"

"My mother! I never knew her, but was stolen away from her, and here is her portrait!"

With this he drew from out his ragged coat a likeness, which proved to be that of the very lady herself, who, in Italy, had her child stolen from her, and now he turns up a poor little ragged Savoyard, dragging along a miserable existence in Paris, while his mother, by an intuition, perhaps, felt that in the air near to where she was one so dear to her.

## Glycerin and Yolk of Eggs.

Four parts by weight, of yolk of egg rubbed in a mortar with five parts of glycerin, according to the Philadelphia *Journal of Pharmacy*, gives a preparation of great value as an unguent for application to broken surfaces of the skin of all kinds. The compound has a horny-like consistency, in unctuous fatty substances, but over which it has the advantage of being quickly removed by water. It is unalterable, a specimen having laid exposed to the air for three years unchanged. Applied to the skin it forms a varnish which effectually excludes the air, and prevents its irritating effects. These properties render it serviceable for erysipelas and cutaneous affections, of which it allays the action.

ABERNETHY once said to a rich but dirty patient, who consulted him about an eruption: "Let your servant bring to you three or four pails of water and put it into a wash tub: take off your clothes, get into it and rub yourself well with soap and a rough towel, and you'll recover." This advice seems very much like telling me to wash myself," said the patient. "Well, said Abernethy, "it may be open to that objection."

## To Preserve Fresh Flowers.

Put a pinch of nitrate of soda into the water every day when you change it. This will preserve flowers for a fortnight. Nitrate of potash in powder has nearly the same effect.

## MACHINE SHOPS.

George M. Phelps, *Superintendent, Williamsburg, N. Y.*George W. Shawk, *Superintendent, Cleveland, O.*Robert Henning, *Superintendent, Ottawa, Ill.*W. H. Johnson, *Superintendent, Louisville, Ky.*

**Love and Lightning.**

A lady once whose love was sold,  
 Asked if a reason could be told  
 Why wedding rings were made of gold.  
 I ventured thus to instruct her:

Love and lightning are the same—  
 On earth they glance, from Heaven they came:  
 Love is the soul's electric flame,  
 And gold its best conductor.

**Necessary Rules of Sleep.**

Dr. Winslow wisely says there is no fact more clearly established in the physiology of man than this, that the brain expends its energies and itself during the hours of wakefulness, and that these are recuperated during sleep. If the recuperation does not equal the expenditure, the brain withers—this is insanity. Thus it is that, in early English history, persons who were condemned to death by being prevented from sleeping, always died raving maniacs; thus it is also that those who are starved to death become insane—the brain is not nourished, and they cannot sleep. The practical inferences are three: 1st. Those who think most, who do most brain work, require most sleep. 2d. That time "saved" from necessary sleep is infallibly destructive to mind, body, and estate. Give yourself, your children, your servants—give all that are under you, the fullest amount of sleep they will take, by compelling them to go to bed at some regular hour, and to rise in the morning the moment they awake; and within a fortnight, Nature, with almost the regularity of the rising sun, will unloose the bonds of sleep the moment enough repose has been secured for the wants of the system. This is the only safe and sufficient rule; and as to the question how much sleep any one requires, each must be a rule for himself—great Nature will never fail to write it out to the observer under the regulations just given.

**An Eloquent Passage.**

"It can not be that earth is man's only abiding-place. It can not be that our life is a bubble cast up by the ocean of eternity to float a moment upon its waves, and sink into nothingness. Else, why these high and glorious aspirations which leap like angels from the temple of our hearts, forever wandering unsatisfied? Why is it that the rainbow and cloud come over us with a beauty that is not of earth, and then pass off to leave us to muse on their loveliness? Why is it that the stars which hold their festival around the midnight throne, are set above the grasp of our limited faculties, forever mocking us with their unapproachable glory? And finally, why is it that the bright forms of human beauty are presented to our view and taken from us, leaving the thousand streams of our affections to flow back in Alpine torrents upon our hearts? We were born for a higher destiny than earth. There is a realm where the rainbow never fades, where stars will be spread out before us like the islands that slumber on the ocean, and where the beautiful beings that pass before us like shadows, will stay forever in our presence."—  
*G. W. Prentice.*

A DISPATCH to a gentleman in this city, says that the Cable Banquet in London was a gratifying success. The replies from America and Cuba to telegrams sent from the dinner table, were received in an average of about one hour from the time of sending the message, or thirty minutes each way. Those from the President and Secretary of State, the Governor-General of Cuba, and Vice-President Nenninger of the International Ocean Telegraph Company, Messrs. Cooper, Orton, Smith, and Sanford, were read and received with enthusiasm.

In 1867, nearly 5,000,000 telegrams passed through the various telegraph stations in Great Britain.

**Telegraphers'****Mutual Life Insurance Association.**

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

- I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.
- II. Its officers shall consist of a Treasurer and Secretary.
- III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.
- IV. No officer shall, at present, receive any remuneration for his services.
- V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.
- VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.
- VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.
- VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.
- IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.
- X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.
- XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.
- XII. Special meetings of the association may be called upon the written request of twenty-five members.
- XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.
- XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.
- XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.
- XVI. The books of the association shall always be open for examination by any member thereof.

J. D. REID, Treasurer.

D. R. DOWNER, Secretary.  
 W. O. LEWIS,  
 A. S. BROWN,  
 W. H. HILL.

Executive Committee.

**DIRECTIONS TO APPLICANTS.**

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.
2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.
3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.
4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.
5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

CHARLES WILLIAMS, JR.,

**L. G. TILLOTSON & Co.,**

26 DEY STREET, NEW YORK,

MANUFACTURERS OF  
TELEGRAPH INSTRUMENTS

AND

MATERIALS OF EVERY DESCRIPTION.

We invite all Telegraphers to a close inspection of our Work.

WE ARE PREPARED TO CONTRACT FOR THE ENTIRE  
CONSTRUCTION OR EQUIPMENT OF TELEGRAPH  
LINES OF ANY EXTENT DESIRED.

OUR WORK WILL BE DONE PROMPTLY,

And it is particularly requested that any goods sold and recommended by us, not proving satisfactory, SHALL BE RETURNED.

We have on hand an assortment of other makers' Instruments besides our own, and are prepared to supply them at their own prices—

BRADLEY'S,

CLARK'S

HALL'S

WILLIAMS'

Or any other, excepting such as we know to be of inferior quality.

OGDEN'S IMPROVED CARBONS

WITH THE

IMMERSED PLATINUM CONNECTION,

Make, beyond question, the most perfect Battery yet produced. We have abundant testimony of their GREAT SUPERIORITY OVER ANY OTHER.

We particularly invite attention to our whole arrangement of the

CARBON BATTERY,

Proving, as it does, that as much strength may be obtained from this Battery as the Grove, with far less expense.

**DR. L. BRADLEY,**

NO. 7 EXCHANGE PLACE, JERSEY CITY, N. J.,

Keeps constantly on hand and for sale his

IMPROVED TELEGRAPH INSTRUMENTS,

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed. His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them.

Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

## PRICES.

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	18 00
Main Sounders same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	4 50 to 6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package.

He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers prices.

## INDUCTION RELAY.

Patented by Elisha Gray, Cleveland, Ohio.

A novel and effectual mode of operating a relay has just been patented by Elisha Gray, of Cleveland, O., which embodies a principle that necessarily renders it non-adjusting.

The accompanying diagram will assist the reader in getting a clear understanding of its *modus operandi*:

M and M' are two small relay magnets, made in the ordinary way, and connected with the main line by the wires L, L and to each other by the wire A in such a manner that their polarity will be opposite when facing each other. Between and in contact with the poles of the magnets M, M' are placed two straight electro magnets, or electro-magnetic armatures D, D. These are wound with insulated coarse wires which are connected together by their inner ends, while their outer connect with the small electro-magnet C by the wires S, S, forming a closed local circuit, entirely independent of, and insulated from the main line. B is a straight steel armature, pivoted in the middle and permanently magnetized, one end of which vibrates between the poles of the electro-magnet C, the other between screw points which prevent it from striking the poles of the electro-magnet, and also regulate the length of the stroke. This armature has no spring and will not rest on either screw point when placed there, so long as the electro magnet is neutral, which is always the case except at the moment of opening, and again at the closing of the key in the main circuit.

Having described the different parts with their connections, it only remains to illustrate the principle involved and make a practical application. The instrument is connected with the main circuit as described by wires L, L, and is operated with the ordinary key. It will be observed that the line current does not pass through the electro-magnet C, which controls the armature, but only through the magnets M M. Now suppose the line to be closed, the cores of the magnets M, M are rendered magnetic by the power of the current, and the cores of the straight magnets D, D by induction. The armature B is resting on the forward point, whither it was thrown by a momentary wave of induced electricity. This wave has passed through the magnet C, giving it temporary polarity, one pole of which has attracted the magnetized armature, while the other has repelled it, and thus all the powers, both of the electro and permanent magnets have conspired to move the armature in the same direction. Now if any operator on the line should open his key and break the current or any portion of it, there would be a sudden reduction of magnetism in M, M & D, D which will produce a momentary wave in the opposite direction from that produced at the closing of the key; this of course will produce an opposite polarity in the magnet C, and a reverse stroke of the armature. And thus it will be seen that as often as the line current is closed an induced current will flow in one direction, and as often as it is opened it will flow in the opposite direction.

Now if the armature is adjusted so as to respond to feeble currents, such as would be produced by

the working of the most distant key over heavy escapes, it is plain that it will work for any other key on the line on the same adjustment, because the initial and terminal wave of the induced electricity in the coils D D are practically equal. If one is suddenly increased the other is proportionately increased, and vice versa, in other words the flow and return are equal. The results obtained by this instrument do not depend upon any delicacy or arrangement of movable mechanism or complicated machinery, but utilizes an unfailing law of nature, and applies it by means of the simplest machinery.

Improvements in Automatic Telegraphy.

Since the 11th September, 1867, the directors of the telegraph lines have made use, in the service between Paris and Lyons, of a new system of rapid transmission invented by MM. Chaudassaignes and Lambrigot, telegraph clerks. This telegraph acts automatically, transmitting the despatches between the two towns at the rate of 120 or 180 despatches per hour by a single conducting wire, a velocity three times as great as that obtained by other systems, and capable of being augmented proportionately to the diameter of the wire. The transmissions are made by a band of metallic paper on which the signals composing the despatch are traced in insulating ink. The reproduction is obtained on a band of unsized paper, the centre portion of which is impregnated with a chemical liquor necessary for the formation of the characters existing on the metallic band. In order to obtain regularity of execution in the different operations, such as the composition, transmission, and reception, they pass through several hands according to the requirements.

One instrument in communication with the line is composed of—1. A clock-work movement. 2. A double roller which sets at work either the metallic or the chemically prepared paper. 3. A ringing apparatus for calling the attention of the correspondent. 4. A "Morse" manipulator of ordinary construction for the exchange of the conventional signs necessary for setting in movement or stopping the rollers. The clock-work movement is set at work by a weight easily wound up by means of a pedal; it serves to maintain the rollers in movement. Near the roller round which the metallic band passes, is a point which represents the extremity of a conducting wire. The roller communicates with the electric pile. When the band is drawn into movement by the rotation of the roller, the point is placed sometimes on

one of the metallic parts of the band, and sometimes on the written parts of the despatch where the isolating ink is, so that the conducting wire marks the message by the alternate passage, and breaking of the current. Near the roller, on which is coiled the unsized paper, is placed a cup filled with a solution of nitrate of ammonia and ferrocyanide of potassium. In the middle of this cup is a small roller which dips into the liquid in its lower portion, and the upper portion of which rises a little higher than the gessé of the basin and supports the band of unsized paper which, drawn by the rotation of the two rollers, turns the small dipping roller and becomes impregnated with the solution.

A point of iron representing, like that of the metallic band, the extremity of the conducting wire, leans, slightly inclined, resting by its own weight upon the damp paper which is in communication with the earth. The voltaic current decomposes the wet portion, and leaves a coloured deposit which represents the signals of the despatch. The working of this apparatus is entirely mechanical. The transmission and the reception of the despatches take place automatically; one clerk superintends the machine. In order to compose the despatches into conventional signals on the metallic band, another instrument, called the compositor is employed, similar to that of Morse, the signals of which are employed. The band of metallic paper unrolling itself is raised by a lever so as to touch a thick roller covered with a resinous preparation in fusion, which cools suddenly as soon as it is applied to the metallic band. One clerk can prepare alone 35 to 40 despatches per hour; the telegraphic staff acquainted with the Morse apparatus can, without any study, compose despatches. For the service between Paris and Lyons three compositors suffice completely for the transmissions. The despatches reproduced on a band of chemically prepared paper are handed over to other clerks, who translate them for the printed despatches distributed to the public.

The result is that two composing clerks, two translating clerks, and a superintendent of the machines of reception and transmission, do as much work by aid of a single conducting wire as six clerks with three wires by the ordinary telegraphic system. A composing apparatus furnished with electro-magnets has been established on a line from London to Paris. When the employe in London wishes to transmit a telegram to Paris for the Lyons line, the only line in which this rapid service is installed, he manipulates as for the ordinary transmissions of the Morse apparatus; the letters or conventional signs are printed on a metallic band, and a few seconds afterwards are transmitted to the chemically prepared paper. Thus we have before us a great improvement in modern telegraphy. Up to the 11th September last the service of the Lyons line was carried on by aid of two or three Hughes' apparatus; each apparatus occupies two clerks and three batteries. By the new system five clerks do all the service with one line only. The new system works admirably and without a single hitch, and we can affirm that the invention of MM. Chaudassaignes and Lambrigot is destined to render great service to the telegraphic service. The economy of installation, and the saving effected in the number of clerks, the maintenance, wear and tear, etc., are marvellous. — *Chemical News*.

## Correspondence.

## Batteries and their Composition.

PHILADELPHIA, April 4, 1868.

To the Editor Journal of the Telegraph:

SIR: As Mr. Varley himself began the discussion of this subject I trust he will not think discourteous what may be said in the matter after his return to England. When a gentleman of Mr. V.'s eminence in the profession propounds over his own name explanation of some phenomena, he must expect to have his views criticised more rigidly than would be the case were he less well known. Far be it from me, Mr. Editor, to *criticise* the letters of Mr. Varley as published in your issues of the 15th February and 16th March last; the purpose of my present communication is merely to point out a couple of oversights, which, by their omission solely, might confuse some of our "weaker brethren." The notices of discoveries of new substances for galvanic batteries, reduced, probably, from the minutes of some learned body, and translated and retranslated, with still further reduction, in subsequent publications, are seldom so full in detail as to warrant the passage of an immediate judgment upon their merits. I have no desire to defend the battery of M. Mannelli Giacomo; for, with the data given, I must admit with Mr. Varley that it would be far from an "improvement." It is, however, by no means certain but that M. Giacomo may not have found some means of preventing the reaction of the sulphuric acid liberated by the decomposition of the sulphate of zinc, by giving it other work to do. In this would consist the "improvement" possibly, and it would be premature to pronounce such an action an impossibility. A zinc-zinc battery—is by no means a new thing, having been employed by Sir Humphrey Davy in his earlier researches into the chemical theory of electricity, an account of which can be found in almost any book on the science. The side of a plate of zinc in a water bath was found to be negative to the other side exposed to the action of dilute sulphuric acid. These experiments on one-metal batteries were more elaborately examined by Becquerel. The most famous investigator of the subject is the present Emperor of the French, who, in 1843, being then in prison at Ham for his Bordeaux adventure, wrote Arago an account of his labors in a letter subsequently published in *Comptes Rendus*, vol. xvi., pp. 1180-1. The following extract may not be uninteresting in this connection:

"I made a second experiment with zinc alone. I poured into a porous tube, containing a rod of zinc, a mixture of water and sulphuric acid, and I surrounded this tube with another cylinder of zinc immersed in pure tepid water. With two similar couples I decomposed iodide of potassium, and I obtained, by taking the necessary precautions, a deposit of copper at the pile in connection with the zinc, attached as previously" (at the copper wire in the decomposition trough forming the cathode). "Finally, I reversed the usual order of the metals, and placed the copper into the centre of a vessel filled with water and nitric acid, and I surrounded the porous tube with a zinc cylinder immersed in pure water. I thus obtained a rather strong pile."

Finally, Dr. Wm. A. Miller, in summing up the requisites of galvanic couples, writes (*Elements of Chemistry*, Part I., pp. 386-7): "Any inequality in susceptibility to chemical action gives rise to a current between two substances suitably disposed; hence any difference in *density* between two pieces of the same metal may suffice to cause a current; and a piece of hammered zinc will generally act as a conducting plate to a piece of zinc well annealed."

I wish to call your attention to another point in Mr. Varley's letter, and that is the electrolytic action in the Daniell's battery. Mr. V. says: "The zinc having more affinity for the oxygen than the copper takes it from it," &c.; and again, in answer to the

question of Inventus, "Is there not an affinity between hydrogen and the sulphate of copper?" answers: "*This question does not arise in the Daniell's battery.*" How can Mr. Varley forget to mention that in the Daniell's battery the sulphate of copper does not come in contact with the zinc, and hence the latter cannot reduce it. The existence of this battery depends upon the porous diaphragm to keep separate the solutions; without it we should have the zinc sulphate decomposed at the negative plate and the metallic zinc deposited on the copper, and thus, both plates being zinc, and both in acid solutions, we should be in as unfortunate a condition as though the battery had been constructed according to the published account of poor M. Giacomo's pile. Certainly the question of Inventus *does* arise in the Daniell's battery. The salt of copper not being in contact with the zinc is not decomposed by it, but is reduced to metallic copper and sulphuric acid by nascent hydrogen, itself liberated from combination in water by the electro-chemical action of the zinc and by subsequent compositions and decompositions, through the porous cell, to the copper solution in the external cup. The affinities of bodies in a nascent state, that is at the time of their release from combination, are almost infinitely stronger and more active than at any subsequent period. Faraday is positive on this point. He says (*Experimental Researches*, 744): "When aqueous solutions of the metallic salts are decomposed by the current the metals evolved at the cathode, though elements, are *always*" (the italics are his) "secondary results, and not immediate consequences of the decomposing power of the electric current."

If Professor Grove asked Nature, "Can we not get the sum instead of the differences of the forces," he surely did not get a favorable answer, else he would never have employed nitric acid, which could be useful only as an oxidizing agent, similar to but not more powerful than the sulphate of copper, merely because it holds its last one or perhaps two atoms of oxygen with a very small force. In *principle* there is no difference between the batteries of Daniell and Grove; in *practice* there is a very great difference in the amount of work required by the hydrogen, in the one case the reduction of the neutral basic protoxide of copper, and in the other that of the infirm acid per-oxide of nitrogen. In neither the Grove nor the Daniell batteries is the *sum* of the forces obtained. Prof. Grove himself says (*Phil. Mag.*, vol. xv., p. 289): "In the common zinc and copper battery the resulting power is the affinity of the anion of the generating electrolyte for zinc minus its affinity for copper. In the common constant battery (Daniell's) it is the same affinity plus that of oxygen for hydrogen, minus that of oxygen for copper; in the combination in question (Grove's) the same order of positive affinities minus that of oxygen for azote. As nitric acid parts with its oxygen more readily than sulphate of copper, resistance is lessened and the power correlatively increased."

Respectfully, your obedient servant,

A TELEGRAPH OPERATOR.

## Who are Struck by Lightning?

One of that curious class of men, the statisticians, has taken the pains to ascertain the number of persons struck by lightning in several countries in Europe. In France the average number of persons struck each year is eighty-one out of a population of 38,000,000; in Germany, seventy-two out of 47,000,000; in Sweden, eleven out of 4,000,000; in Saxony, six out of 2,000,000. He ascertained also that the lightning is so ungallant as to strike more women every year than men.

Discharged for drunkenness on Central Division during March, 2; defaulter, discharged, 1.

We reprint the following to correct important errors which crept into it as published in our edition, and which we much regret.—Ed.

## A Question for Mr. Varley.

To the Journal of the Telegraph:

When a world-renowned physicist undertakes to instruct us in Science, why does he not give us modern doctrines—especially if there are any improvement upon those taught many years ago?

In his letter of January 29th, Mr. Varley explains the chemistry of Daniell's battery on a hypothesis at least twenty years old, and which is now laid to rest by the best chemists of his country. According to MILLER, HOFFMAN, ROSCOE, WILLIAMSON and others, neither hydrogen nor sulphuric acid plays a part in the performances going on in this battery as now constructed. Sulphuric acid is not, as he says,  $\text{SO}_3$  but  $\text{H}_2\text{SO}_4$ —a compound of the form with the elements of water ( $\text{H}_2\text{O}$ ). Nor is sulphate of copper a compound of sulphuric acid and the oxide of copper, but one in which an atom of copper is combined with the  $\text{SO}_4$  in place of  $\text{H}_2$ . The sulphate of zinc is zinc and  $\text{SO}_4$ .

Let us now look at the resemblances which these several compounds have—

$\text{H}_2\text{SO}_4$	= Sulphate of Hydrogen (sulphuric acid)
$\text{Cu SO}_4$	= " Copper.
$\text{Zn SO}_4$	= " Zinc.

If we construct a battery of zinc, copper and sulphuric acid, on closing the circuit,  $\text{H}_2\text{SO}_4$  is decomposed,  $\text{H}_2$  appearing at the copper and  $\text{SO}_4$  at the zinc, combining with it and forming sulphate of zinc ( $\text{Zn SO}_4$ ).

If now we remove the copper plate, wipe off the hydrogen, and replace it inclosed in a porous bag or cup filled with a solution of sulphate of copper, the same action takes place throughout, except that in place of hydrogen, copper appears at the negative plate.

Allowing the circuit to remain closed after all the sulphate of copper is used up, action still goes on the same as before, but now comes a deposit of zinc instead of either hydrogen or copper. Mr. Varley seems to dispute this, but I have seen it many times occur, under favorable circumstances. Zinc is deposited until the copper surface is coated over with zinc, then, zinc being opposed to zinc, action ceases.

Let us contrast the action as explained by the two theories.

## Ancient Theory.

"On closing the circuit \* \* \* a change takes place in the solutions—the zinc, having more affinity for the oxygen than the copper, takes it from it leaving metallic copper, sulphuric acid and oxide of zinc, which two latter combine, forming sulphate of zinc."

## Modern Theory.

"On closing the circuit, a change takes place in the solutions—the zinc, having more affinity for the sulphurion ( $\text{SO}_4$ ) than the copper, takes it from it, leaving metallic copper and sulphate of zinc."

Which is the simpler operation?

MODERN CHEMISTRY.

CHICAGO, March, 1868.

## Volta Electric Induction.

To the Editor Journal of the Telegraph:

SIR—If Mr. Buell succeeds "in due course of time" in furnishing proof of the theory he advocates none will feel a greater amount of pleasure than myself. I still, however, hold that his original experiment was deceptive, and the inferences he makes from it totally unwarranted. He must be very young if he supposes that writing over an initial indicative of a lack of "manliness."

Respectfully,

T.

Philadelphia, April 4, 1868.

## A Weather Science.

We are approaching the realization of a science of the weather. The telegraph is the instrument that is giving it to us. The science is one in which Teacher has no concern. He is exploded, and superseded by the new one which the electric wires have developed during the past winter. Throughout that season it has been possible to foretell nearly every important storm that has occurred. Many of them have been forecast with considerable accuracy. We may refer particularly to the snow storm which fell upon us last Saturday night. A few hours before, the telegraph had brought news of heavy snows in Wisconsin and Minnesota, Northern Illinois, etc. A few days before that same instrument reported a severe snow storm on the plains of the far West. The three storms were the same one in the different stages of its journey to the Atlantic coast. Those who had observed the progress of previous storms were ready to predict, before a flake of snow had fallen, that we would have a snow storm. The same succession and progress of storms has been observed several times before during the winter, and, less extensively, in previous winters. It seems satisfactorily established that our heaviest storms originate among the Rocky Mountains, and journey gradually towards the East. Sometimes they die out on the way; sometimes they are stopped by causes, as yet unascertained, in the region of the Mississippi; but more generally they extend to the seaboard, with more or less of their original extent.

Succeeding observations, repeated, extended, and systematized till a regular series of simultaneous observations and reports is kept up all over the continent, will enable meteorologists to determine with tolerable accuracy, when hearing a storm among the Rocky Mountains, how far east it will extend, at what time it will be likely to reach a given point, and how strong it will be when it gets there. The most important modifying force, the one which will most interfere with the accuracy of these observations, will be that of the air currents of the Mississippi Valley. These may also be studied in time, so that they can be calculated upon. Then we shall nearly have attained an exact science of the weather, so far, at least, as general storms are concerned.—*Exchange.*

## Improvement in Telegraph Despatches.

Within the last few days the French telegraphic administration has introduced an ingenious check against accidents or intentional alterations in telegraphic despatches on Hughes' system. Heretofore the slip containing the message was merely gummed on to a half sheet of paper, on which it was despatched and might with little trouble be detached, and changed. To prevent this, the despatches, after being attached to the paper, is passed between a pair of watering rollers, so that any displacement will be shown by the interference with the lines of the pattern, and in addition to this the words "Empire Francais Ministere de l' Interieur, Administration des Lignes Telegraphiques," are across the face of the despatch and form an additional guarantee.

In India the conditions of the country render a different method of constructing the telegraphic wires necessary. Traversing, as the wires do, dense jungles and forests swarming with birds and animals, it is necessary to make the wires very much stronger than we do in this country. They are, in fact, small bars of iron three-eighths of an inch in thickness. An amount of rigidity is thus obtained which is necessary to meet the requirements of the country. The bars of iron are placed on the tops of bamboos at a sufficient height to allow the country carts to pass underneath them, and even to give passage to loaded elephants.

## Patents.

ACOUSTIC TELEGRAPHING.—Lancelot Hope Everitt, New Orleans, La.

I claim an acoustic battery for telegraphing, a machine which creates and modulates sounds, that, when arranged and sounded under specific symbolic formulæ, they are made to represent and express all the letters of the English alphabet and all Arabic notations, and when thus evoked into existence the machine reflects these sounds and transmits them through naked wire, buried in the land or water, to their destination, where they impart their various interpretations with such distinctness and order to the auditor who receives them, as to become the most important and efficient commissioner of intelligence.

Also, this mode of eliciting two different tones of sound from the air, by means of the *chorda tympani*, the malleus, the key, the incus, the stapes; of reflecting them from the polished phonic fossa; of conducting them to the acoustic messenger through the nipple of the incus, and transmitting them through non-insulated wire to the cochlea, vestibule, and auricular, which delivers them to the auditor with precision and regularity.

Also, this mode of associating these two modulated tones, and arranging them under five different orders of sound, expressive of letters and notations, as herein described, and this method of using similar and dissimilar silent intervals of time in separating and combining sounds, thus giving force and decided character to the symbolic formula of a letter or notation when echoed from the phonic fossa and transmitted through naked wire to the end of the auricula.

Also, this mode of creating and regulating these two primary orders of sound, and other orders evolved from them, systematically, by means of a diatonic staff and two bars attached thereto, and signaling different sounds by red and blue-colored disks, which represent two very dissimilar tones that are convertible into intelligent symbols, as herein described, or by any other means substantially the same, and which will produce the intended effect.

CEDAR RAPIDS, Iowa, April 8, 1868.

To the Editor Journal of the Telegraph:

Communication from "S" in Journal of April 1 reminds me of a message I received from Chicago this week and copied Sig. "M. BEST," but on referring to message sent in morning, to which it was a reply, I found it addressed to "Mitchell Brown & Thompson," consequently concluded Sig. should be "M. B. & T." My first copy certainly sounded the most rational and had I not known the names of the parties, should not have suspected any error, as you will see

M.	B.	e	s	t
M.	B.	and	T.	

reads either way equally well. The spaced letters are *certainly* an objection, and I think the only one to the Morse alphabet.

Yours,

L.

The systems of signaling and telegraphing adopted by government are now uniform in both our army and navy. The cadets at West Point and the midshipmen at Annapolis receive the same instructions, so that when they become officers in any contingency of land or naval service, they will be enabled to open and maintain communication, by codes of signalling and electric telegraphy identical in their operation.

It is said that chickens hatched in the natural way don't agree with those hatched by the new machine. One of the former lately told a chick of the latter, in a moment of passion, that his maternal parent was an old stove.

## Personals.

Henry O'Reilly is acting as Secretary of the National Cheap Freight Railway League in this city, with headquarters at 24 Pine street, and is also on the staff of the N. Y. *Examiner*, a Masonic paper to be issued May 1.

On the 6th of last month Sir Frederick Halliday, K. C. B., was appointed Chairman of the Anglo-Indian Telegraph Co., in place of the late Mr. Charles E. Stewart.

Mr. Edward W. Gleason, recently manager of the Western Union Telegraph Co., office at the St. Nicholas Hotel, has been transferred to the office of the same Company at the rooms of the Union League Club, corner 26th street and Madison square. The Union League Club have appointed Mr. Gleason their cashier.

Here, now, is an enterprize worth recording. The Union League Club house is the most superb and spacious of anything to be found in New York. It is a great political exchange. It is more. Market reports, stock, marine,—reports from Sandy Hook, from Wall street and from Washington, from Leagues elsewhere pour into this palatial establishment, and imbue the whole atmosphere of the place with life, animation, energy, enterprize. It is young New York discussing politics. It is a bulletin of life whose editions are ever fresh from the press, leaving the dailies far behind. As one walks through its sparkling chambers there is a sense of completeness, of exhilaration, of enthusiasm.

The wires are the sinews of the age. The fire which warms them is the only fit type of enterprize everywhere. Even the politicians are finding that out, and are making it an element of vigor with which to heighten the attraction of their clubs and prepare their victories.

## Presentation.

On the first day of April the operators and line repairers on the main line of the I. C. R. R., presented to their Superintendent, Mr. L. A. Louis, a splendid Elgin watch, together with a fine chain and three linked pin. Mr. Louis has appropriately acknowledged the same. Q.

The Committee of the New York State Legislature, to whom was committed the application of W. Orton and others for the right to lay a cable connecting France and New York, have reported favorably.

We are always glad to learn of the promotion of our early telegraph companions. We have now before us a pleasant letter from Mr. W. W. Smith, now the honored Vice-President of the Indianapolis, Cincinnati & Lafayette R. R., which, though marked "private," we must take the liberty of quoting from. Mr. Smith says: "I think it is fifteen years or more since I appeared in Louisville office to learn, and it was you who first gave me permission to receive and transcribe my first message. Since that time I have filled the positions of assistant, operator, assistant chief operator, and for eight years previous to March, 1867, was in charge of the I. C. & L. R. R. Co.'s Telegraph when I was chosen for my present position. I can assure you I have lively and very pleasant recollections of J. D. R."

We stretch our bones to you friend Smith, and shall have great pleasure when the duty of recording new honors comes to demand the service of our pen.

THE GALAXY for April is a rich and readable number, and whose reception we greatly enjoy. Our paper is too small to give much prominence to a notice of its varied contents, but we advise all to whom our paper comes to subscribe for it. On May 1, the *Galaxy* greatly enlarged will be issued by Messrs. Sheldon & Co., New York.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, APRIL 15, 1868.

### Progress of the Journal.

We are compelled to reprint our early issues to supply the demand upon us. Our edition has been 4,500 copies, which we will have to increase to 5,000. Covering a list of forty-five subscribers from one of the cities in the West, we have the following cheering endorsement:

*Respectfully forwarded to J. D. Reid, Editor, and with compliments—*

The JOURNAL appears to be giving very general satisfaction. The only wish I have heard expressed is that it might come oftener and contain more space for reading matter.

You will have to enlarge the paper to meet the requirements of the reading public.

Yours truly,

ANSON STAGER, Gen'l Supt.

### An Important Advance.

We call attention to the illustration on our first page of a non-adjusting magnet, patented by Elisha Gray, of Cleveland, O., which we regard as of very great importance. It has been proven under test to be entirely unaffected by escape currents and requires no other adjustment than that which places it under the influence of the key of the most distant or most inaccessible office of the wire on which it is placed. That done, no change is necessary. It has no spring and needs none. The flow and return of its currents are equal. It is worked by an induced current produced by a pair of magnets with a resistance not exceeding the ordinary relay. The mechanism is utterly simple, and the force equal to the best of our relays. It is a gain to congratulate the craft upon. It is a new element of hope for future perfection. The men who sleep nights over repeaters will be able to go to bed.

### Self-Closing Keys.

We deem it only duty to say that no plan of securing the closing of keys when not employed, which contemplates any disturbance of the finger-plate, or rendering it less solid or firm, is likely to be adopted by companies however ingenious these may be. The risks of error are already great enough to make it desirable to introduce mechanism which may render the manipulations in the least degree less certain. Those shown us are ingenious and have received marked commendation. We hail every effort to secure perfection in this, as in all our machinery, with great personal satisfaction. But do not multiply our dangers. We must now work in the direction of rendering errors rare and, in due time, impossible.

Our friends, Gillespie and Benton, will accept this caution kindly. The former's self-closer is beautiful and ingenious, and he promises one much superior still. Mr. Benton's key, without trunnions, is a practicable and very desirable improvement. Let them see whether a self-closer cannot be found without disturbing the finger-plate. We know it can be done, simply and easily, but we want others to work it out, and if it have a reward, to secure it.

### What is an "Ohm"?

In a carelessly written foot note in our last issue, an "Ohm" was stated to be the British unit in the measurement of the power of electric currents. In speaking familiarly of the meaning of this term, that explanation would be understood and be sufficient. Yet it is not correct, and as the term is new to many who are anxious to learn respecting these scientific terms, to which Mr. Varley's visit to us has awakened a very welcome interest, we give a full and accurate signification of the very ominous word which must hereafter be connected with the finer tests to which electric currents will be subjected.

The term "Ohm" is derived from the name of the celebrated electrician who first ascertained the laws of electrical resistance, and is a measure of resistance (not of power) in the same way as the inch or yard is a measure of length. The "Ohm," as the unit of resistance, was adopted by a committee of the British Association of Electricians and is now the acknowledged standard throughout Europe.

#### What is its use?

It is very important that all wires, relays and even the batteries should be made to undergo some test by which their integrity and ability to conduct electric currents is determined. So far, in America, this has only been done, as a general thing, by an indefinite comparison of one wire with another, and wires are never tested before being erected. Some magnets are tested by rheostats, but not uniformly. The ability to test the conductivity and resistance of magnet and line wire is very valuable, and the "Ohm" furnishes a standard for doing so.

Thus Mr. Varley, before the "Ohm" was adopted, established a "unit" by observing the deflection of a galvanometer from a state of neutrality, when the resistance of a single mile of No. 16 copper wire was added to one side of the neutralized circuit. That deflection he designated the "unit of resistance." "The Ohm" is one twenty-fifth of Varley's unit, and, therefore, by so much the more delicate and representing a much shorter wire. It represents the resistance of about 210 feet of No. 16 copper, or No. 8 galvanized wire, unexposed to disturbing causes and in a temperature of 60° Fahr.

A magnet well made and of proper wire should not show a resistance of more than say 100 "Ohms," and yet the vast majority are largely over that standard. Some even show a resistance of 1000! Hence the great need of a standard to decide the value of so important a part of telegraphic apparatus. Telegraphic lines have been rendered powerless by wire so fine and impure as to block up the passage of the current. We need a change in all this. Magnets must be tested. Wire must be tested before wound upon them. Resistance must be reduced to its lowest minimum. The "Ohm" measurer will aid in securing this, and magnets before being accepted by companies will be subjected to its adjudication. The Western Union Telegraph Company have ordered several of these Ohm standards to be made under Mr. Varley's supervision.

#### Can it be used in ascertaining the condition of the line?

In Great Britain all wires are examined by the rheostat every morning. Their proper condition is known and recorded. Whenever a deviation is shown, the extent of the obstruction is expressed in "Ohms," and when an operator could not tell by the change of his magnet that any fault existed, the rheostat has shown it and orders are issued accordingly. To all this care and nicety of inspection we are coming, and we are glad to see the signs of a sterner demand for greater perfection in all our transmitting appliances. More anon.

STEEL NEEDLES, if delicately suspended, soon become magnetic from the action of the earth, even though they might not previously have had any tendency to magnetism.

### Collegiate Telegraphic Education.

There can be no reason assigned for the foot opposition which has been made to the study of telegraphing in institutions of learning under competent instructors. The study itself is pleasant, useful, and legitimate, both as a necessary requisite for following the business of telegraphing as a means of support, as well as for general knowledge. All the scientific knowledge of general character must, in the main, be obtained before the harness of actual labor in a telegraph office is put on. A good knowledge of the laws of electricity, magnetism and all kindred subjects would add greatly to the pleasure with which an operator's labor would be prosecuted. Much indeed may be learned by an observant man after entering upon telegraphic duties, especially where the labor is not continuous, and by a study of the facts from time to time presented by the intelligent correspondents who contribute to our JOURNAL; but we would be glad if in all our institutions of learning, the science of telegraphy in all its bearings was made a part of the routine studies. We think it will be done. It will add to ordinary education the means of future support.

We have just received a circular from the Telegraph Department of the Clark Seminary, Aurora, Ill., where this branch of study has become an important addition to the institution, under the charge of Miss Lizzie W. Charles, an accomplished practical operator. The circular says: "The course of instruction includes everything that will tend to make the practitioner perfect in his duties. Besides operating, he is taught how to prepare chemicals, put up the batteries, take care of instruments, and attend to all incidental matters of that character—in short, he is instructed in the whole theory and practice, upon both sound and paper instruments."

We hope this embraces much more than the mere practical details of office work. With a knowledge of the great laws which govern the wide realm of electric currents which develop themselves by heat and cold, by atmospheric changes, by auroral influences, by terrestrial perturbations, under the power of the great currents which permeate the earth, and which still engage the attention of the finest minds, an observing man will find much which will attach him to his business, and, perchance, enable him to make discoveries of advantage to science everywhere. We notice a growing desire for a deeper and more exact knowledge in electrical matters, as well as activity of invention in the machinery of the telegraph. All these are good and hopeful. We will do our part by providing such a knowledge respecting all these interesting subjects as wide reading of current publications and skillful correspondents can supply. Meanwhile we ask our institutions of learning to broaden the area of electric study, and where possible, give the means of a practical education, under skillful teachers, of practical telegraphy.

#### Correction.

In the "Damp and Frost Test" published in our last number, the words "per cent" were used improperly in expressing the "Ratio of Improvement." If the reader will substitute "1 to 37," instead of "37 per cent," the statement will correspond with that given us by Mr. Varley.

#### Double Transmitter.

Mr. Thomas A. Edison, of the Western Union Telegraph Office, Boston, has invented a mode of transmission both ways over a single wire at the same time, which is interesting, simple, and ingenious. Double transmission is not new and has been used for many years in Germany, but Mr. Edison has simplified the process by which it is effected. We will refer to it again.

## STATE OF MAINE.

## Inviolability of Dispatches.

**AN ACT** additional to chapter fifty-three of the revised statutes of this state, relating to telegraph companies.

*Be it enacted, etc.*

**SECT. 1.** Whenever it shall be necessary to cut or otherwise disconnect the wires of any telegraph company, or to remove them from the poles or fixtures to which they are attached, in order to move a building across the same, or for any other purpose, any person desiring so to cut, disconnect, or remove such wires, shall have the right so to do, exercising reasonable care therein: Provided, that before doing so, he shall make a statement in writing, by him signed, of the time when, and the particular place where, by reference to the crossings of the streets or highways, he wishes to cut, disconnect, or remove such wires as aforesaid, and leave the same at the office of such company, if any there is, in the town where such place is situated, twenty-four hours before the time so stated; and if such company has no office in the same town, then he shall send such statement by mail to the office of such company nearest to the place named therein, by putting it into the post-office, properly directed and stamped, three days before the time stated therein.

**SECT. 2.** Whoever shall wilfully cut, disconnect, remove, or otherwise interrupt the use of any telegraph wires without first giving notice as provided in the first section of this act, shall be punished as provided in section two of the one hundred and twenty-seventh chapter of the revised statutes of this state.

**SECT. 3.** It shall be the duty of every person, or company, using or owning any line of telegraph, wholly or partly in this state, to transmit all dispatches in the order in which they are received, under the penalty of one hundred dollars, to be recovered, with costs of suit by the person whose dispatch is wilfully postponed out of its order as herein prescribed.

**SECT. 4.** Any clerk, operator, messenger, or other agent of any telegraph company, doing business in this state, who shall wilfully divulge the contents, or the nature of the contents of any private communication entrusted to him for transmission or delivery, shall be punished by imprisonment in the county jail not more than three months, or by a fine of not more than one hundred dollars.

**SECT. 5.** This act shall take effect when approved.  
[Approved February 5, 1868.]

## From the Army and Navy Journal.

"Secretary Seward is, after all, the humorist of the country. In the exchange of cable compliments during the telegraph builders' banquet in London, the other day, Mr. Seward sent this dispatch:

"I congratulate the telegraph builders that, instead of building a bridge for the tramp of hostile armies across the Atlantic, they have stretched the wire beneath it, which effectually exchanges friendly sentiments, sympathy and affection.

"In what corner of his brain Mr. Seward was able to find this idea of building a bridge across the Atlantic, it is difficult to conceive. The conception, at least, has the merit of originality. We judge that the real parties to be congratulated that this attempt was not made are the stockholders, not the 'builders.' And perhaps more than either should be congratulated the 'hostile armies' who would be expected to 'tramp' ration and fight across the Atlantic bridge."

The writer of the above is not troubled with imagination. He has no idea of any bridges but such as have stone piers or iron cables. He sees in Mr. Seward's idea only a vast arc of iron with red coats treading their weary march of miles per day thereon.

We regarded the message of Mr. Seward, considering the excitement existing respecting the Alabama claim, as a happy informal assurance that America desired peace, and hailed all enterprises which secured it. It was a kind word to England neatly enclosed in a sentiment to a company of happy telegraph constructors.

## A Defence of Telegraphic Companies.

The probable purchase of the telegraphic lines by the Government was referred to by the Hon. Robert Grimston in his speech at the half-yearly meeting of the Electric and International Telegraph Company on Thursday. He could hardly understand, he said, how, in the face of a falling revenue and the Abyssinian war, the government could be prepared to assume the responsibility of the cost of working and maintaining, at an expense of some millions of money, the existing telegraph lines of the country. He referred to the statements made against telegraph companies generally, remarking that they were so vague that he would content himself by alluding to this company in particular. It had been said generally that the company had done nothing for the public. He could only reply that twenty-two years ago a few very sanguine but far-seeing men—some of whom, he was glad to say, were at that moment directors of the company—originated the telegraph system of the whole world. They were laughed at as a set of enthusiasts, and were called "visionary;" but they persevered and went on—at first paying no dividend; and if they had lost all their capital no one would have thanked them or thought of recuperating their losses. But now that they had proved the thing to be practicable and successful, the Government were anxious to take it off their hands, which, to his mind, looked very much like a full-grown boy taking the marbles from a little one. In July, 1850, the company's charge for messages was 15s. It was reduced again to 10s., and in 1851 it was again reduced to 8s. 6d. Later in the same year the charge underwent a further reduction to 5s.; in 1855 the charge was again reduced to 4s.; and in 1865 it was reduced to half that amount for messages traveling from Inverness to Penzance, a distance of 1,000 miles. The 100 miles circuit included Birmingham, to which a message might be sent for 1s. As to starving the maintenance and neglecting improvements for the sake of eking out dividends, upon more than one occasion he had been compelled to apologize to the shareholders for the large cost of the maintenance; and as to improvements, every one which was found to be of practical utility was at once adopted. Not very long since some officers in the armies of foreign countries visited England and asked to be allowed to go over the establishment of this company. They were permitted, and allowed to take models of the instruments in use. They returned to their own countries, and shortly afterwards a flourish of trumpets announced to the world the discoveries and improvements in telegraphic instruments in use on the Continent, invented by these gentlemen. Upon examination, however, it turned out that they were the same instruments as had been in use by this company for twelve years previously. The report was adopted.—*Exchange.*

## Patent Insulator.

**INSULATOR FOR TELEGRAPH.**—Cromwell Fleetwood Varley, New York, N.Y.

I claim, 1. The method, substantially as described, of preventing the metallic pins of insulators for telegraphic wires from rusting, and the vulcanite covering from being defective and being injured, by coating the said metal pins with zinc, and then with tin, or an alloy of tin, preparatory to and in combination with the outer covering of vulcanite, as set forth.

2. As an improvement on the well-known mode of securing the metallic pins, covered with vulcanite, with the insulating-cups, by means of cement, and as a means of excluding moisture and preventing the evil effects therefrom, filling the pores and interstices with paraffine wax, applied substantially as herein described.

3. Covering pieces of wire with vulcanite, for insertion at the points of support, substantially as described.

## TARIFF BUREAU.

## Semi-Monthly Circular.

WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York.  
April 16, 1868.

TO ALL OFFICES ON W. U. LINES:

Please note the following changes in your Tariff Book, which have occurred since the 1st April, the date of the last Tariff Order:

## NEW OFFICES.

Bunker Hill, Ind., tariff same as Kokomo, Ind.  
Columbia, Ala., tariff same as Lime Kiln, Ala.  
Cayotte, Ka., tariff same as Hayes City, Ka.  
Coeymans, N. Y., tariff same as Coxsackie, N. Y.  
Erving, Mass., tariff same as Orange, Mass.  
Fordham, N. Y., tariff same as Tremont, N. Y.  
Jonesboro, Ind., tariff 5c. more than Kokomo, Ind.  
Mamaroneck, N. Y., tariff same as Rye, N. Y.  
Mannsville, Jefferson Co., N. Y. (formerly on Montreal Co.'s line), tariff same as Adams, N. Y.  
Royalston, Mass., tariff same as Athol, Mass.  
Stranger, Ka., tariff same as Lenape, Ka.  
South Lee, Mass., tariff same as Lee, Mass.  
Office at end of track of Union Pacific Railway, Eastern Division, tariff same as Hayes City, Ka.

## OFFICES CLOSED.

Batesville, Ind., Lenape, Ka., Red Key, Ind., Camillus, N. Y., Liverpool, Pa., Slatington, Pa.  
Business for Liverpool, Pa., will be mailed at Harrisburg, Pa.  
Business for Slatington, Pa., will be mailed at Allentown, Pa.

## OFFICES OPENED ON OTHER LINES.

Henderson, Texas, tariff 100 and 10 from Marshall, Texas: check Marshall.

All offices, with the exception of those named below, having "Sheet 'A' Special Rates" will check Albion, N. Y., at same rate as Medina, N. Y. Little Falls, N. Y., same as Ft. Plain, N. Y. Columbus, O., same as Cincinnati, O. Hamilton, O., same as Cincinnati, O. Fair Haven, as Conn., 10 cents more than New Haven, Conn., instead of 30 more as in last circular.

## Exceptions.

Oswego, N. Y.,	Tariff to Little Falls, N. Y.,	30 and 3
Fulton, N. Y.,		25 and 2
Baldwinsville, N. Y.,		30 and 2
Syracuse, N. Y.,	Tariff to Albion, N. Y.,	30 and 2
Utica, N. Y.,		35 and 2
Ilion, N. Y.,		30 and 3
Ft. Plain, N. Y.,	Tariff to Columbus and Hamilton, Ohio, will be given by telegraph.	35 and 3
Lockport, N. Y.,		35 and 3
Medina, N. Y.,		30 and 3
Rochester, N. Y.,	Tariff to Little Falls, N. Y.,	30 and 3
Palmyra, N. Y.,		35 and 3
Tonawanda, N. Y.,		30 and 3
Buffalo, N. Y.,	Tariff to Little Falls, N. Y.,	30 and 3
Lyons, N. Y.,		35 and 3
Clyde, N. Y.,		30 and 3
Oswego, N. Y.,	Tariff to Little Falls, N. Y.,	30 and 3
Fulton, N. Y.,		35 and 3
Baldwinsville, N. Y.,		30 and 3
Syracuse, N. Y.,	Tariff to Little Falls, N. Y.,	30 and 3
Oneida, N. Y.,		35 and 3
Rome, N. Y.,		30 and 3
Utica, N. Y.,	Tariff to Little Falls, N. Y.,	30 and 3
Covington, Ky.,		35 and 3
Louisville, Ky.,		30 and 3
Frankfort, Ky.,	Tariff to Little Falls, N. Y.,	30 and 3
Lexington, Ky.,		35 and 3
Cincinnati, O.,		30 and 3
Cleveland, O.,	Tariff to Little Falls, N. Y.,	30 and 3
Dayton, O.,		35 and 3
Bridgeport, O.,		30 and 3
Wheeling, W. Va.,	Tariff to Little Falls, N. Y.,	30 and 3
Offices between Cleveland and Buffalo on Lake Shore R. R.,		35 and 3
check Columbus, O., 25 cents more than to Cleveland, O.		30 and 3

Unless you have been otherwise ordered these changes will go into effect April 20, 1868.

## GENERAL INFORMATION.

Post Office address of Sonora, O., has been changed to West Sonora, Preble, Co., O.; and Vienna, Rush Co., Ind., has been changed to Steele's P. O., Rush Co., Ind.

WILLIAM ORTON,  
President.

**U. S. TELEGRAPH CO. STOCKHOLDERS.**—The undersigned will attend to the sale or exchange of United States Telegraph Co. stock for actual shareholders, without commission. U. S. stock can be exchanged for stock of the Western Union Telegraph Co., three shares of the former for two of the latter, as per contract. Odd shares will be bought at market rates, i. e., two-thirds of the market price of stock of the Western Union Telegraph Company.

J. D. REID,  
Ex. Rooms W. U. Tel. Co.,  
145 Broadway, N. Y.

**New Indian Telegraph.**

A meeting has been held in London to improve telegraphic communication with India. A sub-marine line is proposed from England to Alexandria, thence across the Isthmus of Suez to Bombay, by which means all the present complications arising from the different nationalities whose countries are traversed by the lines, would be avoided, and the practical safety as well as the complete intelligibility of telegraphic communication with India would be ensured. It was observed that intelligence from the seat of war in Abyssinia would, in such case, reach England in six hours. The last despatch received was twenty days overdue. A committee of leading merchants was appointed to hold communications with the House of Commons upon the subject.

**The Frog's Muscular Force.**

Very careful experiments have been recently made in regard to the force which the muscle of a frog can develop in contracting. M. E. Weber of Leipsig measured this force, and found it equal to about 600 grammes (9,000 grains) for each unit of section—the unit in this case being a square centimetre. This is something enormous. But the results thus obtained are not as curious as those arrived at in the investigation of the velocity of nerve-force. Recent determinations show that the nerve-current which transmits sensations to the brain, and the orders of the will to the extremities of the body, requires a certain time to travel in. Impressions coming from without are not perceived at the instant they are produced—they travel along the nerves at the rate of 25 to 40 yards in a second, which is the same speed as the carrier pigeon, a hurricane, or a locomotive engine at its quickest speed, but very much less than that of a cannon ball. At this rate, we are conscious of an injury to one of our feet about the twentieth of a second after it has actually occurred, and the commands of the will proceed equally slow. In the human body the time thus lost is unimportant, at least for ordinary matters, though in astronomical observations it gives rise to that curious error which differs with different individuals, and has been corrected by what is called the "personal equation." It would appear that the velocity of the nerve-force is not the same in all individuals.

**Animal Electricity.**

M. Schultz Schulenstein has lately published his investigation of the relation of electricity to muscular action. His novel and startling conclusions have been thus formulated:

1. The supposition that living muscle produces electricity is incorrect. If needles be plunged into the foot of a living animal and be placed in connection with a galvanometer, no deflection of the galvanometer needle occurs.

2. Muscles removed from the body give evidence of electricity, but this is because of the combination of the decomposing tissue with the oxygen of the air.

3. Salt water causes the galvanometer needle to be deflected. This explains why salted meat gives evidence of electricity.

4. The supposed electric current in the human muscle is caused by the salt water in contact with the tissue.

5. In diseased structures the electric current is derived from the decomposing tissues.

6. The electricity of the secretions is also derived from the decomposing tissues.

7. Animal electricity is an illusion.

The author has requested the French Academy of Sciences to appoint a commission to witness and report on the experiments upon which his conclusions are based.

**Expanding the Lungs.**

Step out into the purest air you can find; stand perfectly erect, with head and shoulders back, and then, fixing the lips as if you were going to whistle, draw the air through the lips into the lungs. When the chest is about half full, gradually raise the arms, keeping them extended with the palms of the hands down, as you suck in the air, so as to bring them over the head just as the lungs are quite full. Then drop the thumbs inward, and after gently forcing the arms backward and the chest open, reverse the process by which you draw your breath until the lungs are empty. This process should be repeated immediately after bathing, and also several times through the day. It is impossible to describe to one who has never tried it the glorious sense of vigor which follows this exercise. It is the best expectorant in the world. We know a gentleman the measure of whose chest has been increased by this means some three or four inches during as many months.

**Water as a Gas Absorber.**

Set a pitcher of water in a room, and in a few hours it will have absorbed nearly all the respired and perspired gases in the room, the air of which will have become purer, but the water utterly filthy. The colder the water is, the greater the capacity to contain these gases. At ordinary temperature, a pail of water will contain a pint of carbonic acid gas, and several pints of ammonia. The capacity is nearly doubled by reducing the water to the temperature of ice. Hence, water kept in the room awhile, is always unfit for use. For the same reason the water from a pump should always be pumped out in the morning before any of it is used. Impure water is more injurious than impure air. This shows the economy and the convenience of a modern ice pitcher—a splendid invention, which, as it seems, is more than ornament and show; aye, it is really and absolutely a necessity. Let these hints be heeded by our health-loving and life-preserving readers.

**SIFTED WHEAT.**—Gothold one day looked on while a farmer's wheat was being thrashed, and observed that the men not only stoutly beat it, but trod upon it with their feet; and finally, by various experiments, separated the good grain from the chaff, dust and other impurities. How comes it, he asked, that whatever is of useful nature, and intended to be profitable to the world, must suffer much, and be subject to every kind of ill-treatment; but that man, who himself does with other things as he lists, is unwilling to suffer, or to permit God to deal as he lists with him? Wheat, which is the noblest of all products of the earth, is here thrashed, trod upon, swept to and fro, tossed into the air, sifted, shaken, and shovelled, and afterwards ground, re-sifted and baked, and so arrives at last upon the tables of princes and kings. What, then, do I mean in being displeased with God, because he does not strew my path with rose-leaves or translate me to heaven in an easy chair? By what other process could the wheat be cleansed? And how could I be sanctified or saved were I to remain a stranger to the cross and to affliction?

Dr. Chalmers beautifully says: "The little that I have seen of the world and known of the history of mankind, teaches me to look upon their errors in sorrow, not in anger. When I take the history of one poor heart that has sinned and suffered, and represent to myself the struggles and temptations it passed through; the brief pulsations of joy; the feverish inquietudes of hope and fear; the tears of regret; the feebleness of purpose; the scorn of the world that has little charity; the desolation of the soul's sanctuary, and threatening voices within; health gone, happiness gone; I would fain leave the erring soul of my fellow-man with him from whose hands it came."

**Life.**

Had but the heart that thrills a three years' boy,  
A voice to speak, 'twould say that life is joy!  
Note thou the youth whose impulses naught can tame  
That life is action, tongue and limbs proclaim.  
The man whom well spent years from dread release,  
Secure in knowledge, tells thee life is peace.  
And the grey sage who smiles beside the grave,  
Knows life is all, and death a dusty slave!

—JOHN STERLING.

**Poisonous Visiting Cards.**

The sale or manufacture in the city of Munich of the much admired crystalized or "mother of pearl" visiting cards has been forbidden by law. For a short time subsequent to their introduction into that city, these cards had great popularity, the demand far exceeding the supply, but falling under the notice of the medical director of the sanitary department of Munich, he caused an investigation to be made concerning the composition of the crystalized surface, and consequent upon the report of Professor Wittstein, to whom the examination was committed, the tabooing order was issued. The crystalizing material, the professor found on applying the necessary tests, is a soluble salt of lead, a poison the more dangerous, especially to children, from its pleasant sweet taste.

**Curious Facts about Water.**

The extent to which water mingles with bodies, apparently the most solid, is very wonderful. The glittering opal, which beauty wears as an ornament, is only flint and water. Of every 1200 tons of earth which a landlord has in his estate, 400 are water. The snow capped summits of Snowden and Ben Nevis have many million tons of water in a solidified form. In every plaster-of-paris statue which an Italian carries through our streets for sale, there is one pound of water to four pounds of chalk. The air we breathe contains five grains of water to each cubic foot of its bulk. The potatoes and turnips which are boiled for our dinner have, in their raw state, the one seventy-five per cent., and the other ninety per cent. of water. If a man weighing ten stone were squeezed in a hydraulic press, seven and a half stone of water would run out, and only two and a half of dry residue remain.

A man is chemically speaking, forty-five pounds of carbon and nitrogen, diffused through five and a half barrels of water. In plants we find water thus mingling no less wonderfully. A sunflower evaporates one and a quarter pints of water a day, and a cabbage about the same quantity. A wheat plant exhales, in 175 days, about 100,000 grains of water. An acre of growing wheat, on this calculation, draws and passes out ten tons of water per day. The sap of the plant is the medium through which the mass of fluid is conveyed. It forms a delicate pump, up which it flows with the rapidity of a swift stream. By the action of the sap various properties may be assimilated to the growing plant. Timber in France is, for instance, dyed by various colors being mixed with water, and sprinkled over the roots of the tree. Dablias are also colored by a similar process.

A Dutchman was relating his marvelous escape from drowning, when thirteen of his companions were lost by the upsetting of a boat, and he alone saved. "And how did you escape their fate?" asked one of his hearers. "I did not go in the pote," was the Dutchman's placid reply.

**TO DETECT ALLOYS REPRESENTING GOLD.**—To distinguish gilded objects from those which have only the appearance of gold is a very easy operation. For this purpose use a solution of chloride of copper, and if the object is only an alloy it is covered immediately with a brown spot, which is not the case if it is gold or gilded.

**Telegraphers'****Mutual Life Insurance Association.**

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

J. D. REID, Treasurer.

**DIRECTIONS TO APPLICANTS.**

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

IMPROVED TELEGRAPH INSTRUMENTS,

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed. His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them. Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

PRICES.

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	18 00
Main Sounders same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	4 50 to 6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package.

He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers prices.

## THE ORIGIN OF ELECTRICITY.

### Electric Motives.

*From the Westminster Review.*

In treating of heat as an electro motive, phenomena first brought to mind, of which the following may be considered as the type. We take two wires of different metals and connect one end of each with the other, so as to form a common circuit. As long as both the joints thus formed have the same temperature, no electricity can be observed; but, as soon as the temperatures become different, what is called an electrical current will set in. Now it is necessary to remark in the first place, that, supposing the difference of temperature in the two joints—previously at the common temperature—the atmosphere—was brought about by an application of heat at one contact, the other remaining as before; this application of heat does not constitute an absolutely new circumstance in the experiment, for both contacts originally possess some heat, and the introduction of fresh heat can only cause an augmentation of such heat at the point of application.

The case is similar as with the two scales of a balance containing equal weights at first, but in one of which an additional weight has been subsequently added. In this example, the additional weight acts as a motive for the upsetting of the balance, previously in equilibrium; but the origin of the phenomenon is found in the attraction of gravity for all the weights in the scales. The subtraction of weight from one of the scales has the same effect as the addition of an equal weight in the other scale, and as equilibrium in the case of equal weights, is the consequence of the equal actions exerted upon each of the scales, but in opposite directions. Similarly, in the thermo-electrical couple formed by two wires in contact at both ends, the diminution of temperature, or the subtraction of heat, at one contact, has the same result as the augmentation of temperature, or the addition of heat, at the other. Hence, since cold is not a principle or substance but altogether something negative, the cooling of one contact, in itself, could not produce any electrical results, except such as were already before in latent existence. That is to say, whilst the two contacts are at an equal temperature, each is the seat of an equal electrical action, but exerted in opposite directions; and the addition or subtraction of heat acts as an electro motive by upsetting the electrical balance previously established.

From the preceding statement it will appear to be altogether wrong to assert that electricity is gained at the expense of heat; for actually heat may be gained, that is to say transferred, by placing one of the thermo-electrical joints in contact with a cold substance, and an electrical current be produced, that is electricity be gained, at the same time.

Nor does the production of the current depend, as has been surmised, but never proved by any facts, on the unequal loss of heat by radiation in the two wires of different metals. That such cannot be the case, has been well shown by M. Magnus. Somewhat more spacious is the view which ascribes the production of thermo-electrical currents to the un-

equal propagation of heat within the two elements of the thermo-electric couple. But this view also may be disproved by the following facts which have well been brought out by M. Gauguain. The strength and direction of the thermo-electrical current depends on the temperature of the two contacts of the couple in which it circulates. If the temperature at one contact is kept constant, but the temperature of the other is made to vary, the strength of the current will vary at the same time; and when the variable temperature has reached a certain point, the direction of the current may become the reverse of what it previously was. Hence, on the hypothesis that the current is produced by the unequal conduction of heat, when the current is reversed the conductive powers of the two elements of the couple must be similarly reversed; which there is no evidence to prove. Moreover, it is found that the temperature at which the reversal in the direction of the current takes place—by an alteration in the temperature of one of the contacts—depends on the magnitude of temperature of the other contact; but this temperature cannot influence the reversal of conductive powers of the first contact, which is hence incapable of accounting for the production of the current at all. It might be objected that the temperature of the invariable contact, though it cannot influence or modify the temperature, and hence the conductivity at the other contact, may yet do so in the case of the intermediate portions, were it not found that this circumstance, which, indeed, would influence the relative conductive powers of the elements as a whole, has no influence at all on the strength of the thermo-electric current, which depends only on the temperature of the contacts, but not on those of the intermediate parts, if what are called resistances are properly taken into account.

It has already been shown that the electric current of a thermo-couple is the resultant only of the two opposite electrical actions taking place at each of the two contacts separately, and depending on temperature for strength. As neither the consumption nor the radiation or conduction of heat, by the light of phenomena, appear to be the source of the electrical action observed, it remains only for us to conclude, for the present, that at the contact of heterogeneous matter an electrical action takes place which is regulated by temperature as to strength. In studying, however, further phenomena, we may yet penetrate deeper into the real nature of thermo-electrical action.

Besides the electrical action which differences of temperature give rise to in couples of wires, or generally in two different pieces of metal joined in a circuit, a similar action is found to be exerted in single pieces of metal through inequalities of temperature. A metal bar being heated from a section not symmetrically placed to the ends of the bar, and then approached to a magnet, was found by Yelin to behave as if it were itself a magnet, showing thereby the existence of electrical currents in its interior, which subsided as soon as the temperature of the bar was equable throughout. Yelen, and independent of him, Seebeck, found also that the two ends of a

wire, being kept at different temperatures, and then made to touch, produce a current of electricity in their own circuit. A wire bent into a circuit, but without its ends actually touching, and heated at a point not symmetrical to the ends, as shown by M. Gauguain, may similarly evolve a current of electricity for a time—as long, namely, as the temperature of the wire has not become invariable at each point, by the equilibrium between the heat received by conduction, and the heat lost by radiation or communication to the air. This last experiment shows also that the conductor and radiation of heat, do not, in themselves, engender any electrical currents; for here is a case where both conduction and radiation take place, and yet no current produced, notwithstanding the dissimilarity of both with reference to the two portions of the wire situated at either side of the heated point. M. Becquerel has shown that at the terminals of a metallic wire, so-called statical effects may likewise be evolved, if the terminals are kept at temperatures different from each other.

All these phenomena point to this one conclusion—that for the production of electricity it is not absolutely necessary that substances dissimilar in nature, or even but in texture, should be in mutual contact; but wherever differences of temperature prevail in an otherwise perfectly homogeneous fragment of matter, there electricity manifests itself likewise, especially if the substance be a conductor. If these differences of temperature are themselves variable with time, what is called an electrical current sets in; but if invariable with time, in some cases only statical results may be observed. The laws of thermo-electricity, as deduced from experiments, conclusively establish the fact in a mathematical form—which, however, the above mentioned phenomena by themselves indicate with sufficient clearness—that to each substance appertains a certain electric power which depends: 1. On its chemical nature; 2. On its mechanical texture; 3. On the temperature and physical state. When these qualities are uniform in every point of any single body or complex of masses, the electric power, so far, is disguised to human apprehension; but wherever any variation in those qualities does take place—as by varying the temperature in different parts of the same fragment of matter, which, as shown by Sturgeon, may affect any form whatever; or by varying its texture, or finally, by rendering the substance altogether chemically non-homogeneous—electrical results make their appearance in consequence of the disturbance in the equilibrium of electric powers previously existing. It would be wishing to go too far, for the present, to investigate the nature of the electric power, the mode of its equilibrium in perfectly homogeneous and equally warm matter, and the manner in which the want of such equilibrium may entail as a consequence the well known electrical phenomena; for all this belongs to the inquiry into the form of electricity, which we have excluded from the scope of this essay. But so much must be accepted as a fact resting upon the impregnable, and, in fact, upon the unassailed evidence of thermo-electricity, that substances without being in any way chemically altered or otherwise modified, may give rise to statical electricity,

and to dynamical electricity; but in every such case, for any phenomenon to become perceptible, the presence of two fragments of matter (be they but two molecules of one and the same body) in some respect heterogeneous, is required; similarly as in gravity the presence of two fragments or atoms, at some distance from each other, is required for the effect of gravitation to produce any, though not necessarily ocularly, perceptible results.

What has been said of solids is true also of the contact of solid and liquid and of liquids with each other, as also at the contact of gases with metals. Seebeck, Faraday and Wild, have illustrated all this by actual experiment. There can be no doubt, on the other hand, that the currents which are observed upon introducing the inoxidable ends of a wire in unequally hot parts of a flame, are purely thermo-electrical and have nothing to do with a supposed production of electricity by combustion.

These facts go some way to prove that the electric power is universal among matter and universally dependent upon temperature.

### Correspondence.

From a New Correspondent.

To the "Journal of the Telegraph."

St. Louis, April 18, 1868.

DEAR JOURNAL:—To you, your editor, and your patrons, I make my introductory bow. Hoping that our future acquaintance may be mutually agreeable, and that we may meet at least once a month, I take my pen, after a hard day's work, and proceed to give the Telegraph fraternity generally, through your medium, an inkling of what is going on of interest to them in this section of the country.

The Union Pacific Railway, Eastern Division, of Kansas—whose iron bands, with its Eastern connections, is soon to span the continent—is already completed three hundred and sixty-five miles west of the Missouri River at Wyandotte, and the work of track-laying is being pushed forward at the rate of a mile and a half per day. The Western Union lines cover this important route, two wires having been erected to Ellsworth, two hundred and twenty-five miles west of Wyandotte, and one wire on the remainder of the road. A strictly first class line is being constructed on this road by Col. R. C. Clowry, Superintendent of the Western Union lines, as fast as the track is laid. A telegraph office is maintained in a box car at the end of the track. Said car is moved forward as the track and line progresses. By this arrangement telegraph communication is kept up between the contractors and builders and the officers and agents along the road, rendering them invaluable service. On that portion of the road west of Ellsworth, herds of Buffalo can be seen, from almost every train, frequently coming near enough to be shot down by passengers. Large droves of wolves also hover around the kitchen cars of the construction parties at night, and a great number of them are shot down and poisoned by the workmen, who make use of the otherwise worthless creatures by selling their skins.

The Chicago and Mississippi Telegraph lines have been leased by the Western Union Company from the first of April last. That portion of these lines on the North Missouri Road have been placed in Supt. Clowry's District, and those on the Hannibal and St. Joe Road go under J. J. S. Wilson's control. General Stager arrived here on Sunday last, remaining with us until Tuesday, when he left for Chicago. His visit here was probably in connection with the above contract.

Whether it is that the air west of the Mississippi is congenial to the spirit of telegraphers, or that they prefer their present employers to any others, or from divers causes are unable to leave this part of the country I know not, but I do know that changes among our profession hereabouts, are few and far

between, which speaks well for all concerned. Among others that have come under my notice lately is that of W. B. Clowe who has left Springfield, Ill., and gone to Cheyenne, Dak., where he, Tony Sanford, Harvey Nichols and others have the privilege of dining in a tent for which they pay the moderate sum of from four to five dollars per day. Don't some of your Eastern men want a little of that in their line? H. B. Henderson takes Clowe's late position in Springfield. Jim Bay, formerly of Detroit, is in Cincinnati "waiting for something to turn up," and I hope he will be more successful than Micawber. J. T. McConnell of Baltimore, is resting on his oars in Chicago. C. E. Turner lately of this office, having quit the business, is now rustivating at Peeveley, Mo.

And now to another theme, from lively to severe. A black sheep in our flock has turned up lately in the person of a youth named Brooks, who has been employed by the Chicago and Alton Railroad Company, as agent and operator at Braidwood Station near Joliet, Ill. On Saturday night last he robbed the company's safe and made off with over five hundred dollars. A detective was in this city on Sunday hunting him, but so far without success. Superintendents would do well to keep on the look out for this individual, as he is very well educated and prepossessing. *Au revoir,*

VOYAGEUR.

SPRINGFIELD, ILL.,

MR. EDITOR: Would it not be well for Telegraph Companies to put on their message-blanks a few simple directions to the public, how to prepare their messages for transmission? Say something similar to the following: Write plainly; do not abbreviate; duplicate numeral words in figures; give full address and date.

That not inconsiderable class of the people who use the telegraph the least, are the least intelligent, and are the most indifferent chirographers; and to them, if indeed not to most of the people, the telegraph is an instrument more of wonder and novelty than of knowledge.

The value of such directions, to our profession, are obvious; and it is singular that they are so strangely overlooked.

W. W. K.

CANTON, MISS., April 8, 1868.

To the Editor of The Journal of the Telegraph:

Apropos of profanity—why is it that the operators at large offices are so disrespectful and profane in their transactions with the managers of smaller offices? They certainly will not plead that a pressure of business is a sufficient cause to make them forget the laws of etiquette and true politeness. Politeness aids instead of retarding the dispatch of business. But whatever reason they may give for using harsh expressions, the young operators certainly get the benefit of them.

Telegraphers, you who have advanced so far in the art, and who well know the difficulties to be encountered and overcome at first (for you have all gone over the same road), treat young operators with more deference and forbearance!

We have known many operators who wrote "od" and "out" for "O K," who were kind and intelligent gentlemen; and whom, if you were to visit, would so surprise you with politeness and hospitality, that you would resolve never to upbraid "plugs" again.

D.

EDITOR JOURNAL: S. G. Burnside, proprietor of the American House, at Marion, Ohio, was shot, and probably fatally wounded, Monday morning last, by Geo. Hunt, night telegraph operator for the Bellefontaine Railroad. A difficulty occurred between the parties about remarks made by Burnside detrimental to the character of Hunt's wife. Burnside was alive at 4 P. M. Hunt has been arrested and is in jail.—*Urbana Union, April 8th.*

### Effects of Light on Vitality.

In a remarkable paper addressed to the French Academy of Sciences, Dr. Dubrunfaut examines the effects of light on vegetable and animal life. His researches of MM. Gratiolet, Cloëz, and Cailletet in a great measure proved that the red rays of the luminous spectre are those to which the important physiological function exercised by the plants is to be exclusively attributed. The leaves in this case act as analysers of white light; they reject the green rays, which constitute the physical complement of the red ones; and it is thus the various hues under which the organs of vegetation are seen by us may be explained. If plants were exposed to green illumination only, that would be tantamount to their being in the dark. But this kind of light, which the vegetable kingdom refuses to absorb, precisely that which is coveted by the animal world. Red, the complementary color of green, is the color which, owing to the blood, tinges the skin of a healthy human subject, just as the green color of leaves is the complement of the one they absorb. From this principle, so fully established by experiment, M. Dubrunfaut passes to its practical application to domestic life. All kinds of red should be proscribed from our furniture, except curtains. Our clothes, which in point of fact play the part of screens, should never be green, while this color on the contrary, should predominate in our furniture, its complementary one being reserved for our raiment. In the same way he contends that the salubrious influence of woods and forests is a luminous, and not a chymical effect. In support of these views he mentions cases of patients whose broken constitutions were restored merely by long exposure to the sun in gardens deprived of trees or other obstacles to light: he quotes the instance of four children that had become chlorotic by living constantly in one of the narrow streets of Paris, and that regained their health under the beneficial influence of the solar rays on a sandy sea coast.

### More Improvements.

L. G. Tillitson & Co. have applied for a patent for a new mode of securing the ordinary glass insulator to the pin. This consists of a thread formed on a tin cup corresponding to the size of the pin, which is inserted by the plunger when the glass is cast, and is thus so firmly embedded as to be irremovable. The thread is not over an inch and a half in length, corresponding to a similar thread formed on the pin. By this simple device a perfect thread is secured, and the pin and glass united with ease and quickness.

### Electricity as a Motive Power.

There is now on exhibition at No. 335 Broadway, a machine which derives its motive power from electricity. The machine itself consists of a series of electro-magnets placed on each side of a belt wheel. Projecting from the wheel and attached to it are a number of arms having steel plates at the end, and by means of the successive magnetic attraction of these plates the wheel is made to revolve. By an ingenious contrivance an even speed is secured and regulated. The agents, Messrs. Gaume & Basset, claim that the cost of running the machine is but twenty cents per day. A small battery in an adjoining room supplies the electricity. The wheel is 36 inches in diameter, and can be made to complete 140 revolutions a minute. A number of practical mechanics have examined the machine, and pronounced it to be valuable as a means of applying motion to small printing presses, sewing machines, street cars, and to other purposes, where only limited power is required.

Eighteen million letters were collected from the lamp-post boxes of New York last year, and about the same number were delivered by carriers.

**Insurance.**

To the Editor of the Telegraph.

SIR.—It really gives me no little satisfaction to be enabled to assure you that the interest of the fraternity in this section of the country, is in nowise abated towards our Insurance association. I trust ere long to know that every telegrapher in the country, is so far Pickwickian as to be a Member of our Particular Club. I hope to give substantial attestation of the interest here in a brief season. We desire success to the association, both for the sake of good fellowship and to have a larger inheritance to leave behind us. In this we are magnanimously selfish. The association is not as well known as I could desire. It cannot be because they do not know of it, but because they do not appreciate the peculiar advantages the association offers, and think but little of the future.

To our fraternity a life insurance as easily secured should be recognized as a necessity. The association really presents the most liberal and charitable phase of Insurance extant; I am confident if the fraternity will but think of it seriously, as they ought to do they would lose no time in applying for certificates. My amiable, careless friend, I would say to every telegrapher, think seriously of your future, long enough to secure for it your own "six feet by two," and something besides for the defenceless heads you may leave bent with a weightier woe than "the heart's resignation." You feel so strong, perhaps, you do not pause to think Death's shadow may to-morrow fall between the Sun and you! So young you scarcely think that yonder quiet churchyard, where the daisies bend to the footfalls of the zephyrs, holds blossoms, of every stage of maturity. Life seems so sweet, so full of buoyant hopes, there seems future enough to make provision for that sad last hour that comes so swift and certain in its dread uncertainty to all. Why will not all see the good so near and avail themselves of it?

"Oh, alas! and alas! must it ever be so,  
That men stand in their own light wherever they go,  
And fight their own shadows forever?"

LOGANNE.

PA., March 25, 1868.

**Automatic Telegraphing.**

We have repeatedly expressed our opinion that telegraphic improvement would soon take the direction of rendering all its operations automatic. We see that even in England the work has commenced.

**AUTOMATIC TELEGRAPHING.**

This instrument is being worked with much success by the Electric Telegraph Company, and the rate of speed attained is perfectly marvellous. The messages are punched out upon strips of paper and sent with a rapidity far exceeding the manipulative skill of the most experienced operator.

The punching system was introduced in England in 1848, by Alex. Bane, but never practically employed because of the condition of the lines. Our numerous engineers, Clark, Varley, Culley, &c., have so improved the construction of telegraph lines that little more is left to be desired.

A great improvement has recently been effected by Mr. Culley, of the Electric Telegraph Company, in the preparation of the punched paper ribbon. In the ordinary way, the punches are struck by pieces of vulcanite held in the hand, but Mr. Culley has placed above each punch a small cylinder containing a piston acted upon either by vacuum or compressed air. The valves are worked by finger keys as light on their touch as a piano forte. The softer sex who operate these instruments in Telegraph Street have their labor rendered as gentle as their natures. Punching is effected with the greatest ease and rapidity. Mr. Culley has not patented his invention, contenting himself with simple publication.

American companies must not slight these tendencies to rapid and exact transmission. It will soon be

demand— and the instinct of self preservation from the result of error must lead to the adoption (in time) of purely automatic apparatus.

The punching process by machinery has been patented in the United States, by Hummaston—but not yet applied.

**Sulphur and Electricity.**

From Schellens Der Electro Magnetische Telegraph.

In the year 1848, Dr. Werner Siemens made the first experiment to isolate the conducting wire by means of an envelope of Gutta Percha. The Gutta Percha, the juice of a tree, similar to India Rubber, had come about this time from the East Indies, *via* England, into trade, and was found to be an excellent non-conductor of electricity. It is not at all affected by cold water; solutions of alkali, spirits of wine, acid of vinegar, muriatic acid, and even sulphuric acid can only affect it very slowly.

It has the important peculiarity that it can be worked under the influence of heat, and can be wrought into the greatest variety of forms, and by this peculiarity it is possible to envelope the conducting wire in this material.

Soon mechanical means were invented to make this covering of conducting wire from Gutta Percha, and these have been brought to the greatest perfection.

When the results of the experiments previously made proved satisfactory, the Prussian government ordered (in the year 1847) the use of a greater quantity of conducting wire, enclosed in Gutta Percha, and 300 German miles (1380 American or English miles) were made and put down in Berlin.

The want of experience of the peculiarities of the new material, and the then imperfect machinery for covering the wires, as well as the haste in putting them down—caused by the threatening political circumstances of the times—caused many faults in the work, and soon the lines ceased to work. The fault was, that the Gutta Percha had been mixed with sulphur to preserve it against the influence of changes in the temperature, and to increase the power of isolation. But afterwards it was found out that the sulphur mixed with the Gutta Percha combined with the copper of the wire and formed sulphate of copper; that the galvanic current dissolved the sulphate of copper, which, penetrating the Gutta Percha, made it a loose spongy mass through which the water penetrated, and the isolating cover was totally destroyed.

NEW YORK, April, 1863.

**Improved Telegraphy for Stockbrokers.**

A very simple and ingenious device, the invention of Mr. Edward A. Callahan of Brooklyn, N. Y., is now being introduced among the stock-brokers of New York City. The apparatus consists in a novel printing telegraphic instrument, which may be placed in each stockbroker's office, requires no operator, and yet sends out a printed slip in each office simultaneously with a slip of like character in all the others with which the telegraph line may be connected. So that the prices of stocks, as changes take place in the Stock Board, may be reported to each broker without involving the necessity of his leaving the office as hitherto. Hundreds of these instruments are already in process of construction for use in banks, brokers' offices, etc., and wherever at work are reported to give great satisfaction. The invention can be applied to many other purposes, and will prove equally valuable in the distribution of commercial news, both foreign and domestic.

Artemus Ward was fond of telegraphing, and studied it for amusement. He was a very good "sender." To the telegram of a California Lecture Committee, "What will you take for 100 nights?" Artemus Ward promptly replied: "Brandy and water."

**TELEGRAPHY IN SWITZERLAND.**—The reduction of the tariff upon telegrams in Switzerland, to a uniform charge of half a franc (ten cents) a message has not proved the failure that many anticipated. In January, 1867, the number of dispatches throughout the country was 50,513 against 86,461 for the same period in the present year. A comparison of the amount received will show that the revenue has not diminished in consequence of the reduced tariff. In January, 1867, the receipts were about \$11,900, against \$13,060, during the same period this year.

**NATURAL ILLUMINATING GAS.**—The New Orleans Gas Company seem likely to find a formidable competition in the sources of natural gas, which have been discovered in several places near the city. It is only necessary to sink an iron tube to a depth of forty feet, when the gas begins to flow out with a great steadiness, at the rate of five feet per hour, and is accumulated in suitable reservoirs. The natural gas burns with a clear, white flame, equal, it is said, to the best purified coal gas.

Mr. P. H. Shaughnessy for the past 3 years one of the chief operators in the New York office of the Western Union Telegraph Company, has resigned to take the assistant superintendency of the New York Stock reporting line.

Mr. A. J. Burton of the Western Union Central office, N. Y., has been transferred to the office at the St. Nicholas Hotel.

The letter of A. A. F. of Hartford, has been duly received. Letters of interest and value from other correspondents will have attention.

**THE TELEGRAPH POSTAL SYSTEM.**—As soon as convenient after the close of the impeachment trial, Mr. Washburn, of Illinois, proposes to introduce his bill in the House to establish the telegraphic postal system, heretofore referred to in these dispatches.

THE wires of the Mississippi Valley Telegraph are being strung between Dubuque and Lansing.

SOME interest has been excited by the publication of a letter from a Mr. W. C. Dodge, describing a type-setter in which electricity is the motive-power. The idea is thrown out that it will be possible to have such a machine stationed in New York, with the manipulator in Washington, the reporter setting up his own report.

An ingenious operator in New York has been at work for many years to accomplish this very curious and seemingly impossible result. He hopes in about two months more to demonstrate its possibility. If he does, it will give a new and wonderful insight into the possibilities of the future, and we sincerely hope for its success.

THE Paris *Siecle* states that the Director-in-Chief of the French Telegraphs has decided that each of his servants shall wear a uniform, and also carry a sword with a brass pommel and scabbard. We would be glad to see some neat uniform adopted in the American service, and messengers required to keep themselves clean; but we have no desire to see daggers put into the hands of boys whose duties are so peaceful, and who are unexposed to any danger which would seem to require such a defence.

Our old colleague, Rufus Bullock, who was at one time "House" operator, is the Republican candidate for Governor of Georgia. He is also the President of a railroad down there, and agent for an express company.

The Atlantic cable is not included in the proposed purchase of all the telegraph lines in Great Britain by the government.

Hon. B. B. French, who officiated as orator at the inauguration of the Lincoln Monument at Washington, was the second President of the Magnetic Telegraph Company.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, MAY 1, 1868.

### May.

There's perfume upon every wind—  
Music on every tree—  
Dews for the moisture-loving flowers—  
Sweets for the sucking bee,  
The sick come forth for the healing air.  
The young are gathering flowers,  
And life is a tale of poetry  
That is told by golden hours.

### Ladies as Operators.

There has been no graver question proposed in the domain of our political or social economies than the employment of women. Especially has this been so in America, where the very desire to elevate and protect female character by keeping woman from all occupations where the delicacy of her nature would be blunted, now seeks from the same desire to aid the sex, to provide her with congenial and remunerative labor. With all the faults with which American society may be charged, this one desire to elevate woman, to rescue her from the degradation of a former age, must ever stand acknowledged. The sentiment of our people is to plant her where she will in purity, in excellence, in gentleness, in a realm of usefulness fitted for her, in employments which will not harden, in contacts which will not degrade, accomplish her designed mission of gentle conservation of all that society needs for its purity, its comfort, and its power.

The first lady operator employed in connection with the Telegraph system in America was appointed by the editor of this paper, and still occupies her post, if we mistake not, at Westchester, Pa. We had several reasons for appointing her. She had agreeable manners, a pleasant face, a very evident desire to be a self sustaining institution. To such influences we trust no one will find fault if we confess ourselves susceptible. She was, beside, moderate in her expectations, willing to be obedient, determined to do her whole duty.

What chiefly attracted us, however, was as follows: We used to soliloquize in those early days, and, leaving the fair face of the applicant for the nonce, we talked to ourself thus.

Here is a business, new, engaging, clean, wonderful. Society must use it. Men and women must send their messages over it. Even their secrets must be borne along the narrow thread track in voiceless quietude to hearts they will warm or chill.

Can a woman keep a secret? Ah! they say she can't. But we knew better. There is no fidelity like the faithfulness of a faithful woman. But she must be a true woman to be thus loyal. We thought this waiting Emma such an one. We thought if her sex used the wires, women might be employed to convey by her dexterous fingers the messages of her sisterhood. Even so. There is no objection.

Can you preserve the business of an office confidentially? we ventured to ask, almost ashamed at the asking.

The answering toe as it beat upon the floor in a few successive raps, and a rather chirp "yes, sir," and a little toss of her Pennsylvania bonnet, was answer enough.

We soliloquized further. Here are a number of young men scattered along at different points throughout the State. Some are by nature rude, some may easily acquire it. The presence of a gentle woman calms down man's coarseness. The lips even of a brute are quiet in her presence. Profanity ceases the instant she appears. Now we have it. This lady will be appointed. By her presence on the wire she will secure to all respect, rudeness will be made impossible, the line will acquire character. This decided the appointment. It accomplished all we desired.

Since then we have made a few similar appointments. Others have widened the door still more. In New York Gen. Lefferts opened for them a free school for practical instruction in the art, which should still be open and must be again. Now there are ladies performing their several duties promptly and acceptably all over the land. Even on the N. Y. Central Railroad, where our appointment of a poor anxious unfriended Canadian girl, caused infinite consternation, and who, as soon as we left control, was hustled from her post by a *gentle* superintendent, has appointed ladies in almost all its offices.

And so in other occupations, in printing, in engraving, in photography, in painting, 25,000 women in New York alone earn a comfortable livelihood. They are more acceptable than men in many departments and are preferred. From the bindery at \$6 per week to the engraving room at \$20—and at the telegraph office with salaries varying from \$500 to \$1,320 per annum, it has been proven that woman can perform highly acceptable labor and of the most various character. If she has, as we sometimes fear she has, lost by the rude contacts of toil somewhat of her gentleness, she still preserves that womanliness which society cannot lose without danger to all its best and noblest aspirations.

### Government and the Telegraph.

We see that Mr. Washburne is determined to introduce his measure for the assumption by the Government of the Telegraph system of the country. Nothing is more preposterous and impracticable. To punish a "gigantic monopoly" which Mr. Washburne conjures up to his mind as the "sum of all villainies," he would establish the most repulsive of all monopolies, a political machine in the hands of a dominant party to carry on the telegraph inter-communication of the American people. No fitness for position would make an operator secure in his position, but the key would be taken from worth and skill and put into the hands of shysters and political runners, who would soon so degrade the system as to force it back to the care of the people in whose hands it had better remain. When the Government can show that merit regulates its appointments, that the appointment of the Postmasters, into whose hands the Telegraph system would be placed, is made upon simple worthiness and capacity, when we have any reason for believing that Government would give facilities even equal to those now provided by private companies to our citizens, then we may assent to its proposed assumption of the lines of the country. But with all our love of our institutions, with due respect for those over us, we think Government had better show its ability to perform its present legitimate duties in the great work of ridding the country of its debts, and leave the telegraphs to those who own them. In private hands all evils will, in time, be removed by the united pressure of self-interest and the public necessities.

We direct attention to Mr. Bishop's circular on the following page, and regret we cannot further refer to it in this issue.

### Prodigious!

[Correspondence of the New York Evening Post.]

The Chicago correspondence of the New York *Evening Post* has the following precious paragraph:

"The Western Union Telegraph Company operates some ninety thousand miles of lines, and has become a vastly wealthy corporation, its total capital now reaching over \$40,000,000, and its \$100 share being worth \$266 66.

That man has immense faith in the value of Western Union stock! It is part, however, of an argument for building opposition lines; and like most of such articles, deals largely in imaginative results.

### Great Britain—The British Electric Telegraph.

The bill now before Parliament recites that the means of communication by telegraph in the United Kingdom are insufficient, and many important districts are without any such means, and that it would be attended with great advantage to the State, to trade, and to the public generally, if a cheaper, more widely-extended, and more expeditious system of telegraphy were established. The bill proceeds to give power to the Postmaster-General to purchase existing telegraphs by agreement, a company to be bound by two-thirds of the votes of shareholders present in person or by proxy at a special meeting. But when the Postmaster-General thus acquires the undertaking of one company, he is to be bound for twelve months (if required) to purchase that of any other company upon terms to be settled (failing agreement) by an arbitrator to be appointed by the Board of Trade; and this clause includes railway companies possessed of a telegraph open to the public on the 1st of January last, and railway companies possessing any beneficial interest in such telegraph may in like manner require the purchase of their interest. The Post-office is to charge a uniform rate for transmission of messages throughout the United Kingdom without regard to distance, the rate not to exceed 1s. for twenty words, and 6d. for every additional ten—names and addresses of senders and receivers not to be counted, and the above charge to cover the cost of delivery by special foot messenger within one mile of the terminal office, or within its town postal delivery if it is a head office, and that delivery extends not more than a mile from it. When the addressee does not reside within these limits, the message will be delivered free of charge by the next postal delivery, or, if the sender desires, by a special foot messenger at a charge for portage beyond such limits not exceeding six pence per double mile. The payments for telegrams, except for portage, are to be made in stamps. The Postmaster-General may arrange that messages (with the stamps) may be deposited in pillar letter-boxes, the telegrams to be despatched forthwith on their arrival with the letters at the postal telegraph-office. No purchase of a telegraph is to be binding until the agreement, with a statement of reasons for it, has laid for one month on the table of both Houses of Parliament without disapproval.

Mr. W. T. SCHEIDE, Civil Engineer of Philadelphia, designs soon commencing a course of lectures on Electro-chemistry and Electro-engineering, of which we will have more to say in another number.

We take pleasure in introducing to the fraternity our new correspondent at St. Louis under his nom de plume, "Voyageur." He begins the service well, without jingle of phrases, but with sense and heartiness, giving us all glimpses of the great West, on the eastern edge of which he performs his duties. In Voyageur's private note, which is amazingly brief and to the point, he says: "If you like me I will call again." Well, that is frank and Western-like. We will be equally frank and confess that we rather take to you; think you are some, and would be glad to have you come in as often as may be agreeable to you. Here is our hand. The latch-string is outside.

## MONTHLY STATEMENT.

Western Union Telegraph Company.

MARCH.

Receipts	\$587,962.23
Expenses	335,947.65
Net profits	\$252,014.58

## Comparative Quarterly Statement.

JANUARY 1 TO APRIL 1.

	Receipts.	Expenses.	Net Profits.
1867—	\$1,594,644.96	\$952,798.56	\$641,846.40
1868—	1,727,939.55	1,048,249.19	679,690.36
Increase,			\$87,843.96

WE are requested to say that as the circulars of the Western Union Telegraph Company are now published only in the JOURNAL OF THE TELEGRAPH, every office is required to preserve the copy sent to it as the property of that Company. Failures to receive should be reported to the District Superintendent.

Our correspondent at Chillicothe, O., must excuse us if we withhold his article from publication. The revenge so quietly taken was merited and severe. The sketch is readable and suggestive. It is a sad lesson of dissipation. But the use of the terms employed in the drunken complimentary are such as we desire to prevent appearing even in an otherwise acceptable article.

On the back of a document recently received, is the following memorandum:

"Can't you give us the experience of the Superintendent who, in early days, attempted to show the wonders of the telegraph to Gov. Shunk, of Pennsylvania, and his staff, while the operator at Lancaster held his key open? A. S."

Yes, we so design. We will begin at the beginning of our telegraph experience, however. It must be done from memory. The history of the early days is not without interest. A diary of that period would be valuable now. In another number we will begin a chapter of memories. Wish we had room enough to write freely. There is not much opportunity for gossip in an eight-page quarto, and some things won't bear condensation. But we will do the best we can.

M. Gerard has discovered a very curious fact. If a metallic ring made of wire, the diameter of which varies regularly, so that at one side of the ring it is very thin and the other side relatively very thick, be suspended over an electro magnet, it will begin to revolve. M. Gerard sees in this fact a new system of telegraphy.—*New York Citizen.*

In the Court of General Sessions, yesterday, before Recorder Hackett, Wm. Roche, an operator of the Franklin Telegraph Company, indicted for divulging a telegraph message to John Sammond, a broker in Wall street, the facts concerning which were published some time ago, was before the Court on the demurrer filed by his counsel. After the argument on both sides had been made, the Court gave judgment against the defendant, with liberty for him to plead over. He pleaded not guilty.

**SIGNALS ON SHIPS.**—Telegraphic signals are now designed for use on shipboard. On a naval steamer, a circular dial, with movable hands and indicatory words, is fitted on deck; a similar dial is placed in the engine-room, or on the gun-deck, or at the rudder, each connected by metallic air-tubes with the one on deck. The officer wishing to give an order turns a handle fitted in the side of the dial by which he stands, and instantly the same signal appears on the steersman's dial, and he obeys the order. In the same way the captain may send his commands to the captains of the guns, or to the engine-room.

## TARIFF BUREAU.

Semi-Monthly Circular.

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
May 1, 1868.

To all Offices on W. U. Lines—

Please note the following changes, which have occurred since April 16th, the date of the last Tariff Order, in your Tariff Book:

## NEW OFFICES.

East Wallingford, Vt., tariff same as Cuttingsville, Vt.  
Tully, N. Y., tariff same as Homer, N. Y.  
Newport, N. Y., tariff 10 and 1 more than to Herkimer, N. Y.  
North Islip, L. I., tariff same as Thompson, L. I.

## OFFICES OPENED ON OTHER LINES.

Steamboat Station, Pa., tariff 30 and 3 from Philadelphia.  
Check Philadelphia.  
Richville, N. Y., 35 and 3 from Oswego, N. Y. Check Oswego.  
Norfolk, N. Y., 65 and 4 from Oswego, N. Y. Check Oswego.

## OFFICES CLOSED.

Christiana, Tenn., Moreau, N. Y., Ogden, Utah, Thompson, L. I.

## GENERAL INFORMATION.

In the last Circular for Columbia, Ala., read Columbiana, Ala. Tariff to Lime Kiln, Ala., 2.50 from Louisville and 2.50 from Washington. Berlin, N. J., is the new name for "Long-a-Coming, N. J."

Offices having "Special Sheet A" will check Norristown, Pa., at 30 cents more than Philadelphia, Pa., and Brewsters, N. Y., at same rate as Pawlings, N. Y., on and after May 5th, 1868, unless they have been otherwise ordered.

WILLIAM ORTON,  
President.

JAMES JONES, Cable Watchman for the Western Union Telegraph Company, residing on 10th avenue near the foot of 15th Street, fell from the window of his bedroom in the third story while in a state of somnambulism. The accident took place about 2 A.M. on Sunday morning last, and on being picked up he stated that he saw a vessel casting anchor over the Cable, and supposed himself on his way to prevent it. He died of his injuries at 4 A.M. 2 hours after his fall. Deceased was a very faithful sober man, about 55 years of age, and has served nearly 20 years. He leaves a wife and several children.

**THE LIBRARY OF THE CORNELL UNIVERSITY.**—Information has reached this country that the bid made by the Hon. Andrew D. White, in behalf of the Cornell University, for the library of Professor Bopp of Berlin, has been accepted. The splendid collection of this distinguished philologist, probably the best collection ever made in philology, will soon be on the shelves of the Cornell University.

## MARRIED.

In Rochester, N. Y., April 28th, by Rev. Dr. Robinson, Mr. Alonzo R. Clarkson to Miss Lizzie F. Reid, both of that city.

## BISHOP'S TELEGRAPH ROOMS,

113 LIBERTY STREET, NEW YORK.

TO MANUFACTURERS OF TELEGRAPHS AND ELECTRIC INSTRUMENTS AND APPARATUS:

I design opening Rooms in the building now occupied by the BISHOP GUTTA-PERCHA COMPANY, No. 113 Liberty street, N. Y. City, for the Reception and Exhibition of every kind of

## TELEGRAPH AND ELECTRIC APPARATUS.

to be kept open Every Day, and properly attended to, and the articles on exhibition taken care of by me.

I invite you to send me any articles of your manufacture, properly labeled, with name and price at which you sell them.

The charge for space and care of Instruments, etc., will be ten per cent. of their marked saleable price for the year.

Insurance, if required, will be charged extra.

Exhibitors will at all times be admitted to the Rooms with their customers to show samples, and sell from them, free of charge.

N. B.—Battery power will be supplied for testing, etc.

Respectfully,

SAMUEL O. BISHOP.

New York, May 1st, 1868.

## WANTED.

A Situation in a Telegraph Office by a FIRST-CLASS PAPER OPERATOR.

Address—

P. O. Box 72, HART'S FALLS,

New York.

## TREASURER'S OFFICE.

WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
April 25, 1868.

To OFFICE MANAGERS:

Hereafter, and until further notice

the following offices only will report weekly gross receipts, viz:

Atlanta, Ga.  
Augusta, "  
Albany, N. Y.  
Austin, Nev.  
Auburn, N. Y.  
Akron, O.

Williamsport, Pa.  
Zanesville, O.

The report must be sent directly to the Treasurer, at the close of the week's business, as soon as practicable after the result is ascertained, and the lines can be used without prejudice to commercial business.

The report will be in the following form:

"To O. H. Palmer,  
New York.  
Week ending ——— \$ ———  
Manager."  
O. H. PALMER,  
Treasurer.

## MEMORIES.

## The Fruits of Disobedience.

MR. EDITOR: Did you ever read "The Devil on two Sticks?" And if you did, did it not occur to you what a splendid hand the author would be to get astride of one of our wires—say a way wire on some of our prominent railways—and travel along incog., taking notes as he went? And who is there, that has passed any length of time on a telegraph line, that could not furnish material enough for half a dozen novels? As I trace back events into the dim past, taking that slender and seemingly insignificant wire, stretched on a few sticks along the road, as a clue, what a variety of scenes appear; some ludicrous, some pathetic, and some vividly awful in their horrible details. One in particular I will never forget. I had been at the scene of a terrible "railroad accident" (nobody to blame, *of course*), where fifty-eight human emigrants met their death by their train rushing, at full speed, into an open draw-bridge. While returning with a train of wounded survivors, we found on a seat, in one corner of the car, a little girl about two years old, with her head bough up in consequence of bruises received at the accident. She was looking wistfully around, evidently longing to see a familiar face. Upon further enquiry we ascertained that her relatives, consisting of father, mother, three brothers and one sister, *all* lay in that awful funeral pile of broken cars, mangled bodies, and the crushed hopes of many a sorrowing parent and child. And there sat the survivor, hatless, frockless, shoeless, and wounded. She looked up at us with a wistful smile, as if she still had full faith in the protecting power of an almighty Providence. But,

"Was it not pitiful,  
In a whole world full,  
Friend she had none?"

It is a remarkable fact that the man who was the direct cause of the accident, the engine driver, passed, apparently, through more danger, and made the narrowest escape of any person on the train. He was on his engine when it went down, went to the bottom with it, and in some way—how he cannot tell—came to the surface, and reached the shore *unharmed*. That he reached the bottom was certain, for his clothing was filled with sand and gravel from the bed of the river. If that man has a conscience, how fearful must his punishment be. The memory of that one lone, desolate child might well blacken his life evermore.

The cause of this accident was the neglect of a rule which was generally considered trifling, and of no importance. It was, that every train should come to a dead stop before passing the draw-bridge. But it had been violated so often, even with the Superintendent's knowledge, that it had become almost a dead letter. I think all of us, but more particularly those employed on railway lines, cannot be too particular to carry out to the letter every rule given for our guidance; as the infraction of some of those rules may *possibly* cause loss of life or limb, or both.

By the way, Mr. Editor, in No. 3 you say a new system has been introduced, namely, telegraphing the sales of the Stock Board to all who have introduced it into their offices, on plain printed slips, and promised us a full description of the process. As this is a decided advance in the art, I am sure all your readers will feel thankful if you will carry out the promise.

Fredk. Md., April 16, 1868.

## The Paris Exposition Awards.

The medals and diplomas awarded to American exhibitors at the Paris Exposition arrived in Washington on the 12th instant, and are now on exhibition in the hall formerly occupied by the House of Representatives. The cases containing the medals were placed in position last Tuesday. They were forwarded from Paris, and are beautiful specimens of

workmanship, being composed of French glass, supported by a frame-work of burnished steel, and mounted on tables covered with rich velvet dropping to the floor in graceful festoons. From the corners of each table is suspended a heavy fringed tassel. The cases contain 192 objects of interest, comprising

4 Crosses of the Legion of Honor,  
3 Grand Prizes,  
15 Gold Medals,  
1 Artist's Medal,  
74 Silver Medals,  
95 Bronze Medals, and 1 Statuette, which is placed over the cases.

In addition to the medals, there are now some two hundred diplomas. These are suspended three rows deep, on upright screens of about seven feet square, which are placed in such a manner as to form a series of alcoves extending around the entire hall. Along the top of these alcoves flags are tastefully arranged, and over the entire alcove the coat of arms of the United States is placed. There is also a series of photographic views, which will occupy a horizontal line of twenty-four feet, forming, as it were, a panoramic view of the part occupied by the United States in the Exhibition.

The following exhibits the percentage of awards to exhibitors from four prominent countries:

France	55.37
United States	52.79
Germany	47.50
Great Britain	26.10

The only award of a telegraphic character, was one grand prize and diploma to Mr. Hughes, which was delivered to him in Paris.

## How to Shave Without a Razor.

In looking over some English patents, we came across the following amusing document, to which we suppose the Great Seal of the realm, consisting of a pound of beeswax, was attached, by means of red tape, in the usual manner. The inventor ought to have included the right to clean hogs before killing, in this manner:

*Specification of the Patent granted to Marcus Hymans, of Exeter street, Covent Garden, in the county of Middlesex, England, for a Composition for Shaving without the Use of Razor, Soap, or Water. Dated February 7, 1864.*

To all to whom these presents shall come, etc. Now know ye, that in compliance with the said provisions, I, the said Marcus Hymans, do hereby declare that the same composition for shaving, as aforesaid, is prepared and used in the manner following—that is to say: Mix one pint and a half of clear lime-water, two ounces of gum-arabic, half an ounce of isinglass, an eighth of an ounce of cochineal, a quarter of an ounce of turmeric-root (made into powder), an eighth of an ounce of roach-allum, an eighth of an ounce of salt of tartar, and an eighth of an ounce of cream of tartar, together; boil them for one hour at least (stirring up the mixture during the whole time of boiling, and being careful not to let it boil over), clear it through a sieve; then add two pounds and a half of iron pumice-stone, finely pulverized, mix the whole together with the hands into one cake, by the assistance of the white of two eggs well stirred up. Then divide the cake, so made, into twelve small cakes; dry them in the open air for three days; put them into an oven of moderate heat for twenty-four hours, when they will be completely dry and fit for use. Apply them with a gentle friction to the beard, and they will produce the complete effect of shaving.

In witness whereof, etc.

DURING the germination of seeds and the growth of plants, negative electricity is generated and becomes free in air. Pouillet has estimated that a surface of 100 square yards covered with vegetation, disengages in a day more electricity than is required to charge the most powerful Leyden Battery.

**A Parisian Romance.**

One of those little romances of which the French are so fond has lately taken place in Paris, and is thus described in a French journal:

M. Robert, an immensely wealthy and highly accomplished gentleman, well known not only for his valuable collections of paintings and mediæval relics, but for his rare skill as a designer and painter, hearing that one of his tenants, a Mr. B., whom he had never seen, kept one of the most extensive ateliers of fancy boxes and ornamented objects in France, called on him with a view to make his acquaintance.

Entering the counting-room he found a good natured, eccentric gentleman of middle age, who greeted him, and exclaimed:

"I suppose that you also have seen my advertisement, and have come to apply for that situation as designer?"

For a joke M. Robert replied that he had. Mr. B. supplied him with paints and brushes, and requested him to produce a design for a casket. M. Robert soon found out what Mr. B. really wanted was an artist who would strictly carry out his own ideas, and that these were pure, and formed on an extensive knowledge of art. In a short time he produced a sketch which suited the employer to a dot.

M. Robert very gravely engaged himself, exacted good wages, and insisted on having several new articles of furniture placed in the room which was assigned him. But when he was introduced to the workrooms, and found one hundred and fifty girls, many of them young and beautiful, busily employed, and was informed that he would be required to supply them with designs, and show the young ladies how they were to be carried out, the young artist began to feel as if he should have to be carried out himself, being very susceptible.

"Working for a living," said he to himself, "is not entirely devoid of attractions. Let us work."

Mr. Robert, being an accomplished artist, delighted his employer, and the former soon found a remarkable fascination in seeing his designs realized in steel, silver, enamel or wood. He took a pleasure hitherto unknown in seeing his works in shop windows and finding them in the *boudoirs* of his friends. This workshop life was, of course, carefully concealed from "society," nor did his employer suspect that his artist was his landlord. But M. Robert soon found a more intense object of fascination in the daughter of Mr. B., a young lady who also took part in the duties of the *atelier*. This damsel was as remarkable for her accomplishments as for her extraordinary beauty; and M. Robert soon found that, as regarded taste and culture in all matters which specially interested him, he had never met with any one like her. Step by step the pair fell in love; and little by little the artist so ingratiated himself with the father that, after due deliberation, he consented to their union.

Previous to the marriage the old gentleman one day spoke of a dowry. "I shall give Marie fifty thousand francs," said he, with a little air of boasting.

"And I suppose," said M. Robert, gravely, "that I, too, must settle something on my wife. Well, I will."

This caused a peal of laughter, which was redoubled when the artist added:

"And I will settle this piece of property, house and all, with the building adjoining, on her."

But what was their amazement when the artist drew forth the title deeds, and said:

"You seem to forget that I am your landlord. Isn't my name Robert?"

The young lady did not faint, but papa nearly died of astonishment and joy. There was a magnificent wedding, but the bridegroom has not given up business. He declares that there is as much amusement in being useful as in amusing one's self.

**Telegraphers'****Mutual Life Insurance Association.**

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

J. D. REID, Treasurer.

**DIRECTIONS TO APPLICANTS.**

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

Keeps constantly on hand and for sale his

IMPROVED TELEGRAPH INSTRUMENTS.

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed. His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them. Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1885. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

## PRICES.

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	18 00
Main Sounders, same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	4 50 to 6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire in the pound. Goods sent to all parts of the continent with full C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for postage.

He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers prices.

## Anticipations of the Twentieth Century.

Tell John to put the kettle on  
I mean to take a drive,  
I only want to go to Rome  
And shall be back by five.

Tell cook to dress those humming birds  
I shot in Mexico:

\* They've now been killed at least two days  
They'll be *un peu trop chaud*.

I'll try that wine, too, a la rose,  
Just brought from Ispahan:  
How could those Goths of other times  
Endure that vile champagne?

The trip I took the other day,  
To breakfast in the moon,  
Thanks to that awkward Lord Bellaire  
Has spoiled my new balloon.

For, steering through the Milky Way  
He ran against a star,  
And turning round again too soon  
Came jolt against my car.

Such fellows ought to keep below  
And never venture there;  
If he's so clumsy, he should go  
By no way but the Bear.

My steam is surely up by now  
Put the high pressure on;  
Give me the "Breath Bag" for the way  
All right—hey—whiz—I'm gone.

LORD STANLEY said recently that he wished he could talk over the question of the Alabama claims with Mr. Seward personally—he thought that in this way the whole affair might soon be settled. We imagine he came very near to his wish one day last week. When Mr. Seward was in this city, it happened that the British Minister, Mr. Thornton, was also here, and it also happened, we understand, that a dispatch came by cable from Lord Stanley through Mr. Thornton to Mr. Seward, to which Mr. Seward promptly replied—after which further telegraphic dispatches were interchanged. It is possible that they were on some other subject than the Alabama claims; but we don't see why the two distinguished diplomats might not exchange photographs, and then with the picture of each before the other, carry on a lively conversation through the cable. It would be no worse than having to resort to the ear-trumpets which many old gentlemen are compelled to use

## Barker's Electric Organ.

M. Barker, organ builder, Paris, has just patented, in France and England, a complete system for applying electricity to supersede the ordinary mechanical key and draw-stop action in large organs. The patentee has already built a grand electric organ of forty-two sounding stops and eight couplers for St. Augustine, Paris, and another for Salon, near Marseilles. As the largest organs may now be played through a cable of insulated wires, positions hitherto wholly impracticable can be turned to account. The organist, with his various claviars, can be placed in any direction and at any distance away from the organ, the touch being equally delicate and rapid on every manual whether used separately or coupled.—*American Artisan.*

## SPEED TEST.

### Fastest Time on Record.

We have received from Mr. H. P. Burns, night operator of the Western Union Telegraph Company at Boston, the evidences of transmission of matter from Boston to Providence, R. I., on the night of May 8th, between the hours of 9 and 10, which, for rapidity, has, so far, no superior in any test yet made by the Morse machinery. In this test, Mr. Burns, who holds what is called the "champion key" for superiority as a rapid transmitter, was the sender of the matter in question, which consisted of 2,731 words from the sixth chapter of Gulliver's Travels, and which he sent in one hour, or 100 words more than the best recorded time as accomplished by Mr. E. M. Shape, of Cleveland, O., to Mr. E. Curry, of St. Paul, Minnesota. The manuscript of the receiver, Mr. Walter P. Phillips of the Western Union Telegraph Company's Office at Providence is before us as we write, and is remarkable for its clearness and legibility. We notice only one word in the entire message which required correction.

In such a test as this, it is difficult to say who is entitled to the most credit, the sender or the receiver. The labor of the receiver is, in some respects, the greatest. His attention has to be extreme. The combination of dots and dashes rushed rapidly together requires the utmost care to render the separate letters correctly. Throughout the whole hour of the reception of this message, Mr. Burns had to make 20 motions of his fingers, and Mr. Phillips 9 strokes of his pen per second. We cheerfully congratulate these gentlemen on their success, and while Mr. Burns must, by general consent, remain the undisputed owner of the golden key, we think Mr. Phillips should be awarded, with equal unanimity, a golden pen. We shall be disappointed if Prof. Morse, whom we expect daily, is not, himself, the first to present it. He has written us requesting the names of all engaged in these tests, which are exceedingly gratifying to him, as they are to us.

The following certificates accompany the original manuscript of the transmitted message:

OFFICE OF THE BOSTON JOURNAL,  
BOSTON, May 7, 1868.

Mr. P. H. Burns:

Dear Sir—The original of your message of twenty-seven hundred and thirty-one words, sent hence by you last night, within one hour, to Mr. Walter Phillips of Providence, has been examined by me, and I am free to say that it would constitute what I consider, taking the average quality of telegraphic dispatches, excellent copy for the printer. We are very fortunate, as you know, in having good copyists connected with the Associated Press, which fact enhances the comparative merit of your work and that of Mr. Phillips. Congratulating you on the fame which your recent feat has added to what has already been assigned you, I am, dear sir, yours, very truly,

JOHN C. MOORE.

OFFICE OF THE BOSTON HERALD,  
BOSTON, May 7, 1868.

Mr. P. H. Burns:

Dear Sir—The copy you sent I think a little superior to the average received direct from operators, so far as spelling and construction of sentences is concerned. Of course there is a lack of punctuation, but aside from this the copy taken in the short space of an hour, is, judging from an experience of many years in revising the same for publication, most excellent.

Yours truly,

C. H. ANDREWS.

OFFICE OF THE BOSTON POST,  
BOSTON, May 7, 1868.

To Mr. P. H. Burns:

Dear Sir—I have examined the original copy taken by Mr. Phillips of Providence, containing 2,731 words, which were received by him from you last evening, and am gratified to state that, in point of legibility and accuracy, the manuscript compares favorably with, and is in many particulars superior to, the average of manifold writing that comes under my eye.

Yours respectfully,  
A. G. HARLOW.

## Correspondence.

### Batteries and their Composition.

To the Editor of The Journal of the Telegraph:

OIL CITY, PA., April 24th, 1868.

SIR: It may be improper in me, after having asked Mr. Varley for information, to criticize the answers he has taken the trouble to give; but as the questions were asked for others as well as myself, I hope I may be justified in accepting such of his statements as appear to be correct, giving my reasons for so believing, and holding myself open to criticism as I criticize him.

In doing this, I shall try to state truths briefly and plainly; not however without the kindest feeling towards Mr. V., for it is natural for men, to both err, and differ in opinion; and if during this argument I should write a word or sentence that sounds harsh, be assured it is a fault of the head and not of the heart.

I am not one of those who deem it necessary to refer to foreign authors to substantiate Scientific Truth: no person in Christendom has better opportunities of observing the laws which govern Voltaic arrangements than an American telegrapher: I shall therefore avoid such references as much as possible, and confine myself to Mr. Varley's statements, and to the answers I have received to questions "propounded to Nature."

On page 2, No. 6 of the Journal, fourth and fifth paragraphs, we are told, "the electric current will cease almost entirely in the course of a very short time, the deposition of hydrogen upon the surface of the copper rendering it almost as positive to the water as the zinc" \* \* \* "but when it becomes fully covered with hydrogen it is thereby rendered temporarily as positive as the zinc, and the current is almost reduced to nothing." That hydrogen is deposited on the Negative plate, and the current is almost reduced to nothing, are facts; but let us see if they are properly explained.

In order that hydrogen may make the surface of the negative plate as positive to the water as the zinc is, the hydrogen must *have* and must *exert* the same affinity for oxygen that the zinc does; that it *has not* got that affinity is proved by the fact that oxygen has just forsaken the hydrogen that annoys us, to unite with the zinc; if it had the affinity it could not *exert* it because the oxygen in the water already has its proportion of hydrogen and can unite with no more: consequently the negative plate cannot thereby be made as positive to the water as the zinc, and we must account for the decrease of current in some other way—it is easily done.

Hydrogen is not a conductor of electricity; and

when the negative plate is "fully covered" with it, it is simply *insulated* from the water and the current necessarily ceases.

The sixth paragraph is correct; but it does not compare favorably with the ninth, nor with his answer to my question, "Is there not an affinity between hydrogen and sulphate of copper?"

The first part of the seventh paragraph requires our attention. Neither the rule nor example can apply to the Daniel's battery: admitting for the sake of brevity that those metals, when placed in *water* do produce results as he states; can we expect the same results under different circumstances, the one in water, the other in a solution of sulphate of copper? the last named compound is already saturated with copper and has no disposition to acquire more: it is passive to the copper plate, and it makes no difference (as I shall hereafter show), what affinity the negative plate may have for oxygen, so long as that affinity is not exerted. Mr. V. supports this statement when he says, in answer to my question, "If the platinum plate be immersed in sulphate of copper no increase of power will result."

The copper plate in the Daniel's battery is absolutely negative, and according to Mr. Varley's example, would stand—Zinc, Copper battery, 6—0=6.

The few next paragraphs are ably answered by TELEGRAPH OPERATOR, we will pass on to the fifteenth and sixteenth.

"Professor Daniel rested content with his great discovery," as well he might: he like Grove had "propounded the question to Nature" and like Grove, he had received a satisfactory reply; each had "put a material around the negative plate which had a great affinity for hydrogen," and each (if we accept Mr. Varley's theory) had succeeded in getting the sum, instead of the difference between the forces. I regret to find the eighteenth paragraph over Mr. Varley's signature, because much is due to Daniel and Grove, shall we rob Bunson? Is it not possible for "other nations" to make a discovery? Must "other nations" surrender the results of all research because Daniel and Grove have made brilliant discoveries? Though Mr. Bunson's name does not shine like theirs he has added much to scientific truth; he demonstrated the fact that *coke*, a material which has a strong affinity for oxygen, may under favorable circumstances serve as well for a negative plate, as the metals which have the least affinity for oxygen, and he should have the credit of it.

In the twenty-second paragraph we are told, "in the nitric acid form of Grove's battery, (nitric acid is always used in *Grove's* battery)," on passing the current through a small external resistance, the power after the lapse of a minute or more actually increases considerably in volume."

The above is correct; now let us compare it with the seventh verse in his letter on page 2, of No. 8. "On closing the circuit, hydrogen is observed on the surface of the platinum, which, combining with the oxygen of the nitric acid, produces a film of water partially separating the platinum from the nitric acid, and therefore a somewhat similar result is obtained to that of using dilute nitric acid. The amount of water produced (he should have added, *in a given time*) varies with the amount of work the battery is performing."

If we except both of these statements, we must believe the current will increase in volume as the nitric acid becomes diluted. Now if the current is passed "through a small external resistance," in other words through what we used to call a "*short surcuit*," the battery performs more work and water is produced more rapidly. Upon this theory, we might reasonably expect the current would go on increasing in volume indefinitely.

The latter statement contains an error: on closing

the circuit, hydrogen is evolved by the decomposition of water, but it unites with the oxygen of the nitric acid immediately upon coming in contact with it and produces a film of water on the inside surface of the porous cup and *not* on the platinum: had he said, the film of water was produced on the surface of the negative plate, I think he would have been correct, for I believe he will yet be convinced that when the Grove battery is newly filled, *the surface of the nitric acid acts as the negative plate* and the platinum only as a conductor, and continues so until at least one equivalent of the oxygen in the acid is exhausted.

There are several errors in the balance of his letter, but to answer them in detail would occupy too much space in your valuable little Journal; I will make them the subject of a future communication.

I now propose to refer briefly to the substance of the questions asked in my former letter, and to assert them as facts, together with the answers I have received to "questions propounded to nature," and, confidently believing they can be sustained, I invite debate to prove them false.

There is, in all Voltaic arrangements, a reverse law analogous to the laws of Electro-Magnetism and Magneto-Electricity! That law is, as a current of electricity will decompose compounds, so will the decomposition of compounds (if conductors are properly arranged) produce a current of electricity.

The production of electricity in all known forms of Voltaic batteries is the immediate result of decomposition.

The *intensity* is always in proportion to the affinity which either element of the compound decomposed, may have for the material which excites decomposition, minus the affinity between the elements which form the compound, and the *quantity* is in proportion to the amount of that compound decomposed.

To illustrate—the intensity of the Smee's battery is in proportion to the affinity of oxygen for zinc, minus the affinity of oxygen for copper, and the quantity is in proportion to the amount of oxide of copper decomposed.

In the Daniel's battery the intensity is in proportion to the affinity of oxygen for zinc, minus the affinity of oxygen for copper, and the quantity is in proportion to the amount of oxide of copper decomposed.

In the Grove battery the intensity is in proportion to the affinity of oxygen for zinc, minus the affinity of oxygen for nitrogen, and the quantity is in proportion to the amount of nitric acid decomposed: in all the above named batteries, zinc only acts as a material to excite decomposition and as a conductor.

If greater intensity is wanted in either of these batteries it can be obtained by replacing the zinc with any conductor of electricity which has (under the same circumstances) a greater affinity for oxygen. Take for example, Sodium: the intensity will be found in proportion to the affinity of oxygen for sodium minus the affinity of oxygen for hydrogen, copper or nitrogen, and the quantity will be as before, in proportion to the amount of water, oxide of copper, or nitric acid decomposed.

Basing experiments (questions to nature) upon this theory, I have received a reply which establishes its correctness beyond question: *I have obtained a current of electricity by the decomposition of a carbonated alkali without the acid of any metal or material which has an affinity for oxygen.*

Accepting Mr. Varley's rebuke in relation to anonymous correspondence, I now give him my real name.

Yours, &c., D. H. FITCH,  
alias INVENTUS.

FORT KEARNEY, Neb., April 9, 1868.

To the Editor Journal of the Telegraph:

DEAR SIR—In the JOURNAL OF THE TELEGRAPH of January 15, and also in the *Tribune* and other

papers, I see that efforts are being made to place the telegraph under the control of the Government. Mr. Washburn, of Illinois, is the main mover, and is urging the adoption of a bill in Congress with the above-named object in view.

This is a question of great importance to every employee of the telegraph companies in the United States, superintendents, agents, operators, all are interested, and all, I think, are opposed to any such movement. One of the main arguments in support of the bill is, that tariffs would be reduced, on that account the telegraph would be used more than ever, and it would be placed within the reach of every one, become, in fact, so common that the laboring man and capitalist would alike use it for a common carrier instead of the mail. They complain now that it is a monopoly. Perhaps the tariffs would be reduced, and I presume our Senators and Congressmen would reduce them so as to frank all *their* messages, and use the telegraph as they now use the mail, and make the unfortunate wires a carrier of more nonsense than ever passed over them before, of no use to any one, and of no earthly consequence whatever. I presume these same Senators and Congressmen so anxious to control our telegraph lines, would give passes to their political friends, and allow them, also, to send their messages free. One thing is certain, it would immediately be turned into a great political power, precisely the same as our mail system now is. The superintendents, the managers of the larger offices, the most important positions would not be filled by the most competent persons, by those that had labored long and faithfully for the companies, by practical operators—but by political favorites, men who, perhaps, know nothing about the business, and would probably be found anywhere but in their offices after their appointment at big salaries. It is very plain to see how our postmasters are appointed, and why. Just the same way would be the working of the telegraph if under Government control—the ability and suitability of the appointments would be secondary considerations. Again, once in two or four or six or eight years, every time a great political change would be made, then a great change would be made among telegraph officers, and telegraphers and postmasters would be running around minus their political heads, and a most sorrowful-looking set they would be, too. Another very interesting item to operators: two or three times a year a tax would be levied on all employees by the dominant party—a certain per centage on their salaries; perhaps the tax would amount to \$25 or \$50 a year. Everybody in the employ of the company, from superintendent down, same as it now is in our post-offices from postmaster down, all would be included—and woe to the poor unfortunate who does not "shell out" at these times.

The art we now take so much pride in would be debased by "the party in power," to assist them, and instead of returning a handsome premium on the capital invested, as it now does, it would pay but very little, perhaps nothing, and might even cost the Government something to run it, as our mail now does in certain portions of the United States.

Mr. Washburn speaks of the Western Union Company as a monopoly. As well might it be claimed that our principal railroads are monopolies, and should be under the control of Government. The Union Pacific Railroad, the Atlantic and Great Western, the Illinois Central, the Camden and Amboy that *does* control New Jersey, or those roads Vanderbilt carries in his pocket—why are not the Hon. members exercised about these monopolies? Or our principal lines of steamers, our express companies, the American, Merchants' Union, United States, Adams, Wells, Fargo & Co.—these, mayhap, are in danger of becoming monopolies. Where would Mr. Washburn like to stop? Must the Gov-

ernment control everything? There are many powerful companies in the United States, besides the Western Union Telegraph Company, in danger of becoming monopolies.

I think every employee of the telegraph should oppose this measure with all his power. We all know what the sentiments of the JOURNAL are. The same number in which it mentions Mr. Washburn's bill, contains the following: "Once take from popular management the pursuits which give vigor to our national life, and place them in the hands of government officials, then farewell to the enterprise which stimulates and distinguishes us as a people."

In proof of this "enterprise," I will enquire if "government officials" had had the management of our telegraph lines, would the Atlantic Cable have been working successfully now? Would the effort ever have been made, in the extreme north, of building "Collin's Overland?" I question if ever this line—originally known as the "Pacific Telegraph Line"—would have been built yet; and if it had, it would have been at an additional expense of two or three times what it did cost, for government never can do any work as cheap as individuals or incorporated companies, nor as well.

May the day be far distant when this change is made, and the government controls our telegraph lines.

JOHN W. FORD.

WE are indebted to Mr. Cromwell Fleetwood Varley, the celebrated English electrician, for showing us to what a wonderful extent rapidity in telegraphic transmission can be carried. Mr. Varley's visit to this country a few months since was made with the view of causing the American Morse alphabet to be abandoned, and the English Morse alphabet substituted in its place. He claimed that of the two the English alphabet was the better one, and inasmuch as the use of one alphabet by the whole world must ultimately result, Mr. Varley sought to accomplish the adoption of the English alphabet in America, the only country where it is not already in use. When his intention was made known, tests of speed were immediately made to show that worthy gentleman that such an arrangement would prove an extremely poor speculation for America. Before he left this country it was shown him that we could transmit two words by our system while one was transmitted by his; so Mr. Varley went home with his object unaccomplished.—*Providence Journal*.

Mr. Varley came with no such purpose except to show the advantage of some changes in the Morse alphabet which had no reference to speed of transmission, but for the avoidance of error. The provision of the paper exhibiting this supposed advantage was a simple contribution to the *Journal*. Speed by the one alphabet is just as attainable as by the other, one or two letters excepted.

#### New Electrical Batteries.

M. Balsamo has presented to the French Academy a battery, both elements of which consist of iron, the one being immersed in a solution of chloride of calcium, the other in diluted sulphuric acid, the two solutions being separated by a porous cell. The iron in the sulphuric acid acted as the positive element, and the other as negative. A constant and quite an intense current is obtained by this arrangement. Another novel battery, termed an "electric buoy," is now being experimented upon at Cherbourg. It consists of a zinc plate and a cylinder of carbon, attached to a cross piece of wood, having sea water as an exciting liquid. Still another variety is that of M. Miergue, of Bonfarik, consisting of a cylindrical cell of porous carbon, containing nitric acid, and an exterior cylinder of amalgamated zinc in a cell full of water.

Applications for insurance have increased of late, but they should be more numerous.

#### Patent Granted.

BY SPECIAL ACT OF CONGRESS.

INDUCTION-COIL APPARATUS AND CIRCUIT-BREAKER.—Charles Grafton Page, Washington, D. C.

I claim, 1. An induction-coil apparatus, consisting of a primary and secondary circuit, when said secondary circuit is many times, that is to say, two, three, or more times the length of the primary circuit, having the connections so arranged that shocks, sparks, and electrostatic results may be obtained from the secondary circuit alone, or from the combined primary and secondary circuits, or from the primary alone, or from portions of either circuit, substantially as set forth.

2. The combination of an automatic circuit-breaker, with either a primary coil alone, or a primary and secondary coil combined, substantially as set forth.

3. The combination of a mechanical circuit-breaker with a primary and secondary coil combined, substantially as set forth.

4. The combination of both a mechanical and automatic circuit-breaker with a primary and secondary coil, combined substantially as set forth.

5. The combination of a primary and secondary coil, enclosing an electro-magnet, with an automatic circuit-breaker, substantially as set forth.

6. The combination of a primary and secondary coil, enclosing a compound or divided electro-magnet, with an adjustable automatic circuit-breaker, substantially as set forth.

7. The combination of a primary and secondary coil, enclosing a compound electro-magnet, with an attached hammer circuit-breaker, substantially as set forth.

8. The spark-arresting circuit-breaker, whether used with a primary coil alone or a primary and secondary combined, substantially as set forth.

9. The spark-arresting circuit-breaker, whether used with a coil or coils, enclosing an electro-magnet, substantially as set forth.

10. The spark-arresting circuit-breaker, whether attached to or independent of the primary or primary and secondary coils, substantially as set forth.

11. The adjustment of the retractile force of an automatic circuit-breaker, substantially as set forth.

12. In combination with such adjustment, adjusting the distance of the hammer or the armature from the pole or poles of the electro-magnet which actuates them, as set forth.

13. Adjusting or regulating the length of vibration of the circuit-breaking bar, by means of a set-screw, or any mechanical equivalent for substantially the same purpose, substantially as herein set forth.

14. The employment of one electro-magnetic instrument to open and close the circuit of another electro-magnetic instrument, using either one battery for both, or separate batteries for each, substantially as set forth.

15. The employment of separate and independent batteries to operate an electro-magnetic circuit-breaker, and the circuit which is broken by it, substantially as set forth.

TELEGRAPH-APPARATUS.—Elisha Gray, Cleveland, Ohio.

I claim, 1. Operating a relay by to-and-fro currents of magneto-electricity, momentarily induced by a disturbance of the main or line-current, in the manner substantially as described.

2. In combination with the receiving-magnet or magnets, the electro-magnetic armature, in which a secondary current is induced on the disturbance of the line-current, substantially as described.

3. In combination with the induction-apparatus, constructed as described, the polarized relay, placed in a short circuit, and operated by induced currents, in the manner and for the purpose as set forth.

4. The arrangement of the magnets B C and B' C', in combination with the magnets D' D', used in the manner and for the purpose substantially described.

#### Foreign.

Translated by Mr. Walter Kenneth Griffin, London, Eng.

At the last semi-annual meeting of the Mediterranean extension Telegraph Company, who hold the cable to the Isle of Malta, the President declared that in consequence of the indemnity promised by the Italian Government having been paid only in part, the dividend would only be declared to shareholders after the entire amount had been received.

England, already bound by seven cables to the European continent (three of which terminate in France), is seeking to secure direct communication with Scandinavia.

A company has been formed at New Castile, with a capital of £100,000 sterling, to lay a submarine cable between the British Isles and the north of Jutland, and also to purchase the cable lately laid between Denmark and Norway. The company estimate that by even charging only 4 francs (72c.) for the entire transit of the cable, the returns would reach the sum of 300,000 francs, or about \$54,000 currency. It is easy to foresee that a direct line would carry all the English correspondence to that part of the continent, as well as produce a decided improvement in the regularity of the Dano-Anglo service, and could also be used with advantage by France and Belgium. We have heard that the company intends combining with the lines to the middle of Europe, and, if so, the Danish and Swedish Governments will, without doubt, encourage an enterprise which will bring to their hands the despatches of England to Russia.

The Minister of Public Works in Italy has prepared a project of reform in the telegraphic service of that country. The tariff for the transmission of despatches to the interior of the kingdom will be sensibly reduced.

At the semi-monthly meeting of the Indian Telegraph Company (Limited), which has been held lately, the Bureau, authorized by the Assembly of 12th July and of the 9th of August last, confirmed the provisional agreement made with the Telegraph Construction and Maintenance Company to give up their line to Egypt, upon payment of 37,500 francs, to be paid at the end of the year commencing the 1st of July last, or 3  $\frac{1}{2}$  ct. upon the capital of 1,250,000 fr. The rents due 31st December, 1867, having been paid, a dividend will be declared of 3  $\frac{1}{2}$  ct. The future of the company depends very much on the success of the Anglo-Indian Telegraph Company, who only wait a favorable occasion to commence the enterprise. M. Sebag has proposed to sell the line to the Egyptian Government, in case the arrangements proposed by the new company should not be carried out.—*Jour. des Telegraphes*.

TELEGRAPH wires were laid down at the back of the high altar in Notre Dame, to receive the Pope's blessing for the Prince Imperial on the occasion of his taking the communion.

CHAMPION TELEGRAPH KEY.—Mr. H. P. Burns, of the Western Union Telegraph Company's line in this city, having held the Champion Telegraph Key of New England and New York eighteen months against all contestants, it has now become his property. It will be remembered that some months ago several closely-contested matches for the possession of this key took place over the Western Union Company's lines, in which extraordinary skill in fast telegraphing was displayed. Out of six of these matches, Mr. Burns came off victorious in five. The champion key, which is made of gold, is to be worn as a breastpin, and is a beautiful piece of workmanship.

The Western Union Telegraph Company have 179 lady clerks and operators in their employ.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 8,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, MAY 15, 1868.

We yield our easy chair to Geo. B. Prescott, Esq., the well known author of the "History, Theory and Practice of the Electric Telegraph," to indite the following article on

### The Telegraph and the Government.

The idea of bringing the telegraph system of the country under the control and administration of the government, has attracted some attention in the United States as well as in the New Dominion; but, as yet, has not been discussed to any great extent. In nearly all European countries, outside of Great Britain, state administration prevails, and in England it is probable that the experiment will be tried of working the telegraph in connection with the post-office department. The argument in favor of this course may be shortly summarized. The telegraph is as much a national boon as the post-office, and government resources would enable a wider communication to be established. High tariffs would be done away with, and such charges adopted as would bring within the sphere of telegraph communication persons now excluded therefrom by heavy charges. The government might make a profit, but would not desire to do so, as it would be an object to enable all to partake of the advantages of the telegraph. Government management would be more economical, as the postal department might be incorporated with a telegraphic department and one set of officials answer for both. Important benefits would be conferred on trade; greater dispatch and stricter accountability would be secured.

Now, interference with private enterprise is dangerous, and the reasons for ousting private enterprise must be undoubtedly good before a government is justified in converting itself into a monopolist. I propose, therefore, to inquire in a general way whether private enterprise has not achieved in the United States, so far as regards telegraphs, such results as bear comparison with those secured only by government action elsewhere. The telegraphic system of France, Belgium and Switzerland is considered the best in continental Europe, and especially worthy of imitation. Let us see, therefore, what the resources of the government have done for the people of those countries. The following comparative statement will assist in the examination:—

	Miles of wire.	Offices.	Proportion of offices to inhabitants.
France,	71,030	1,301	1 to 30,753
Belgium,	5,395	307	1 to 10,000
Switzerland,	3,717	252	1 to 10,000

Now let us compare the above with those countries which are free from government control:—

	Miles of wire.	Offices.	Proportion of offices to inhabitants.
England,	77,440	2,040	1 to 14,000
New Dom.	9,040	497	1 to 8,000
United States	150,000	4,000	1 to 7,500

In all other countries of Europe the comparison is far less favorable for government control than in these enumerated. Russia has but 40,000 miles,

Austria, 25,000, Italy, 20,000. The telegraphic system of the United States is more than twice as extensive as that of France, five times greater than that of Russia, and equals in extent the aggregated systems of Austria, Prussia, and the lesser German states, Italy, Spain, Belgium, Switzerland, Greece, Turkey, and all this has been accomplished by the energy and activity of private enterprise.

It is stated that there are eighty-eight places in England and Wales of more than 2,000 inhabitants with no telegraph communication, but we know of no place in the United States with that number of inhabitants without an office, and a great majority of the towns with four or five hundred inhabitants are provided for. Besides, efforts are constantly put forth to increase the offices and the facilities for doing business. The Western Union Telegraph Company expended in seventeen months, ending January 1st, 1868, \$828,463, in the construction of new lines, and during that time has opened several hundred new offices. In order to retain its position and forestall competition this company is compelled to provide for the wants of the country wherever there is a reasonable prospect of remuneration for the service.

The following statements of the number of offices in the principal cities in the northern section of the country, will give an idea of the extent of the present facilities in those places. New York has 74 offices, Philadelphia 35, Boston 24, Chicago 22, Cincinnati 21, Baltimore 19, Washington 16. The number of employees attached to the telegraph offices in New York is 375, in Philadelphia 211, Baltimore 114, Boston 156, Washington 115, Cincinnati 93, and Chicago 86.

Private enterprise has with us so far achieved much greater results than governmental management in Europe. As regards the tariff for messages, they are less than the rates established in Europe, if we take the depreciation of our currency into account. Reductions in rates to more than one thousand offices have been made within the past year, amounting, in some cases, to as much as 50 per cent., and the Western Union Telegraph Company—whose lines extend from the Gulf of St. Lawrence to the Gulf of Mexico, and from the Atlantic to the Pacific Ocean—is constantly engaged in the reduction of its rates, irrespective of competition or any other extraneous influence.

G. B. P.

### Double Transmission.

We have had in our possession for some months sketches of the European double transmitting system prepared by one of our ingenious city operators, but have been prevented publishing them on account of the pressure of other matter. In response to a wish expressed by some we will soon give diagrams of all of these as opportunity offers. Except to Companies who have to economize their wires, the process is not a desirable one for practical use. We want to remove dangers, not to invite them; still the process of double transmission over a single wire is interesting and attractive and deserves illustration.

We are glad to see that Dr. Bradley our veteran instrument maker, has taken to himself a partner in life, in the person of Mrs. Jane A. Reed, of Jersey City. We have seen no cards, and received no cake to put beneath our dreamful pillow, but we wish the Dr. and his companion many years of happy domesticity and every blessing which can make life cheerful and desirable.

A copy of an address by 400 operators and clerks to the executive officers of Telegraph Companies respecting Sabbath labor has been handed to us by a friend, but to which we must postpone reference until a future number. The address issues from Boston.

### Bishop's Central Telegraph Depot.

113 Liberty Street, New York.

Mr. Bishop's circular giving notice of his design to open an exhibitor's room for telegraph wares, we received just as we were going to press with our last number. The efficiency of such a place depends much on its acceptability with manufacturers and their confidence in Mr. Bishop's fairness. A Central Depot, central and accessible, and in control of one so well and favorably known as Mr. Bishop, can become a great convenience, and, to manufacturers, a great economy. The room will no doubt be opened and become a place of resort for purchasers. We hope it will prove acceptable to manufacturers, and give to the public the opportunity of seeing the progress of invention and the skill of our various telegraphic workmen.

### Death and a Fortune—A Sweeping Patent. Obituary.

Professor Charles G. Page, of the United States Patent Office, died on the fifth inst., after a lingering illness. He was the author of many important discoveries in electro-magnetism, and the inventor of an electro-magnetic motive power engine, which attracted some attention from fifteen to twenty years ago. Prof. Page had for many years been chief examiner in the Patent Office, of the class termed "philosophical instruments," embracing all inventions in mathematics, mensuration and electricity, and including clocks and watches, optical instruments, meters of all kinds, telegraphs, and a great variety of other subjects, and he had served in the examinational capacity for a longer period than any examiner now in the Patent Office. His duties have always been performed with ability and to the general satisfaction of those doing business with the Office, and his place cannot be easily supplied.—*American Artizan.*

Before Mr. Page's decease a bill was passed by Congress granting him a patent for electric circuit breakers by which American telegraphy is practically put into the hands of his heirs. The items of the patent will be found elsewhere, and they cover every form of known telegraphy except the simple closing of a circuit by the key and hand. All automatic closers, repeaters, local circuits, registers, printing machines, &c., are covered by this sweeping patent. Prof. Page's connection with the Patent Office prevented the issue of this to him while engaged as an examiner. Now it is the property of his heirs. Circuit breakers in actual use or manufactured April 15th are exempt from its operation, but no machinery after that date can be employed without consent of the patentees. This will make some stir in telegraphic circles, especially as it is known that the heirs are determined to have the full benefit of the rights thus acquired.

### Returned to the Service.

We are glad to welcome back to new and less exhausting duties the late auditor, Edward Chapman, Esq. Mr. Chapman is well advanced in years, but maintains much freshness of life and manners, and a chirography of rare beauty. All his friends are glad to see him at his post again where we hope he will continue until the Friend of all toilers leads him to his rest.

Mr. Brooks has been adding to his stock of insulators by the manufacture of several new styles in which iron is not employed except for the stem. Some of the styles shown us are similar to those used with advantage in England, and consist of porcelain into which paraffine has been inspissated and having a rubber covered stem. One of these is very simple and easily substituted for some less perfect forms.

**BISHOP'S TELEGRAPH ROOMS,**

113 LIBERTY STREET, NEW YORK.

TO MANUFACTURERS OF TELEGRAPH AND ELECTRIC INSTRUMENTS AND APPARATUS:

I design opening Rooms in the building now occupied by the BISHOP GUTTA-PERCHA COMPANY, No. 113 Liberty street, N. Y. City, for the Reception and Exhibition of every kind of

**TELEGRAPH AND ELECTRIC APPARATUS,**

to be kept open Every Day, and properly attended to, and the articles on exhibition taken care of by me.

I invite you to send me any articles of your manufacture, properly labeled, with name and price at which you sell them.

The charge for space and care of Instruments, etc., will be ten per cent. of their marked saleable price for the year.

Insurance, if required, will be charged extra.

Exhibitors will at all times be admitted to the Rooms with their customers to show samples, and sell from them, free of charge.

N. B.—Battery power will be supplied for testing, etc.

Respectfully,

SAMUEL C. BISHOP.

New York, May 1st, 1868.

**MARGARET: A Story of Home Prairie Life.** By LYNDON. N. Y. Charles Scribner & Co. 1868.

This tasteful duodecimo, just issued by a firm well known for the delicacy of its taste in publications bearing its imprint, we find on our table. Having read many of its chapters before while being published as a serial, Margaret is no stranger to us. We are equally happy in an acquaintance with the fair authoress who disguises herself under the euphonious name of Lyndon. The one is a counterpart of the other, refined, intellectual, placid, pure. Nor do these characteristics which invest womanhood with her truest dignity and attractiveness, and which by that subtlety of the highest art which so pervades all it touches as to give the consciousness of beauty without the appeal of any special limning, prevent a power of delineation, a certain gentle graphness of illustration, a ripple of cheerful sunny lustre from distinguishing this welcome book which must make Margaret an honored guest wherever there is a true appreciation of the good and the beautiful. No one can read this story of a prairie home without being made better by the reading, even though the process be an unconscious one, just as the young green grass and the violets that silently look up to us on this sweet May morning, inspire us quietly yet effectively with a gentleness like their own.

We have not space to comment on this volume as we would gladly do. We introduce it to our readers with our warmest benediction. It will quicken the love of the true and the womanly, and prove a grateful addition to those purifying influences which God gives to a true woman wherewith to entone others with her own purity and gentleness.

**Removed.**

Messrs. L. G. Tillitson & Co., have removed to new and eligible quarters at No. 11 Dey street—first floor. This change indicates prosperity. No house deserves it more. Mr. Tillitson is a practical electrician, experienced, good-natured, polite. His firm has become what it is by promptness, fair prices, and good workmanship. We wish the house abundant success.

So much matter has accumulated upon our hands both from home sources and abroad, that until the last moment, we had determined on issuing a full double sheet. Finding however that great delay would thus be caused, we have, somewhat hastily, thrown together the usual quantity of matter, and may issue an extra number having special reference to the English Governmental assumption of the Telegraphs and its bearing on a similar purpose in America. The English papers have generally canvassed this new movement, and the data thus provided cannot but be useful to all concerned.

**TARIFF BUREAU.****Semi-Monthly Circular.**

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York, May 15, 1868.

To all Offices on W. U. Lines—

Please note the following changes, which have occurred since May 1st, the date of the last Tariff Order, in your Tariff Book:

**NEW OFFICES.**

Andover, Mass., tariff same as North Andover, Mass.  
Nicholasville, Ky., tariff same as Lexington, Ky., except from such points as Gen'l. Supt. Van Horne shall instruct to charge a special rate which he has been authorized to make.  
Sharon Springs, N. Y., reopened for the season.  
Seilwaukee, Mich., tariff same as East Saginaw, Mich.  
Girard, O., tariff same as Niles, O.  
Phalanx, O., tariff same as Leavittsburgh, O.  
Summit, Miss., tariff from Louisville, Ky., 1 60, from Washington, D. C., 3 25.

**OFFICES OPENED ON OTHER LINES.**

Cumberland Mills, Me., tariff 25 and 2 from Portland, Me., check Portland.  
Molino, Fla., 100 and 10 from Pollard, Ala., check Pollard.  
Philadelphia, N. Y., tariff 35 and 2 from Oswego, N. Y., check Oswego.  
Highland Park, Ill., 45 and 4, from Chicago, check Chicago.

**OFFICES CLOSED.**

Schooley's Mountains, N. J., mail business hereafter at Hackensack, N. J.  
New Canaan, Conn., mail business hereafter at Stamford, Conn.  
Ashford, Conn., Alkali, Neb., St. Veynna, Col.  
Malad City, Idaho, Shaffer, Pa.  
Offices having "Special Sheet A" will check North. Madison, O., tariff same as Painesville, O.; Conneaut, O., same as Ashtabula, O.; Amsterdam, N. Y., same as Schenectady, N. Y., with the following exceptions:  
Albany, N. Y. to Amsterdam, N. Y., 25 and 2.  
Troy, N. Y., to Amsterdam, N. Y., 25 and 2.  
Schenectady, N. Y., to Amsterdam, N. Y., 30 and 2.  
North East, Pa., same as Erie, Pa. To take effect May 20th, 1868, unless orders have been received otherwise.

WILLIAM ORTON,  
President.

**A New Cable.****GUARANTEED FOR ONE HUNDRED YEARS!**

The following letter has been placed in our hands. It bears the address of the "National Telegraph Co." ("Societe Americaine"). If the managers of such a company exist, they have the benefit of the translation:—

PARIS, le 18 Mars, 1868.

MESSIEURS—Une experience de plusieurs annees a suffisement demontree a tout le monde je pense, que tous les cables pour la telegraphie electrique construits jusqu'a ce jour sont vicieux, que tous se sont rompus et que tous doivent se rompre, parceque leur confection ne repond pas au service qu'ils doivent rendre.

J'ai donc l'honneur de vous faire connaitre, Messieurs, que j'en ai inventee un que ne se rompera jamais, et que j'ose garantir pour cent ans; mon cable outre sa solidite a toutes epreuves reunit une autre qualite qui nest pas moins a dedaigner: c'est qu'il est excessivement bon marche; ainsi, construit ici, je m'engagerais a le faire, pour la modique somme de frs: 1.70cs le kilo bien entensee pour le fer seulement.

En consequence, Messieurs, je viens vous offre, soit la confection de ce cable, soit la vente de mon invention, je vous cederai celle ci pour la modeste somme de deux cent milles francs, c'est peu de chose en egard des services exceptionnels, qu'il rendra a votre societe.

Si cette affaire, Messieurs, peut vous convenir, veuillez etre assez aimables de m'en dire un mot le plutot possible, parceque mon intention est a l'offrir a d'autres societes, si elle ne vous agree pas; je suis persuade qu'elle presente trop d'avantages pour ne pas etre accueilee de suite.

Je me tiens, Messieurs, a votre disposition je me rendrai a New York a votre premier appel; toute-

fois, bien entensee a vos frais et moyennant de mon garantir une indemnite de cinq mille francs, dont 1,500 francs comptant, et 3,500 francs a mon arrivee, pour ne couvrir de frais, de deplacement et perte de temps.

Agreez, Messieurs, mes bien sincerres salutations,  
DESMETZ.

Rue St. Denis, St. Antoine No. 1.

PARIS, March 18, 1868.

GENTLEMEN—Many years experience has, I think, afforded to the world sufficient proof that all the cables for telegraphic purposes hitherto constructed are faulty, that they break, and that they will continue to break because their construction does not harmonize with the amount of service they are intended to perform.

I have, then, the honor, gentlemen, to inform you that I have invented one which will never break, and which I venture to guarantee for a hundred years. My cable, independently of its solidity in all respects, possesses another quality by no means to be despised, namely, its excessively low cost. I would engage to manufacture it here for the small sum of one franc seventy centimes the kilogramme, it being understood that this charge is for the iron only.

Further, gentlemen, I offer to give up to you the construction of this cable, to sell you my invention for the modest sum of two hundred thousand francs, a small consideration compared with the inestimable services which it will render to your company.

If this matter, gentlemen, should be deemed worthy your consideration, will you kindly inform me of it at your earliest convenience, as should it not, it is my intention to offer it to other companies, persuaded as I am that the advantages it presents are too numerous to allow it to be long neglected.

I hold myself, gentlemen at your disposal, and will present myself in New York at your first call, always, be it understood, at your own cost, and deducting from my guarantee an indemnity of five thousand francs, 1,500 of which to be paid here and 3,500 on my arrival, to cover my expenses for freight, passage, and loss of time.

I am, Gentlemen,  
&c., &c., &c.,  
DESMETZ.

Rue St. Denis, St. Antoine No. 1.

We have thus introduced Mons. Desmetz to the nation, and hope 1500 francs will be at once sent to him with such delicacies as a gentleman from Paris may be supposed to require. Should Mons. Desmetz deem it convenient to make a permanent home at Pere la Chaise before the expiration of the guarantee, we trust he will leave his hat as a security for any misfortune which may succeed his departure.

76,993.—PRINTING TELEGRAPH.—Edward A. Calahan, Brooklyn, N. Y.

I claim, 1st, A magnet for giving or controlling the impression, placed in a main electrical circuit, that is separated from the circuit that controls the type wheel or denoting device, so that the impression can be made independent of any other operation, when the type wheel or denoting device has been properly moved, substantially as set forth.

2d, Two or more type wheels, separately controlled by magnetism, and arranged side by side, or with their axes on the same line, so as to be impressed jointly or separately, on the strip of paper, substantially as and for the purposes set forth.

3d, The combination of the type wheels, k and l, magnets, f and i, with the magnet, c, and impression roller, u, or its equivalent, substantially as and for the purposes set forth.

4th, The reverse ratchet wheel, q, and pawl arm, in combination with the ratchet wheel, p, and pawl, 2, for moving and holding the type or character wheel, substantially as set forth.

We published in No. 4 an article from a European Scientific Journal, showing that a stream of electricity passed through a seed, caused a reversal of the natural growth, the stalk growing downwards, the root upwards. Has the following any origin in electricity? Was Edgar Burnham ever in a Telegraph office?

#### A Most Strange Chapter.

*From the La Crosse Democrat.*

A correspondent writes us from Waterloo, Iowa, asking if we know of one Edgar Burnham, and of his history.

We do. And as it is a strange, true one, known to hundreds, we give it in the *Democrat* as it is, and we may correct some errors those who speak of him have failed to do. Eight years since, when we were engaged as city editor of a Milwaukee paper, there lived in this State an editor named Powell, now connected with a Chicago paper, we think. He is, unless he has quit it lately.

In 1862 Powell was married to a Miss Ellen Burnham, of Brodhead, Wis., after a courtship of some months. Miss Burnham's parents were old residents of Brodhead, and of high respectability. The daughter taught music, had a large number of pupils, and was very attractive. Powell lived with her as a husband two years, she being all that time a good wife in all respects, presenting him with but one child. At the expiration of two years, when about 21 years of age, Mrs. Powell's voice changed, she grew light whiskers, and gradually changed her sex, *developing into a man* in all respects, as if nature, anxious for a freak, had turned a portion of herself wrong side out.

The husband and wife separated when the wife became a man, and Mrs. Ellen Powell took the name of Edgar Burnham, donned male attire, sought and obtained employment as a clerk in Chicago, and lived a single young man for one year.

During this time he fell in love with a niece of Senator Morgan, of New York, but did not marry her, for reasons not pertinent to this article. But about the end of the year he did marry a young lady of Brodhead, Wisconsin, a Miss Gerta Everett, who was a music pupil of his when he was a Miss Ellen Burnham, over three years previous to the marriage. This second marriage was about two years ago. Soon after this marriage "Edgar" Burnham and wife removed to Waterloo, Iowa, where they now reside, or did not long since.

The former girl is now a man, the former wife is now a husband, the former mother is now a father, the former young lady teacher of a young lady is now that young lady's husband! Truth is, indeed, stranger than fiction, and the above simple statement of facts borders so upon the marvellous we could not believe it did we not personally know nearly all the parties.

Any one can be convinced, by writing to the parties in either of the places we have named, of the *full and entire truth of this wonderful transformation*, which puzzles not only the medical but the entire scientific world, and which fact appears now for the first time in print, though the particulars have long been known to us and to many other newspaper men and prominent citizens of this State.

#### Patents.

ELECTRO-MAGNETIC LOG.—W. I. Reid, Brooklyn, N. Y.

I claim the log, provided with a break for closing and breaking the electric circuit, substantially as described, in combination with the registering-instrument connected therewith by an electric conductor, the said registering-instrument being provided with an escapement operated by an electromagnet, and with the means described, or equivalent means, for registering, all substantially as specified and for the purpose set forth.

ELECTRIC TELEGRAPH.—Cromwell Fleetwood Varley, New York, N. Y.

I claim, 1. Making insulators for telegraph wires of two or more insulating caps, exclusive of the cement which unites them, each cap being a complete insulator in itself, so that if one of the caps be defective, the other or others shall arrest the electric current, as set forth.

2. The use of a non-conducting pin inside an insulating cap, such pin being constructed of iron or steel covered with hard rubber, or being formed of stoneware or porcelain, substantially as described.

3. Glazing the lower part of porcelain or stoneware or earthenware caps, and leaving the upper part unglazed, substantially as and for the purposes set forth.

4. Making the lower edge of the insulator cap externally sharp, but internally rounded, so that drops of rain, when blown outwards, shall fall off, and when blown inward shall not break off, but run, by capillary attraction, up the rounded surface out of the wind, substantially as set forth.

5. Making porcelain or stoneware or earthenware caps with two or more projecting ears, in combination with and arranged above and below the groove for the wire, so that when the insulator is inclined to the wire, the latter can be inserted, but when at right angles to it, the latter cannot be gotten out, as set forth.

#### The History of a New York Bank Cashier.

"Burleigh" writes from this city to the Boston Journal:

"The cashier of one of our leading banks resigned some time since, and the paying teller was immediately elected to fill his place. He was quite a young man, and was promoted over the heads of those who had been in the bank many years in subordinate positions. The secret of the promotion is well worth knowing. The new cashier lives some miles out of the city. He entered the bank when quite young. He resolved to make himself useful. Living farthest away, he was the first at his post in the morning. Having the farthest to go, he was the last to leave. He never was afraid to work, and never hesitated to lend a hand when his own duties were done. Others would go out to restaurants and hotels for their lunch. He brought his with him, and ate it in a little closet. For his own pleasure he never left the bank during business hours. If any of the clerks wanted to go away, he was always ready to take their place. He could always be found, and was prompt at any call. His spare time was devoted to an intelligent comprehension of his business. As paying teller he was very popular. He was never snappish or ungentlemanly. Growling, grumbling, unreasonable customers could not irritate him. He overstayd his time to accommodate men who were belated with their checks. As cashier, he is the same genial, agreeable, prompt officer that he was in subordinate life. Men disappointed in their discounts take a refusal from the cashier with a better spirit than they do an accommodation from some men. He still keeps up his habits of close attention to business, and takes his frugal lunch in his closet as when struggling for position."

#### The Atlantic Telegraph a Nuisance.

The *Poll Mall Gazette* says:—"The existence of the Atlantic telegraph certainly lessens the interest of the impeachment trial. The bald statements sent through the cable keep the English reader constantly in advance of any real information, and when he has read in one column of the newspaper that the case for the prosecution has closed, it is difficult to fix his attention upon those preliminary details which appear in another column. Except to persons interested in the rate of exchange, the Atlantic telegraph, has hitherto been simply a nuisance."

#### A Locomotive Struck by Lightning.

*From the Peoria Transcript, 4th inst.*

On Friday last, during the hail storm that visited this section, the eastward bound train on the Toledo, Peoria and Warsaw railway, George Boies, conductor, and C. A. Martin, engineer, had just left El Paso as the storm struck it. When about a mile and a half east of that city the lightning struck a telegraph pole. Instead of shattering it and going to the ground, it burst the insulator, making a blaze of light, passed on the wire to the next insulator and burst that, with another blaze of light, as intense, a looker on informs us, as a thousand gas jets, and so on for five poles. It then ran down one pole and leaped to the track, and ran back without doing any damage until it struck the engine. It ran up one of the drivers and burst a section of two feet out of the solid tire, and passing along the boiler, without doing any damage, it reached the lever and went upwards with a blaze of light similar to that on the telegraph wire, and with a detonation like a small cannon. So intense was the light, and so violent was the shock that the engineer was nearly blinded, and almost stunned. Our informant says that the appearance of the light on the track and on the wires was brilliant beyond conception. It looked as if there was an immense lake of fire ahead, into which the train was about to plunge, and the contrast between the light and the ordinary day light that followed, seemed as great as that between the brightest day and the darkest night.

#### Perseverance.

The little city of Freyburg, in Switzerland, has the largest organ in the world. When in full play, it pours forth a tempest of sounds through a forest of pipes, "seven thousand, eight hundred in number," shaking the walls and the foundations of the old St. Nicholas Church in which it stands. All the musical bands in Boston, New York, and Philadelphia combined would not make an orchestra equal in power to this mighty instrument alone.

It is all the work of one man, named Aloys Moser. He was poor; he was not thought to be a master in his art; he never received any adequate reward for his labor. Without assistance or suggestion from others, he formed the design of building, for his native city, an organ which travellers from distant nations should turn aside from their journeys to hear; and which, when heard in the darkness of the cathedral at night, should make an hour for them never to be forgotten. And so poor Moser began his life's work, and he persevered for long years in the face of opposition and poverty and ridicule, until his task and his life were finished together. His aim may not have been the highest, nor his motive the best, but he persevered with the faith of a martyr till his work was done; and now it stands among all similar works in the world, like Mont Blanc among the mountains, peerless and alone.

#### Wires Leading into Offices.

*From Varley's Report.*

The "leading in wires" are fruitful sources of interruption everywhere. In England we formerly used with great success wires covered well with gutta percha, and then wrapped with tape and then saturated with the following mixture nearly cold:

Boil together equal parts in bulk of wood tar, gas tar and slacked lime. Stir well when boiling and continue the heat until the moisture is driven out, which is seen by the frothing subsiding. When cool apply to the taped wire, and then cover the wire with dry sand.

Hang the wire up to dry in the air, and in three or four days time it will be ready for use. This resists sun and moisture and protects the gutta percha.

During the last few years we have used Hooper's wire, which is cheaper and better, and in some cases we have used the semi-hard vulcanite covered wire.

**Telegraphers'****Mutual Life Insurance Association.**

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postage, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to have in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

J. D. REID, Treasurer.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

**DIRECTIONS TO APPLICANTS.**

I. The number admissible as members of the Association at any one time, having been limited for the present to fifteen, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be returned by mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a responsible Manager will be regarded as denoting eligibility as usual, and the signature of the applicant, with date, amount of recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed.  
His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them.

Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

## PRICES.

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	18 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	18 00
Main Sounders same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	4 50 to 6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package.

He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers prices.

VOL. I.

## The Government and the Telegraphs.

From the London Times.

The Parliamentary Return named below furnishes the public with the facts and arguments on which the Government have relied in introducing the Bill before the House of Commons for the acquisition of the electric telegraphs by the post-office. It consists of two reports by Mr. Scudamore to the present and the late Postmaster-General. The pamphlet of which the title is also given below is an argument against the Government Bill, on behalf of the Electric and International Telegraph Company. It ought to be able, therefore, in these two representations to obtain a sufficient view of the reasons for and against this important proposal. To a great extent this advantage is obtained; but we must confess there are points of consequence on which conflicting statements leave us in considerable doubt. We cannot but think it unfortunate that the scheme of the Government, and the grounds on which it has been proposed, should have been so tardily announced. Mr. Scudamore's reports, standing by themselves, could appear conclusive, but after reading the statement of the Company the case does not appear to us plain. The pamphlet is written with most unnecessary heat, but it nevertheless shakes Mr. Scudamore's arguments in some instances, and adduces considerations which he seems to have overlooked.

The Company are mistaken in supposing that the scheme is a novel one. It seems to have been first suggested by Mr. Thomas Allan in 1854. Two years afterwards an officer of the post-office submitted a similar plan to the Lords of the Treasury. In 1861 a more important memorandum to the same effect was addressed to the Chancellor of the Exchequer, and by him forwarded to Sir A. Spearman and Mr. Scudamore for consideration. It was written by Mr. Ricardo, formerly member for Stoke, and Mr. Burrell, of the Broad Sanctuary. Mr. Ricardo was the founder of the Electric and International Company. The subject was revived by the Edinburgh Chamber of Commerce in 1865, and in consequence Lord Stanley of Alderley, who was then Postmaster-General, directed Mr. Scudamore to inquire into it. The result was the first report in this Return. The change of Government delayed the question; but, under the direction of the Duke of Montrose, Mr. Scudamore was again directed to the subject, and presented a supplementary report last February.

The experimental data upon which the scheme is founded are derived chiefly from the Belgian and Swiss systems; and Mr. Scudamore commences both his reports by an examination of these systems. Unfortunately, his representations on this fundamental point are directly challenged by the Company, and it is not easy to decide between the two. We will, perhaps, be best to quote the following summary by Mr. Scudamore himself of the results of his comparison:—

"I. From the following table it will be seen that at the close of the year 1865, the proportion of telegraphic accommodation to territory and population was greater in Belgium and Switzerland than in the United Kingdom;—

There was at the close of 1865,	In Belgium.	In Switzerland.	In the United Kingdom.
Miles of Telegraphic line to every 100 square miles of territory . . .	17½	13 7-10	11 2-10
Number of telegraphic offices to every 100,000 persons . . .	61.8	99.10	56.10

"II. In the next place, while the facilities for telegraphic communication were less extended, the tariff for inland messages was higher in the United Kingdom than in Belgium and Switzerland. In Switzerland the charge for a message of 20 words had for many years been, uniformly and without regard to distance, one franc. In Belgium the charge for a like message was also uniformly one franc from December, 1862, until December, 1865, when it was reduced to half a franc; while in the United Kingdom the charge ranged upwards from 1s. according to distance, the attempt which the United Telegraph Company made to establish a uniform rate of 1s. having been defeated by the too powerful competition of their rivals, and the tariff of the London District Telegraph Company—viz., 6d.—being limited to a very narrow area. Since the close of 1865 the London District Telegraph Company also have substituted a tariff of 1s. for a tariff of 6d., while the other companies have adhered to a tariff varying with distance, but the Belgian and Swiss Governments have maintained respectively their tariffs of half a franc and one franc to the end of 1867, when the Swiss inland rate also was reduced to half a franc.

"III. My report next pointed out that under the combined influence of greater facilities and a lower tariff the development of telegraphic correspondence had been proportionately greater in Belgium and Switzerland than in the United Kingdom. In arriving at this conclusion I argued that the utility of a telegraphic message might be measured by the time gained by the telegraph over the post, and that the success of a telegraphic system might consequently be ascertained by a comparison of the growth of its business with the growth of the business of the post-office in the same place or country. As by reason of the greater extent of the United Kingdom the telegraph has a much greater advantage over the post in the United Kingdom than in Belgium or Switzerland, while there is no material difference in the rates of postage prevailing in the three countries, it seemed reasonable to expect that, even without taking into account the superior wealth and greater commercial activity of the United Kingdom, inland telegraphic messages would bear a higher proportion to inland letters in it than in Belgium or Switzerland. The following table shows, however, that the proportion of inland telegrams to inland letters has all along been much lower instead of much higher in the United Kingdom than in Belgium or Switzerland;

### PROPORTION OF INLAND TELEGRAMS TO INLAND LETTERS.

Year.	Belgium.	Switzerland.	United Kingdom.
	Telegrams. Let'trs.	Telegrams. Let'trs.	Telegrams. Let'trs.
1860	1 to 218	1 to 84	1 to 296
1861	1 to 195	1 to 87	1 to 273
1862	1 to 187	1 to 80	1 to 221
1863	1 to 114	1 to 74	1 to 197
1864	1 to 83	1 to 70	1 to 169
1865	1 to 73	1 to 69	1 to 151
1866	1 to 37	1 to 69	1 to 121

"In other words, in Belgium in the year 1866 there were 5-7ths of an inland telegram to every five persons, and in the same year there should have been in the United Kingdom, if its correspondence by telegraph had been proportionate to its correspondence by post, 3 4-7 inland telegrams to every five persons. There was, however, but one telegram of all kinds to every five persons.

It is a curious instance of the ambiguity of statistics that, by another form of calculation, the Company are able to present results materially at variance with this conclusion. If we compare the telegrams, not with the number of letters, but with the area of the countries, it appears that in the United Kingdom the number of messages to the square mile is 51, whereas in Belgium it is 61. In Switzerland, however, the messages to the square mile

are 44. Considering that the area of the United Kingdom is 122,000 square miles, whereas Belgium contains only 11,000 square miles, and Switzerland only 15,000, this comparison will appear by no means unsatisfactory. Again, the number of messages sent in the United Kingdom amount to one-fifth of the total number of inhabitants, whereas in Belgium they are only one-seventh, and in Switzerland one-fourth. The Company, indeed, justly observe that before the comparison between telegrams and letters can be depended on, we must know that the "letters" in question are of a similar character. A system has grown up in this country of distributing, by means of the post, millions upon millions of tradesmen's circulars, patterns, samples, appeals for charities, and the like. In Belgium and Switzerland this system is comparatively unknown. It is, therefore, entirely fallacious to base any calculations on the proportions of "letters" passing through the posts of the respective countries, unless you can eliminate from the English post all the circulars, samples and patterns that are circulated through it. If this could be done, it is probable that the telegrams in England would be found to bear a much larger proportion to the number of letters than either in Belgium or Switzerland.

It is, then, doubtful as a matter of fact whether, "under the combined influence of greater facilities and a lower tariff, the development of telegraphic correspondence has been proportionately greater in Belgium and Switzerland than in the United Kingdom." It may further be doubted whether the elements of comparison Mr. Scudamore has chosen are sufficient to show that our facilities are so far inferior. He compares the miles of telegraphic line with the square miles of territory. But the area of England being about ten times that of Belgium, there must of necessity be, so to say, greater waste spaces. The more scattered the population the smaller must be the proportion of miles of wire required. Mr. Scudamore admits, in fact, that there is "a more liberal allotment of wires to lines in the United Kingdom than in Belgium and Switzerland; but this," he adds, "does not compensate us for our more restricted distribution of the lines and less copious dissemination of telegraphic offices." If we attempt to reconcile these counter-representations, it would seem that whereas the system is more extended in Belgium and Switzerland, it is more active in this country, so far as it extends. It will be worth while to quote the following interesting sketch by Mr. Scudamore of the means for telegraphic intercourse at the disposal of the Belgians. Mr. Scudamore says:

"In addition to the 307 offices which are provided with the apparatus for the transmission of telegrams, there are certain offices not so provided, but at which the public may deposit and pay for their messages. These offices are called offices of deposit. Every post-office which is not a telegraphic office is an office of deposit, and like offices have been opened at a large number of railway stations. Ordinary messages, which are said to form 93 per cent. of the whole number of messages, are those which do not involve any complicated operations, such as repetition to insure accuracy, payment for reply, the following the addressee from place to place, the delivery of copies to more than one address, and so forth. Ordinary telegrams, moreover, must be paid for in stamps, or, which comes to the same thing,

must be written on stamped paper. For 5d., then, an ordinary message of 20 words may be sent from any part to any other part of Belgium. The sender may either take or send it to the nearest telegraphic office, or, if that be too distant from him, may deposit it at the nearest deposit-office, from which it will be despatched free of charge to the nearest telegraphic office; being despatched at once if the telegraphic office and the deposit-office are situated in the same locality, and, when they are not so situated, being despatched by the first outgoing cart or carrier. Even in these latter cases, should the sender desire immediate despatch from the deposit-office to the nearest telegraphic office, the deposit-office will find the means of despatch if the sender will defray the expense. On the arrival of the message at the terminal telegraphic office it is at once delivered free of charge, if the addressee resides within the limits of the terminal office: but if he does not so reside, it is sent to him free of charge by post. Even in these latter cases, however, the sender, by paying the expense of a special messenger, may have it so delivered. The locality served free of charge by a telegraphic office is defined as comprising the whole of the town or village in which the telegraphic office is situated, and the adjoining places within a circle of two kilometres—i. e., a mile and a quarter—from the telegraphic office. Lastly, it may be noted that, even if a double transmission by post takes place—i. e., a transmission by post from the sender to the telegraphic office of despatch, and a transmission by post from the telegraphic office of receipt to the addressee, no addition is made to the charge of half a franc.

"For the 'extraordinary' telegrams, the old tariff of 10d. for 20 words, with an addition of 5d. for every addition of 10 words or part of 10 words, has been retained. The sender of such a telegram has the right, on payment of a double charge—i. e., on payment of 20d. for 20 words—to require a record of its receipt. When he does this, the receiving-office transmits to him by telegraph an exact copy of his message, together with a note of the hour at which his message was delivered, and of the name of the person to whom it was delivered. The sender of an 'extraordinary' telegram may require it to be re-directed by telegraph in the event of the addressee having gone from the delivery of the receiving-office to the delivery of some other telegraphic office, and he may have copies thereof delivered to any number of persons residing within the delivery of the receiving office at a charge of 5d. per copy."

The Swiss system is much the same, but there is one important addition—namely, that in Switzerland *mandats de post* (money orders) may, if the sender desires it, be sent by telegraph instead of by post.

Now, these are facilities which we could never hope to obtain from any private company. The company assert that this apparent completeness is gained at the expense of expedition. Some of their statements with respect to the Belgian management are refuted by Mr. Scudamore. In other respects the two statements are quite irreconcilable. A letter-carrying company whose sole object was revenue would never open post-offices in every country village and provide a daily transmission of letters. The post-office is required to do it on the grounds of public policy, without reference to revenue, and is expected, therefore, to work a considerable part of its machinery at a loss. The Department might be charged with a similar duty in the telegraphic service of the country if an adequate public advantage could be anticipated. Let us, then, see exactly what it is that Mr. Scudamore proposes to offer us. His scheme is summed up in the following paragraphs:

"What, then, would the post-office be able to do for the public if it were intrusted with the management of the telegraphs? It would be able to bring the telegraphs closer to the population, to extend the hours during which they could be used daily, to reduce the charges for the transmission of messages, and, lastly, to give facilities for the transmission of money orders by telegraph."

"I do not propose to encumber this Report, which is already of inconvenient length, with a detailed statement of all the arrangements, which it would be in the power of the post-office to make if it were intrusted with the management of the telegraphs, but will content myself with submitting the following outlines of the plans which would probably be found best suited to the purpose."

"I would propose,—

"A. To open a central telegraphic office at each of the ten district post-offices in London."

"B. To open subordinate telegraphic offices at the sorting offices and receiving offices in each district."

"C. To connect the subordinate telegraphic offices of each district with the central telegraphic office of that district."

"D. To establish direct communication between each central telegraphic office and each other central telegraphic office in London."

"E. To establish central telegraphic offices at the post-offices of the principal towns in the kingdom, and to establish direct communication between all such central telegraphic offices and the central telegraphic office in the East Central district of London."

"F. To establish direct communication between the more important of the central telegraphic offices in the provinces, and the central telegraphic offices in the west central, western, and southwestern districts of London."

"G. To establish a direct communication between each central telegraphic office in the provinces and such of the other central telegraphic offices in the provinces as it might be desirable to connect with it."

"H. To open subordinate telegraphic offices at the district offices, sorting-offices, and certain of the receiving-offices in Liverpool, and to connect them with the central office in Liverpool, and in like manner to open subordinate telegraphic offices at the principal receiving-offices in such towns as Edinburgh, Dublin, Manchester, Glasgow, Leeds, Bristol, Sheffield, Bradford, and to connect each group of such subordinate offices with its central telegraphic office."

"I. To open subordinate offices, connected in like manner with central offices, at the money order offices of all places having a population of 2,000 persons and upwards."

"J. To open deposit offices—i. e., offices at which messages may be deposited and the charge thereon paid—at every post-office in the United Kingdom at which no telegraphic office is established."

"K. To permit the pillar-boxes throughout the kingdom to be places of deposit for messages, provided such messages be written on stamped paper."

"L. To require payment for messages to be made in stamps, or by writing them on stamped paper, and to issue special stamps for that purpose."

"M. To make the charge for transmission from any one part to any other part of the United Kingdom, uniformly and without regard to distance, 1s. for the first 20 words, with an addition of 6d. for every addition of ten words or part of ten words, such charge to include free delivery by special messenger at any place within the town delivery of the terminal office when that office is a head post-office, and within one mile of the terminal office when that office is not a head post-office, and to include free transmission by post from a deposit office to the nearest telegraphic office, when the message is so left for transmission, or free delivery by post when the addressee resides out of the limits of the terminal office, and the sender does not desire to pay for a special messenger."

"N. To fix the rate for conveyance by special messenger beyond the limits of the free delivery at 6d. per double mile."

"O. To make arrangements, on the plan of those prevailing in Belgium and Switzerland, for the registration or redirection of telegrams, and for the delivery of copies."

"P. To give facilities for the transmission of money orders by telegraph on payment of the charge for the message and of a commission, which shall not be less than two ordinary commissions, and under certain restrictions as to the amount to be remitted by any one person."

"Q. To effect a reduction, corresponding with the reduction of the charges for the transmission of inland telegrams, in the tariff of charges for the transmission of messages to foreign parts."

"R. To prepare a telegraphic guide, to be sold at a charge of not more than 6d."

"The period during which telegraphic offices are open daily for transmission of messages would also in many cases be considerably extended."

Perhaps it will render the effect of this scheme the plainer if we quote some illustrations which Mr. Scudamore gives of its practical working:

"I will first take the case of a person residing in a suburban district of London—for instance, Sydenham—receiving a letter from a correspondent in a suburban district of Liverpool by the first morning delivery, and desiring to send an immediate reply, in the hope of receiving a rejoinder from his correspondent by night mail. As matters at present stand, he can send a telegram through the London District and Electric and International Telegraph Companies; but to do this he must walk or send to the telegraph office, and the transmission and delivery of the message will in no case cost him less than 1s. 6d. for 20 words. The cost will increase with the distance of the addressee's residence from the receiving telegraphic office, and in all but extremely urgent cases the labor and the cost combined would deter him from using the telegraph. But if the scheme which I have described were in operation, and if he could confine his message to 20 words, write it on a stamped paper, and deposit it in the nearest pillar-box or deposit office before 12.45 P. M., he would secure its delivery, free of further charge beyond 1s., in any part of the postal district of Liverpool by 5 P. M., which delivery would leave his correspondent ample time for rejoinder by night mail."

"But let us suppose that the resident at Sydenham desires something more than a rejoinder by night mail—let us suppose that he desires his correspondent to leave Liverpool by a train starting from Liverpool at 5 P. M. In this case he might, if the scheme which I have indicated were in operation, take his message to the Sydenham sorting office by, say, 11 A. M., and secure its delivery (for one shilling) in any part of the postal

district of Liverpool by 3 P. M.; which delivery would give his correspondent time to catch the 5 P. M. train."

"Or let us take the case of a solicitor having his place of business in Chancery Lane or in Bedford Row, and being desirous to summon a number of witnesses from the suburban districts of Liverpool, and at the same time to send them money on account of the expenses of their journey. Such a solicitor, if the scheme which I have described were in operation, might not only, by depositing his message at the West Central Office by 11 A. M., have a copy sent to each witness by the 1 P. M. delivery in Liverpool, but might at the same time furnish each witness with a telegraphic money order, and the witnesses would have ample time to obtain cash for these telegraphic money orders before their departure from Liverpool on the same day."

In order to appreciate Mr. Scudamore's plan, it is necessary to add his observations on these instances:

"It will be obvious to all who study these illustrations that in an immense number of cases a service partly postal and partly telegraphic would meet all the requirements of the senders, while it would be much cheaper (the whole cost being covered by the charge for the telegram) than a service partly by special messenger and partly by telegraph. And it will be equally obvious that this partly postal and partly telegraphic service would in a vast number of cases serve as well for the reply to the message as for the message itself. For the transmission of a letter and the reply thereto between Lampeter and London forty-four hours are required: but for the transmission of a message and the reply thereto between the same places, on the partly postal and partly telegraphic system which I have described, only twenty hours would be required. So, again, the course of communication between Fort Augustus and London would, on the plan I have described, be shortened by a period of from two days to two days and a half."

That this combination of telegraphic and postal services would be a great boon to the country cannot be doubted, but it remains to inquire how far it is practicable. The first question to be discussed is, "whether such a system could be carried on without loss to the State?" Mr. Scudamore's calculations, which are indorsed by the Assistant-Controller and Auditor-General, are as follows: He first assumes that under his system the proportion of telegrams to letters would become the same as in Switzerland. This would give an annual distribution of 11,000,000 telegrams. The average price of these would probably be about 1s. 2d., and there would consequently be a gross revenue of about £640,000 a year. On the other side of the account, he estimates the value of the property of the companies at three millions, and, besides this, £100,000 would have to be expended in the extensions proposed. This would give a permanent annual charge of about £100,000. Subtracting this from the gross revenue, we have left for working expenses £540,000. Now, the expenses of the existing companies are £345,000 a year. The increased business might augment this sum; but, on the other hand, amalgamation would reduce it; and, on the whole, Mr. Scudamore thinks that the total expenses would not amount to more than £404,000. This would leave a surplus of £135,000. Making the utmost allowances for error, there could not, he thinks, be a surplus of less than £77,750.

It appears to us, we confess, that the Company indicate several weak points in this estimate. In the first place, if the objections offered above to the comparison between the number of telegrams and letters be just, the basis of the estimate is destroyed. In the next place, is the Government likely to maintain the telegraphs with the same economy as a company which is able to act as its own manufacturer and contractor? But there is one remarkable point which Mr. Scudamore wholly fails to meet. It must be understood that in Belgium the telegraphic business is of three kinds—"International," or messages received from or sent to foreign countries; "transit" messages, or messages which simply cross Belgium in transit from one country to another; and "inland" messages. Now, even while the tariff in Belgium was a franc per message, there was a dead loss of 2d. on each inland message and the chief profit was made on the transit messages. A similar result has been observed in Switzerland. It is obvious, however, that Belgium and Switzerland occupy a peculiarly favorable position for transit messages.

and that we could not depend on this additional source of revenue. But if so, it would appear by the examples of these two countries that the business must necessarily be carried on at a loss, and experience, therefore, would seem to contradict Mr. Scudamore's theory. Moreover, he seems to have based his calculation on inland messages alone, so that this objection is peculiarly forcible, and he has at least left us in the dark as to the probable expense and return of our "international messages." Of course, if the Government acquire the inland telegraphs from the companies, they will be obliged to acquire some of the "international" lines, and since, in our case, these would be all submarine cables, their expense would be much greater than that of the "international" lines in Belgium. On the whole, the calculation appears to us, at best, incomplete, and it will, we think, be difficult to obtain sufficiently accurate data.

But there are some general considerations adduced in the company's pamphlet which ought certainly to be carefully weighed against the advantages we have sketched. They give an account, for instance, of the series of experiments and improvements which they have systematically carried on, and it may be doubted whether the Government would have the energy or the interest to pioneer in telegraphic science to the same extent. A serious difficulty again arises in the relations between the railways and the telegraphers. At present, the Electric and International Company performs a great part of the telegraphic signalling required by the railways; and in consideration for such services the railway companies grant "way-leaves" to the telegraphic company. Is the Government prepared to undertake this business? If not, it would have, of course, to pay rental to the companies for the use of their offices and grounds, and a considerable sum would thus be added to Mr. Scudamore's estimate of "working expenses." The company next draw attention to a point of no little consequence to ourselves. They have an arrangement called a "Press tariff," under which they convey messages containing news of public interest to all the newspapers of the United Kingdom. "Columns upon columns of important news are thus daily and nightly transmitted to the newspapers at no more cost than the ordinary rate which those papers are accustomed to pay for the most common intelligence—namely, one penny per line. Does the Government propose to make itself the sole means of affording this intelligence?" Supposing they were ready to do so, is it altogether desirable that all the news agency of the country should be in the hands of the Government? But would it be possible for a Government Department to adjust itself to the sudden and exceptional demands sometimes made on the telegraphs in the discharge of this office? The following passage appears to us to suggest considerations of great importance and difficulty:—

"For many years the Electric and International Telegraph Company have had an 'Intelligence Department,' to which a large and experienced staff of editors, reporters, and others is attached, for the purpose of collecting home and foreign news, political, domestic, and commercial, and distributing the same to every point at which such information can afford interest. The clubs in London receive, every half hour, intelligence of the general proceedings of Parliament. The provincial newspapers and subscription-rooms, farmers' ordinaries, and other circles, are supplied by telegraph with news of every occurrence which can affect their interests. A visit to any one of these political or commercial centres will illustrate at once the vast importance, as well as the immense public convenience, of this organization. How does the Post-office propose to deal with arrangements such as these? What security would the public have, under Post-office arrangements, for the early, full, complete, and satisfactory conveyance of intelligence by telegraph? The 'Intelligence Department' of the Electric and International Telegraph Company has very varied duties to perform. Wherever there is any considerable gathering of individuals, whether for a permanent or temporary purpose, the wires of the Company have to be placed in their midst, and special arrangements have to be made for the conveyance of the intelligence arising from the gathering. If Her Majesty the Queen visits any particular part of her dominions, the report-

ers of the Company have to attend and to transmit information of every occurrence during the royal progress. If an agricultural meeting, a musical festival, or a Social Science Congress is held in any part of the United Kingdom, however distant, information of every day's proceedings has to be collected and conveyed. If a public man of mark addresses his constituents or a public meeting, in any portion of the country, the words which fall from his lips have to be reported and telegraphed to the principal newspapers of the kingdom almost as soon as they are uttered. Is it within the province, or the duty, or the business of the Post-office thus to undertake the work of the press? At the present time it is certain that all this information, so important to the public and to the world at large, will be transmitted with the greatest expedition, in the best and most comprehensive form, and at the lowest possible prices. But let the conveyance of such information become the duty of a Government department, and, above all, a monopoly in the hands of a Government department, and it may be considered certain not only that the supply of such information will be curtailed, but that the price at which it will be delivered will be largely and inconveniently enhanced."

It seems, indeed, true that "in seeking to possess themselves of the inland telegraphs, the promoters of this scheme do not appear at all to have foreseen the difficulties in which they were involving themselves—that they were interfering with all the *Railway Communication of the country*, with all the *Public Intelligence of the country*, with the *Press of the country*, and, above all, with our *Foreign intercourse*, political and commercial." These questions are scarcely, if at all, touched in Mr. Scudamore's reports.

There are several other points raised; but we have said enough to show that if there are great advantages offered to us by this scheme, there are not a few dangers in adopting it, and that there is room for a great deal of discussion before the public mind is fairly made up on the subject.

#### The Government and the Telegraphs.

From Engineering.

In the preamble of the bill introduced by the Chancellor of the Exchequer, it is recited that "Whereas it would be attended with great advantage to the State, as well as to merchants and traders, and to the public generally, if a cheaper, more widely-extended, and more expeditious system of telegraphy were established in the United Kingdom, and to that end it is expedient that Her Majesty's Postmaster-General be empowered to work telegraphs in connection with the administration of the Post-office."

It is, of course, a self-evident truth, that "a cheaper, more widely-extended, and more expeditious system of telegraphy" would be of immense advantage to the State, merchants, and the general community; but it will not be so easily conceded that all this is to be attained by simply transferring the administration of telegraphs from the present boards of direction of competing companies to a Government official.

Of course it would be quite possible for the Government to extend the lines, and even reduce the prices, since they have not to earn a dividend for shareholders; but that a *more expeditious system of telegraphy* shall at the same time be provided, without making the telegraphy a heavy yearly tax on the country, is simply promising great things, which we have not the slightest reason for believing can be brought about by merely placing all our telegraphic lines in the hands of an official of the Post-office.

A telegraph is not capable of conveying an unlimited number of messages per day, and therefore there is a limit as to the price at which messages could be sent remuneratively on any given circuit, even supposing that the wire was kept in constant work during the twenty-four hours. For such constant use, however, of one wire, throughout the twenty-four hours, we must suppose the messages arriving for transmission in continuous succession, or else *some must wait*. In practice, however, the great mass of messages are given in between business hours, say between ten A. M. and five or six

P. M. Sufficient wires must be provided, therefore, so that this mass shall be despatched within those hours, the wires remaining idle, or nearly so, during the rest of the twenty-four, or else messages must be delayed in order to spread them over the twenty-four hours. It is evident that the first method cannot be adopted at the same prices as the second, since it involves three times the number of wires required for the second. In fact, just as we reduce the price of messages, so we must either decrease the profit or increase the average delay. Assuming that the dividend earned by our present companies, therefore, is a fair one, it is evident that to decrease the price we must increase the average expedition with which messages are despatched, unless we can find some means of actually decreasing the time occupied in sending a message.

Mechanical manipulation, long ago proposed, experimented on, and rather carelessly abandoned, but now perfected by Wheatstone, in his automatic telegraph, is a great step in this direction, and, no doubt, when adopted throughout the principal circuits, will enable a reduction of price to be effected. But this improvement (the benefit of which we shall have whether the Government obtain their bill or not) is entirely a scientific one, and, indeed, as we have shown, the only hope of decreasing the price of telegraphing in England must be by means of scientific improvements such as these.

Now, have we any right to expect that the Government has some great stock of these improvements on hand, ready to be brought into play directly the lines are made over to them, or have we much reason to hope that such improvements hereafter will be more readily accepted by Government officials than by the officers and directors of our present telegraph companies? Does the history of the Admiralty or the War Office give reason to expect that inventors and scientific men will have a freer scope for improving telegraphs when these become a Government monopoly? We think not.

Government departments have not as a rule a character for quick perception of the advantages of any novelty, and we fear that, scientifically, the telegraph will come practically to a stand-still as soon as it passes into the hands of the Government. We shall, perhaps, be lucky indeed if we do not recede; for the grand promises of cheap telegraphs, and with greater expedition also, without any explanation of how this is to be effected, leads us to doubt whether the promoters of the scheme really have any plan in detail, or, indeed, any knowledge of the subject whatever.

We trust, at least, that a select committee will enable the whole design of the Government to be carefully weighed before the country takes the final step of placing our telegraphic system at the mercy of a Government department.—*Engineering*.

A new English invention is an apparatus for employing electricity, in connection with a thermometer, to regulate the temperature of a room. An ordinary mercurial thermometer is provided with a platinum wire inserted in the glass bulb, so as to be in connection with the mercury. Another wire, capable of elevation or depression, is placed at the other end of the thermometer. These two wires connect with two poles of a battery, and forming part of the circuit is an electro-magnet, whose armature control the opening or closing of a valve regulating the admission of hot air. If it is desirable that the temperature of the room should not rise above sixty degrees Fahrenheit, the point of the movable platinum wire is brought to that number on the thermometer. When the mercury registers sixty degrees, the circuit is closed, and the armature of the magnet closes the hot-air valve, until the temperature becomes reduced, when the valve is again opened. Thus a nearly even temperature may be maintained—a very desirable object in hot-houses.

**A Great Want Supplied.****BISHOP'S CENTRAL TELEGRAPH DEPOT—**

We commend Mr. Bishop and his very liberal enterprise to the 5,000 readers into whose hands this special edition of our paper will come. Both inventors and manufacturers can have complete confidence in his honor and liberality. We endorse him cordially.

**BISHOP'S TELEGRAPH ROOMS,**

113 LIBERTY STREET, NEW YORK.

TO MANUFACTURERS OF TELEGRAPH AND ELECTRIC INSTRUMENTS AND APPARATUS:

I design opening Rooms in the building now occupied by the BISHOP GUTTA-PERCHA COMPANY, No. 113 Liberty street, N. Y. City, for the Reception and Exhibition of every kind of

**TELEGRAPH AND ELECTRIC APPARATUS,**

to be kept open Every Day, and properly attended to, and the articles on exhibition taken care of by me.

I invite you to send me any articles of your manufacture, properly labeled, with name and price at which you sell them.

The charge for space and care of Instruments, etc., will be ten per cent. of their marked saleable price for the year.

Insurance, if required, will be charged extra.

Exhibitors will at all times be admitted to the Rooms with their customers to show samples, and sell from them, free of charge.

N. B.—Battery power will be supplied for testing, etc.

Respectfully,

SAMUEL C. BISHOP.

New York, May 1st, 1868.

**Journal of the Telegraph.**

This Journal will be issued on the 1st and 15th of each month commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

**TERMS:**

One Dollar per annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, MAY 22, 1868.

**EXTRA EDITION.****The Telegraph Control Bill.**

Justice to a subject which is of such national importance as the absorption of the telegraph system by the Government must apologize for our devoting this number of the JOURNAL so largely to its exposition. It is known that Mr. Washburne has been industriously collecting material from European sources to enable him to inaugurate a similar movement here. We begin to see what that material is. The report of Mr. Scudamore of the English Postal service to government, copious quotations from which will be found in the article from the *London Times* published on our first and following pages is the fruit of many years study, and must be regarded as exhaustive. For the past ten or more years, the subject has been under discussion by the English Postal Officers under different administrations, and the report just made, we must assume to be the conclusions of all the wisdom and ability which have been brought to bear upon the subject.

We regret that we have not yet obtained the complete documents in which the case is presented by government on the one side and the telegraph companies on the other, but we have in *The London Times* so ample extracts of the material portions of these antagonistic expositions, that they supply all the data which appears necessary.

The course of the English government in this investigation has been very peculiar. The companies

have been kept entirely in the dark as to its investigations, and have not been consulted in the preparation of its expositions. Neither have the English companies been invited to a joint consideration of a subject of so great importance to them, and on which they were supposedly, capable of shedding much needful light. The consequence is that the government presents its case copiously but weakly, and the Telegraph Company in the excitement of danger, warms up unnecessarily, dealing out in nervous Saxon its blows on every side, presents many facts which stagger its opponents, but nevertheless fails to close in so sharply with the adversary as to make the truth of its statements fully felt, and the contest is to some extent unsatisfactory.

One of the points made by government is that under a proper provision of telegraph facilities, the number of despatches should approximate the number of letters sent by mail. Of the supposed effect of this provision in Switzerland and Belgium some examples are given. We are unable to see, however, how any such comparisons can be used as a basis of argument except by introducing many other considerations which would properly enter into its examination. It was exactly on some such idea as this that in our own Senate Mr. Gratz Brown, of Missouri, made so many foolish and infelicitous statements. Telegrams were declared to be susceptible of delivery from Washington to New York for 3 cents, when it was within easy power of proof that it cost an average of 8 cents or more for delivery alone. The habits of a people, the nature of its commerce, the position of its centres of population and trade to each other, the postal facilities by railroads, the postal charges, and other influences all affect the solution of such a problem. The Telegraph Company very pertinently exposes the fallacy of the Government premises by reference to one single item, the facilities given by mail to scatter circulars throughout the kingdom, as in America for a merely nominal sum—the American postage being two-thirds of a cent each. Such facilities and the immense employment of them for advertising purposes, renders the comparison utterly preposterous. So that the statement narrows itself down to the simple truism that added facilities, will secure added business. Even this is true only to a limited extent, for where communities are uncommercial, and postal means at all good, no cheapness will induce the substitution of a despatch written briefly and by strange hands for the chirography which carries with it the charm of reality, and the little delicacies of language, without which, intercourse would be cold and undesirable. The telegraph will only be used when the tardiness of the mail interferes with a purpose, and even, if free, would never practically interfere with much which must ever seek the privacy of a personal seal and the protection of the mail bag.

The effect of a low tariff has been ignorantly exaggerated. It has been found that during a vigorous contest with an opposition line between two large cities, the reduction of the tariff to 10 cents per message, did not at all cause the use of the wires which many have so enthusiastically insisted must follow. To get at the merits of such a problem, one must consult the facts of his own case. "How many messages would I send per day, and on what subjects which I do not now employ the wires for, if messages were placed at a quarter of their present rate?" They would no doubt be multiplied, but it would at once be manifest that only in certain cases would the wires be used at all. Of course we throw out of view the question whether any company could sustain itself on such a reduction. That is another question.

But the reduction of rates carries with it other consequences well stated in the article from "Engineering," and which is by far the most intelligent pub-

lished in England on the subject. There must be greater mechanical speed of transmission attained, or a greater number of wires erected, or, as messages unlike letters in a mail bag must follow each other, great delay must ensue unless by some virtuous arrangement of the public to accommodate the government, despatches be brought in at all times as the wires can accomplish the task imposed upon them, and thus utilize the whole twenty-four hours of the day and night. What follows? In the one case greatly increased labor and cost with less pay, and in the other, an added night service which in a country like Great Britain, with limited area and quick railroad locomotion, the mails could far better and more satisfactorily perform.

The partly postal and partly telegraph idea looks well on paper; but, in America, and, we believe, even in England, would fail of successful employment. To places unreached by telegraph in America, the mails are infrequent, and the fact of the absence of telegraph facilities proves the existence of either a very small or of a very uncommercial community. Government could not do more in this respect in America than the Telegraph Companies, who receive messages to all points whether reached by telegraph or not, in the latter case by the simple addition of the charge for postage, or, when desired, for the cost of an express messenger. The vast range of our domain renders it impossible to establish a uniform tariff applicable to every place, so that stamped paper could be left at country towns for mailing to adjacent offices. To provide stamps of various denominations at such places is indeed possible, and might, at times, be convenient, but Telegraph Companies can do this as easily as Government, and in this there is no basis of a claim for greater efficiency or for any such advantages as would justify the change. It can be accomplished most easily by leaving with each Postmaster, or any other person, in small places where a telegraph office cannot be sustained, a tariff list from which he can collect on messages left with him, enclosing messages and amount to the nearest office and deducting his commission.

Just at this point of our writing, the synopsis of Mr. Washburne's bill for a Government Telegraph between Washington and New York comes to us.

**The Bill to Construct a Telegraph Line from Washington to New York.**

The bill introduced by Representative Washburne, of Illinois to-day, for the construction of a Government line, under the direction of the Post Office Department, between New York and Washington, provides:

That the Postmaster General shall within thirty days advertise in two newspapers in Washington, Baltimore, Philadelphia and New York proposals for constructing a Telegraph line from the Post Office in Washington to the Post Office in New York, by way of Philadelphia and Baltimore and such intermediate stations as he may designate. The Postmaster-General shall, at the time of opening proposals, also receive and examine any proposals from the proprietors of any existing line of telegraph for the sale to the United States of the entire line of such Telegraph between any two of said cities or for the entire line herein provided for, with all the franchises, rights and privileges connected therewith. The proposal of the lowest bidder is to be accepted and the work is to be of the best character. Power is given to the Postmaster-General to establish Telegraph stations at as many Post Offices along the line as in his judgment the public interest, with due regard to economy of administration, shall require, and shall employ in the business, as far as practicable, the employees of the Post Office, and also special Telegraph clerks, when necessary, at the customary salaries, and employ a general superintendent, who shall be a practical Telegrapher at a salary not exceeding \$3,500 per annum. No message shall be sent unless stamped with a three cent postage stamp. There shall be a uniform rate for the transmission of messages without regard to distance, of one cent each word, exclusive of the address and signature; but no message shall be sent for a less sum than ten cents, and there shall be charged two cents for the delivery of each and every message; provided the Government shall be entitled to send and receive all its messages over the line free of charge, and shall have priority in sending them; and provided that when less rates than are herein provided shall be

charged by any other Telegraph line between the same points, the Postmaster-General may reduce these rates to conform thereto; and provided further that he may direct that news telegrams for publication by newspapers shall be transmitted at a reduction not exceeding fifty per cent on these rates. Another section provides that persons tampering with despatches or making an improper disclosure of their contents shall be punished by a fine not exceeding \$1,000 or imprisonment not to exceed one year, or both, in the discretion of the court. The sum of \$75,000 is appropriated to carry out the provisions of the act.

The bill was referred to the Committee on Post Offices and Post Roads.

Here is a proposal for the erection of a government opposition line connecting the chief cities of the seaboard at one-third of the tariff which even the English Government propose to charge on despatches should the Telegraph system be allowed to come under its management. Its design is simply destructive of private companies. It is based on no ability to perform better service. It is predicated on one of the grossest errors ever presented to an intelligent people, that Telegraph Companies have selected only the chief cities for the opening of their offices, and that the whole system has been uncertain, expensive, and limited. It charges existing companies with infidelity to their trusts, rendering private and public business unsafe in their hands. "We see," says the report "the system in this country in the hands of rival companies, anxious only for extending their lines to prominent places where profits are to be secured, and indifferent to the public convenience!" We hesitate to use the word which should characterize such a statement. There is scarcely a town in any State, of any activity, and where a reasonable prospect has been given of paying expenses, which is not now, or in the near prospect of being thus supplied. It is true that the companies which have recently sprung into competitive existence, have based their success on attention solely to the business of large cities and a few active towns. It is not true, it is eminently false, when uttered respecting the older companies now united, so as by greater economy of management to make the widest application of the system possible, and whose offices are everywhere. How strange is such a statement in the face of facts like the following:

*The Western Union Telegraph Company keep open over two hundred offices which are not self-sustaining; over one hundred which do not average over one dollar per month, as many as two-hundred which do not average five dollars per month; and so on up. Its language is to all comers, to all towns, "show us that expenses will be met, and an office will be opened."*

But what is not true of the company referred to, is true of the proposal of Mr. Washburne. He selects the choicest territory for his scheme, the largest cities for his philanthropic experiment. He adopts a tariff which cannot meet expenses unless by salaries such as in England and Belgium and Switzerland, render operatives mere nonentities, poor, hungry and spiritless. If such a system is what this great nation wants—women earning \$2.33 cents a week, and men \$4.00 to \$5.00 a week, men, women and boys who dare not breathe a scientific thought or propose an improvement lest they magnify their office, and enhance their personal value, then we say to the 5,000 intelligent operators now filling worthily their several posts, and sustaining worthily positions in social life, be off to new engagements and let this great wash of a false philanthropy waste itself in a service which amid the false influences of political control, and a management shorn of all the stimulus of interest or enterprise, must lower the pulse of the whole nation in that which, notwithstanding all the statements to the contrary, has better represented our national enterprise, has with quicker and freer step traversed our entire civilization, than any of the undertakings which have set their mark on the American name and fame.

Take the city of New York for example. The Telegraph Company selects a central office for its

main business. Into this enter all its distant wires touching Nova Scotia, Montreal, Chicago, New Orleans and often San Francisco with a single flash. Three blocks distant, however, a knot of financiers are transacting business. They cannot spare three minutes to walk to the central office, and the company opens one for them in their own room. A few blocks further a circle of men are selling and buying wheat; the Telegraph Company plants an instrument which connects them direct with all the grain centres of the continent. In another corner one hundred men are yelling out the rates of gold and want to whisper rises and falls to their comrades along the seaboard; the telegraph company gives them half-a-dozen wires to reach them all. There is a hog market in the suburbs, and the drovers have wires given them. Oyster mongers, fish vendors, butchers, negotiators of vegetables, all have their offices assigned them. Every hotel of importance has its wire. The Union League Club asks a wire and has it. Tammany will have its own. A. T. Stewart has his wire, and Clafflin his. Every interest which human ingenuity rears to prominence, every community which passing events focalizes into excited masses, all have the swift wings of the telegraph put at their control. No less than seventy-three offices are thus provided for the permanent convenience of the public in the city of New York alone. So proportionally in all.

To accommodate the newspaper interest also a number of wires, otherwise unneeded, are kept up at great expense. A despatch of 10,000 words are presented at the Washington office which must reach New York in an hour, and it is done by giving half a dozen wires to its transmission. A wire is wanted at the Reporter's Gallery, it is given; at the White Mountains for a month or two, it is given; at the Light ship, it is given. On every side wants are met promptly and liberally.

Is it of any use to ask if Government could do all this? No! It is not inherent in the usual nature of its service. Government is a crocodile that cannot turn its body to the exigencies of such a service. It should at least neither defame the organizations which have achieved all this, nor by the selection of a rich field for its own experiments seek to impoverish and enfeeble them in their well appointed enterprises and designs.

Instead of the popularity claimed for European Telegraphs under Government control, the censorship to which messages are exposed is a subject of bitter execration. In France, in Spain, and in other countries the abuse of this power is notorious. The directors of the Paris Bourse have the first reading of every financial message. That it would not be equally odious in America we have no right to presume. In all periods of political excitement, with all the offices in the charge of partisans, Government control would be simply hateful. Official position with us represents a reigning party, not posts of labor assigned for simple merit and made permanent on account of simple capacity. The political element would in fest of necessity, every Telegraph station, and the friends of the reigning power be more or less admitted or be supposed to be admitted to its secrets. No political opponent could trust a confidential message to its transmission, and even if fidelity were possible, the fear of betrayal would be unavoidable. No sane man will doubt this. Actual purity of administration would not remove this dread. On the other hand we defy Mr. Washburne or any Committee which Congress may appoint, to prove the malfeasance which the preamble of Mr. Washburne's bill so broadly and sweepingly charges against Telegraph Companies, except in a degree so exceedingly exceptional, as to challenge public admiration for the general purity which has characterized the execution of their high trust.

We have authority for saying that the Swiss charge of half a franc per message does not meet

the expenses of the Department, nay, that the system is worked at heavy loss. All the Swiss railways belong to the Government and their agents, subject to service without additional pay. Postal service, by reason of the mountainous character of the country is necessarily slow, and the telegraph proportionally valuable.

The people are separated into Cantons, and their intermingling very limited. Their correspondence is confined to little more than that required by the necessities of commerce. The most munificent patrons are the tourists, of whom there are always multitudes, and the maximum of the revenue is derived from the through business from Italy to Northern Europe. Railway officials build its lines, carry on its repairs, watch, work, and manage them. In all these respects no parallel exists in America. Then again her offices only number 252. In the State of New York alone there are over twice that number; those of the Western Union Company alone, being over 500. The Swiss messages from all the 252 offices amount to three fourths of a million per annum; those of a single office of the Western Union Company, sent and received, to 1,400,000 per annum, exclusive of over half a million more passing through it to other places. A population consisting of isolated Cantons, separated by vast mountain ranges, with limited social intercourse, with slow postal arrangements, with everything to render the telegraph a needed appendage to the other means of communication, cannot supply any proper analogies to a land like either England or America where all the conditions are unlike and peculiar.

It is gravely stated in the preamble to the Washington bill, that in Great Britain, after a trial of twenty years, "the people of Great Britain, with singular unanimity, demand that the telegraph system be placed under the control of the postal authorities." We deny the fact. The public papers entitled to any consideration practically condemn it. The London *Times* demands more careful examination of the facts. The "Engineer" and "Engineering," the two ablest scientific papers in the world, condemn it. The only thing which can save it from utter failure is that excellence of the English postal service which no man can claim to have a counterpart in America, and which makes possible there, as it cannot here, the mixed telegraph and postal service proposed.

In England, however, Government does not attempt to destroy private interests as Mr. Washburne's bill proposes to do. Lines will be bought at fair values, not crushed out by Government pressure. Yet we have little faith in the lines of Great Britain passing from private control, and less of any extended grasp of them here, unless new conditions arise not now within our comprehension.

The propositions of the English Government are, in one respect, a singular revelation of an absence of centralizing wire arrangements by English Companies which we regard here as necessary, and which we cannot believe does not form a part of the English system. It seems very strange also to see Government proposing to supply every town with a population of 2,000 with telegraphic facilities, and that from 5,000 to 10,000 offices may thus be opened and iron boxes for smaller ones, as an added boon, when the Company claim that there are only 1,041 parishes in the Kingdom with a population of 1,500 unsupplied with telegraph facilities. What kind of wild data can have made such a statement possible? No, we cannot wonder at any such displays of official ignorance after perusing documents written by those among ourselves, who have every facility for knowledge of what they write, and yet whose public announcements are devoid of the courtesy which should characterize every attempt to interfere with industrial pursuits, and of truth itself.

Should Mr. Washburne get his line built from

Washington to New York, which is to be built at a cost of \$75,000, we shall see what "he will do with it." Will he give the public of New York seventy-four offices at which to grasp the warm hand of the Illinois Congressman and deposit its ten cents and postage stamp? Will he give Philadelphia thirty-five such offices, Baltimore nineteen, Washington sixteen? Or must we go to the Dutch Church on Nassau street and take our chances in the long file of clerks and anxious ones who wait in its filthy corridors for their chance to buy stamps, counting upon their silver watches their chance of losing the mail? Will this \$75,000 line ever give us, as now, a page of close newspaper matter in an hour?

The great trouble with all these efforts to do good service for a suffering public, arises from two fundamental errors: 1. Despatches are regarded as letters with which a bag can be filled, and, whether many or few, can be bundled along to their destination together with no greatly increased cost, and with no material additional consumption of time, however multiplied. 2. That a day is twenty-four hours when it is for practical purposes only five or six. And there is no use proving these things to our grand public benefactors, for these are the facts which would prick the bubbles by which fame ascends, and which, as they must burst sometime, we may as well give all the liberty of space and air they may demand.

In the matter of accountability also, the public have rights which will not unwillingly be surrendered. True, danger has obliged Telegraph Companies to claim a limitation of their responsibilities. There is a limitation demanded by the very nature of the business and the extraordinary elements employed in its transaction. But there is a measure of responsibility in damages for failures or negligence constantly made to be felt, and which so affects the possibilities of the success of the system, as to cause the most sleepless vigilance, a constant care and anxiety such as no other pursuit on earth evokes. All men know that in Government hands, such a pressure would practically cease. Why, it is not necessary to inquire; the fact must be conceded even in advance. The whole experience of the companies who connect in business with the European Government telegraphs prove the utter uselessness of appeal even in cases of the most flagrant neglect. A claim presented against them, even for a lost message, is met with a dumbness as profound as if made against the oyster beds of Chesapeake Bay. It would be not less so here.

We must be allowed to say in conclusion that this scheme in which, while charging that existing companies fail to reach the poorer and outlying distant communities of our land, selects for its own operations the most productive and best provided section of the entire country, is a thrust at private rights and a method of enterprise unworthy of the nation, and for which the money of the people should not be used. Only one thing would reconcile us to its adoption, and which if adopted, will induce us at once to surrender all opposition. Let the line be built and maintained by taxing the cities it connects or the men who vote for it. With such a rider attached to the bill, this great philanthropic design will vanish into thin air, as do the soap bubbles of delighted children as they evaporate from their sight to be seen no more forever.

*From the New York Evening Post.*

#### Government Going into Business.

In the House of Representatives on Monday, Mr. Myers, of Pennsylvania, introduced a joint resolution, which was referred to the Committee on Appropriations, "appropriating \$2,500 to defray the necessary expenses of experiments by Seth Green in the artificial propagation of shad and other fish in the rivers of the United States—the money to be ex-

pended under the supervision of Francis E. Spinner, Treasurer of the United States."

The business of artificially propagating fish already engages the capital and attention of several persons in this country; and will no doubt attract more and more capital, as it is developed, and succeeds in supplying the market with a necessary and favorite food. Mr. Seth Green, was we believe, one of the first to undertake the artificial breeding of fish in this country; but others have been quite as successful as he, and we can see no reason why Congress should give Mr. Green \$2,500; or if it does this, why it should not present a like sum to every other person engaged in the same business.

But, on the same day, Mr. Washburne, of Illinois, introduced in the House a bill for the construction of a Government Telegraph Line, under the direction of the Post Office Department, between New York and Washington.

Referring to the bill as given elsewhere: Here we find the Government, which already has about as much as it can do to collect revenue and see justice done, asked to go also into the business of telegraphing. It is not only to set up an opposition Telegraph line, but it is to undersell the present private corporations; and thus the whole power and capital of a Government of forty millions of people are to be openly pledged to drive out of business, if they can, a private company of citizens.

Why should the government set up and manage telegraph lines? Has it more money in the treasury than it knows what to do with? Are the people anxious to be taxed more heavily? Have the government officers at present employed so much idle time on their hands that they need to manage telegraphs to keep them busy?

The bill proposes that the government shall build and own a telegraph line between Washington and New York; but does any one imagine the job will stop there? Why between Washington and New York? Will not Boston also demand a government line; and New Orleans, Charleston, Cincinnati, Chicago, San Francisco, have not all these, not to omit Toledo, an equal right with Baltimore or Philadelphia to a government telegraph line?

Moreover, if the government should go into the telegraph business, why not into the express business also? The Postmaster-General now sends letters, therefore he ought, according to the friends of this project, to send also telegraphic despatches; so, as he carries small parcels, he ought on the same grounds to go into the express business. In the same way, as the Secretary of the Interior surveys and sells the public lands, would it not be well to have him also fence them, plough them, plant them with corn and wheat, or perhaps with oranges and bananas? So the Secretary of the Navy has a number of steamers under his control. Why should he not undertake the conveyance of passengers and goods from one port to another, with a provision that he shall always charge a little less than any private shipowner?

Why is it not far better to leave all these affairs to be conducted by private enterprise? Are the people so prosperous and so lightly taxed that they would like to pay the cost of telegraph lines all over the country? Are government patronage and office seeking so excellent and elevating that it is useful to increase both enormously, by adding largely to the number of men employed by the government? We have now a government Post Office, and everybody who wishes to send a letter in a hurry employs a special messenger, or a private dispatch post; is it likely that the government telegraph will be better served than the government postoffice?

It is quite natural that persons who have for some years urged what is called "protection," that is to say, government favoritism of particular interests at the expense of the whole country, should also favor

the establishment of all sorts of enterprises by the government. But we suspect that the people, who already pay as heavy taxes as they can bear, will not tolerate the imposition of new taxes, for such absurd and unnecessary purposes.

*From the New York Tribune.*

The project for a National Telegraph line between New York and Washington, to be owned and controlled by the Government, does not commend itself to our favor. We do not see what the Government has to do with enterprises of this sort, nor has its success in carrying the mails been such as to encourage it to attempt any more labor of the same character. All such work had better be left to private corporations, who will do it more cheaply, promptly, and honestly than we can hope to ever have it done by public officials. If the Government is to carry messages and letters, why should it not carry other things? Why should not the Secretary of the Interior control all the railway lines, and the Metropolitan Police have a monopoly of the New York market-expresses?

#### Death by Electricity.

*To the Editor of the Chemical News.*

SIR: I perceive you have a paragraph on the above in your last number of the *Chemical News*, being an alleged new form of capital punishment, by a writer in *Harper's Weekly*.

I beg to inform you that I am the original proposer of the above; in June, 1863, I suggested to the Conservateur des Abattoirs a Paris this method for slaughtering cattle; through insufficient address, this letter was returned to me by the "dead letter office." February 17, 1865, you published my suggestion in the *Chemical News*, page 84.

In May, 1866, the Royal Society for the Prevention of Cruelty to Animals wrote to me that "they will be glad to appoint a deputation to attend any experiments I may desire to make, and that they will procure the permission of a butcher for the trial." This fell through because I had neither the apparatus nor the time to carry it out.

In 1866 I proposed this scheme to His Grace the Duke of Richmond, to be used instead of hanging, in capital punishment, conjointly with the suggestion that executions should take place in private, for which I gave my reasons why I considered it more expedient than the present mode. I also used the following words: "Simultaneously with the shock, the wretched being would pass into eternity without a pang."

I have condensed my letter as much as possible, and in conclusion beg a place in your journal, in common fairness to myself.

I am, etc.,

CHARLES N. ELLIS.

WOLVERHAMPTON, April 29, 1868.

#### The Gold Medal to Cyrus W. Field.

A bronze copy of the gold medal to be awarded to Cyrus W. Field, by the Act of Congress, has been received at the Treasury Department, and was today exhibited by the Secretary at the Cabinet meeting. The model was designed by J. Goldsborough Bruff, of the Treasury Department, and was executed at the mint at Philadelphia. It is regarded by the Secretary of the Treasury, and competent judges, to be superior in design and execution to any other medal ever produced in this country, and is, of itself, evidence of the present efficiency in the artistic department of the mint.

THE Office of the East India Telegraph Company has been removed from 55 Liberty street, to 23 & 25 Nassau street, New York.

**Telegraphers'****Mutual Life Insurance Association.**

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

D. R. DOWNER, Secretary.

J. D. REID, Treasurer.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

**DIRECTIONS TO APPLICANTS.**

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

IMPROVED TELEGRAPH INSTRUMENTS,

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed. His Relays were awarded

**THE FIRST PREMIUM**

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them. Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

**PRICES.**

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	18 00
Main Sounders, same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and Good Lever Keys.....	22 00
Excellent Key-sets.....	40 00
Post Sounders.....	6 75
Keys.....	4 50 to 6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package.

He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers prices.

NO. 14.

NEW YORK, JUNE 1, 1868.

VOL. I.

We find the following on our table, and hasten to give it to our readers.

## HIGHLY IMPORTANT.

### Congressional Grocery Control Bill.

Whereas the system in this country "of providing the people with the necessities of life is in the hands of grocers, anxious only to extend their 'business' whence profits are to be secured, and indifferent to the public convenience," and, whereas governments are established for the good of the people, and not for the enriching of one class at the expense of the masses, and whereas the majority of the people are consumers, and therefore the victims of the aforesaid class of grocers, who grow rich at the expense of the rest of the community, and, whereas the government by its capital and exemption from taxation can defeat all private enterprises, and thereby supply the poor people of this country at less than the cost of said articles to said grocers, and, whereas the post-office department carries parcels for less than any Express company, therefore, be it enacted that the Post-Master General advertise in two newspapers in Washington, Baltimore and New York, proposals for establishing grocery stores in each of said cities. The Postmaster-General shall at the time of opening proposals, also receive and examine any proposals from grocers having existing groceries for the sale to the United States of the entire stock and fixtures of such groceries, together with the good-will of their said business. The proposal of the lowest bidder shall be accepted, and his stock is to be of the best character. Power is given the Postmaster-General to establish corner groceries in each and all of said cities, as in his judgment the interests of the public shall require, and shall employ in the business as far as practicable the employees in the Post office, who shall when not engaged in distributing letters make themselves useful in selling groceries at less than cost prices. There shall be a General Superintendent, who shall be a practical grocer and good politician, at a salary of not less than \$3,500 per annum. All goods purchased at said groceries shall be sold at one-half the wholesale prices of similar articles, and shall be paid for in stamps. No quantities of less value than two cents shall be sold at said corner groceries, provided nevertheless that all supplies for the government officials and their friends shall be furnished free, and their wants shall be first supplied, and, provided that if any grocer or any combination of grocers shall attempt to compete with said government groceries, it shall be the duty of the Postmaster-General forthwith to reduce his rates to conform thereto, and use the public funds to crush individual enterprise: and the sum of \$750,000 is hereby appropriated to carry out the provisions of this Act, and such further sums shall be added thereto as may be requisite and necessary to carry into effect the aforesaid benevolent scheme to protect the poor people of our large cities from the cormorants who are so indifferent to the interests of the poor as to keep store for the purpose of gaining a livelihood.

The above bill will supply places for all who are

in want of office, it will provide the poor with food at the expense of the public, it will meet the wants of the masses who need food at less than cost price, and make them more comfortable in their condition. It will not be subject to the objection of having their plans and purposes all known to officials like the espionage of the Telegraph, and mistakes in selling groceries will not subject the people to the loss entailed by a mistake in telegraphing, and though politicians are proverbially impracticable, careless and lazy, the masses will have the means of ascertaining their fidelity, and will by their clamors make them industrious in supplying their wants. There will be less letter writing and more buying of groceries at these government stores. Further, we are an agricultural people, and this enterprise of Uncle Sam will compel the people to till the earth if they wish to escape starvation, instead of engaging in commercial pursuits, which do not increase the productive wealth of the country, thereby we shall fulfil the destiny of man, and eat our bread by the sweat of our brow.

### New Magnetic Motor.

The practical working of a new electro-magnetic motor was exhibited yesterday afternoon in the lecture room of the College of the city of New York, Lexington avenue and Twenty-third street. It is the invention of Laban Clarke Stuart, and it is claimed that it will produce a power which, in various ways, can be used to supply the place of manual labor. Professor Doremus explained to the large audience which had assembled to witness the experiment, the principle of the invention, and how electricity was made available and utilized in the matter. A series of magnets were longitudinally arranged in an armature, or open case, about three feet long, so that they could be connected at pleasure, by a wire, with a battery in the basement, which consisted of forty cups. When the current was turned on the magnets were so ingeniously placed in connection that they revolved rapidly like an axle. The current was continuous, provision having been made to avoid the inconvenience of breaking it in order to produce motion. This magnetic axle, so to speak, turned a small wheel, and the wheel, which was only about seven inches in diameter, worked the piston rod of a pump by which water was raised nine feet. It would be rated in the market at a quarter-horse power, but it is not actually so much. It can be increased however, in proportion to the extent of the battery and the size of the magnets used. The cost of working the motor exhibited yesterday is fifteen cents an hour. Professor Doremus said it is in advance of anything of the kind which has yet been produced, and can be turned to practical account in various mechanical operations.—*Sun*.

In order to approach the railway bridge over the Mississippi, connecting Dunleith with Dubuque, the Illinois Central railroad have found it necessary to undertake the boring of a tunnel 900 feet long, through solid rock. This formidable undertaking has been left to the Rock Island contractors, and they have already commenced operations.

## Correspondence.

### The Profession.

To the Editor of The Journal of the Telegraph:

SIR:—It has always appeared to me to be a subject for regret, that the personal experiences of Telegraph operators, experiences gained by years of laborious application to their business, should be suffered to go unrecorded, and the profession be without their possessions. In common with the great masses of Operators, I was placed in charge of an office, when I was utterly ignorant of the duties required of me. Of even the most elementary truths in the science of electricity I was totally destitute, and the sum total of my acquirements in the art of telegraphy, consisted in my capacity to send or receive messages, and a knowledge of the mechanical structure of the key, which in one of my curious moments, I had completely analyzed. Not having had the advantage of a previous scientific education (and how many young operators do have?) I found the acquisition of information in regard to my profession, to be truly a "pursuit of knowledge under difficulties." The entire absence of any book which could be taken as a Manual of the Morse Telegraph, together with the fact that there was then no periodical devoted to Telegraph, left me no way, however willing to "live and learn."

These early experiences of mine have been recently brought to my mind, and it has occurred to me that a few suggestions through the columns of the *Journal*, might be productive of some good.

The profession of Engineering, of which our own is a branch, has long had periodicals devoted exclusively to its interests in the collection and distribution of facts and figures respecting the art; in addition to which Engineers have formed together numerous societies, where the members may exchange their experiences; the records of which are published yearly. The consequence of all this is, that no engineering work of any prominence in any part of the world, has been executed for years without a full and circumstantial account of it being published, and in the possession of all who are interested.

Telegraph Operators have no such societies, but we have the *JOURNAL*, and I am confident that you, Mr. Editor, will refuse admittance to no article, however humble its pretensions, which relates the result of experience in that part of the profession of which it treats. Of the many thousand readers of the *JOURNAL*, there are few who could not communicate something which would be valuable, while there are many whose experience would be a very mine of treasure could they but be induced to bring it to light. I will not occupy your space with an unnecessary amplification, but what a store-house of information would be the *JOURNAL* when it should constantly record the daily observations of Operators all over the country! If of nothing else, at least of the detection and location of unusually different "crosses" "escapes" "grounds" and faults of all kinds. Details of the effects of atmospheric electricity; results of experiments with batteries, instruments, &c.; account of construction of lines;

statements of observed facts which are not understood, and which probably could be explained by another, &c.

But I feel that if I do not close abruptly I shall grow tiresomely long, and after all each Operator is by far the best judge of what he can speak of, and cannot possibly derive benefit from any suggestions in the matter from

your most obedient servant,  
T.

St. Louis, May 8th, 1868.

*Dear Journal:*—During the past few days the weather in this section of the country has played all sorts of pranks, varying from extreme heat to heavy thunder storms and whirlwinds which annoy the public generally and the telegraph fraternity in particular. Yesterday was extremely cold and blustering with an occasional shower. Omaha reported a heavy snow storm west of there, on the W. P. Road, blocking up trains, &c. Just think of snow in May. It sounds as unnatural as strawberries in December, but not half so pleasant. This morning, however, old Sol is out radiant as ever, and there is every prospect of delightful weather for a week or two.

It is understood here that the W. U. Company have made arrangements to construct a new line on the St. Louis and Iron Mountain R. R., from the end of the present line at Pilot Knob to Columbus, Ky. The Railroad is not finished, but is being rapidly constructed, and it is hoped that another year will give St. Louis a direct Railroad and Telegraph connection with the South by this route. The same company has also commenced work on a new line on the Madison County Railroad from the Junction of the St. Louis and Indianapolis Railroad to Edwardsville, Illinois. This line is built under contract with and along the line of the Railroad.

Edwardsville is a flourishing little town of four or five thousand inhabitants, but has never yet had telegraph communications. Its residents are of course highly pleased with this arrangement.

Johnny Dwight, one of the finest telegraphers in the United States, paid us a visit a week or two ago. Many of your Eastern readers will be glad to hear he is the picture of health. Mr. E. H. Brown, our very popular manager, has been granted leave of absence for a short time, to attend a Baptist Convention at Baltimore, Md., to which he has been sent as a delegate from St. Louis. Mr. Brown's responsible and laborious duties as manager of this office, do not prevent his taking a very active part in Church affairs, and for some years past he has had charge of a large Sunday School.

W. H. Monro, late manager of the Topeka, Kansas, office has been transferred to Fort Sedgwick. W. E. Vigus succeeds Mr. Munro at Topeka. George H. Crain has been appointed superintendent of a division of the North Missouri Railroad in addition to his duties as railroad telegraph superintendent. Mr. Crain is quite a young man and until recently was an operator on the line which he now has charge of.

It may be well to observe here as an incentive to operators, that among others who have worked their way up from the lowermost round of the ladder, are the General Superintendent of the Illinois Central railroad, who worked for a number of years on the Caton lines, and was recognized as a first class telegrapher; and the Vice-President of the Cincinnati and Indianapolis road, who for a number of years "pecked brass" in the Cincinnati office of the Western Union Company. One of the division superintendents of the Mo. Pacific road is also an old operator, who worked for quite a while on the Ohio and Mississippi lines. Another division superintendent of this road has learned to operate and has had their wires connected with instruments at his residence on the road. The assistant superintendent of

the Southwest branch railroad of Missouri, has also learned to telegraph and can transmit dispatches, as can the general superintendent of the Iron Mountain road, who has a paper instrument in his office.

Speaking of these old fashioned instruments, a conundrum has just struck me. Not having substance enough about it to strike it back, I'll do the next best thing and inflict the punishment on your readers. "Why is a paper operator like an illiterate stranger sending a telegram? The one receives by register, the other registers by receiver." As Pat remarked, "If it aint good, it's original."

Stanton who is sitting at No. 4, wants to know "why he is like the *N. Y. World*?" Receiving no reply, he has the audacity to answer, "Because I am trying to raise Seymour!" Stewart ally remarks, "it's hard work." VOYAGEUR.

#### Discharging Operators.

To the Editor of the Journal.

For the last nine months we have been watching the progress of your valuable paper. We cannot help from recognizing its benefit to "Telegraphers" and hope its success may continue. But, there is still something which might be added. From what we see of your paper, we are led to believe it is published for the benefit of the operators and the company. We make the following suggestions: 1st. Whenever an operator is dismissed from the service of the company for dereliction of duty, or any other charge made by his Dist. Supt., let him (the operator) have a chance through your valuable paper of vindicating himself. This is nothing more than an executive officer would ask in case he was removed. 2d. In case the Dist. Supt. sustains himself before his Gen'l Supt., let the complaining operator be discarded from the profession, and *vice versa*. When we take in consideration the extent of the W. U. Company at this date; imagine the power of a District Superintendent, who may for some petty spite not only refuse to give him a letter of recommendation, but even refuse to extend the courtesy of his line to an operator, who, he (the District Superintendent) may have thrown out of employment. And again, telegraphers as a class are now verging on old age, i.e., those who are old in the business—and it is now too late for them to learn another profession. These matters may appear unimportant to a man who has a good position, yet to one who is out, it is a matter of very great importance. From what we know of you, we are satisfied you are working for the common good of the science and employees thereof. Our earliest recollections revert back to you as one who always encouraged us in our boyish days as a messenger.

Yours, ZTLOV.

Corbandoles, Montgomery  
Co., Tenn., March 25, 1868.

THE New York State Association of Editors and Publishers will hold its next annual Convention at Watkins, on Thursday, June 25th, 1868. The annual address will be delivered by the Rev. Thomas K. Beecher, of Elmira, and a practical lecture given upon the mechanical part of the printing business and the general management of a country newspaper, by Marcus H. Rogers, Esq., of the *Berkshire* (Mass.) *Courier*. The second day will be devoted to an excursion on Seneca Lake, and a visit to the celebrated glens in the neighborhood.

In a letter from Paris, the following statement is made in reference to the Cooke automatic instrument. "In a practical experiment by competent persons, there was but one error in 15,000 words, which were set up ready for printing at the rate of 14½ words per minute. The rate of transmission is an average of 80 messages per hour, although capable of sending 120.

#### Lady Operators.

MR. EDITOR: Your "typo" makes me say *human* emigrants in my last, instead of *German* emigrants! He must have been studying the "humanities."

The practical hint of your correspondent, "W. W. K.," in No. 11, "puts me in mind of a little joke" sometimes played off by messengers. I mean, collecting twenty-five cents or so, more than the charges, or collecting charges, when the message was prepaid, of course pocketing the "sum of the difference."

It is very annoying to have an acquaintance return home, and ask you why his message had to be paid at *both ends*! But "such is life." Now, I think it might be prevented, by using two kinds of envelopes for delivering messages. On the face of those used for paid messages, have printed in plain type: "*This message is prepaid. No charges for delivery.*" On those used for "collect" messages, have printed: "*Charges on this message are ———. Do not pay the messenger more.*" If the recipient could read, and *did* read those notices, he could not well be "bled." Of course, in "collect" messages, the amount to collect would be plainly written on the blank space. I am very glad Mr. Editor, to see you take up the cudgels in defence of "Lady Operators." I think it is a poor indication of the "pluck" of our fraternity, to see a lot of six-footers (yes, some six foot three *and a half*) put their heads together, and say, "We do not consider a woman capable of becoming a good operator." We might say, in answer, "and if not, why not?" Because they won't give her a chance. But I don't think it is necessary to combat their assertion at all. Supposing (which I don't) that a lady, with the proper education and experience, could *not* become a proficient in the art, what need have the said six-footers to bother their heads about the matter? They are not asked to employ and pay them. It is the *Company* who must run that risk, and surely we must allow them to do their business as seems best to themselves. The true reason of the opposition is easily seen, and that is, the knowledge that lady operators can do the work cheaper than the sterner sex. And there is no denying that when female operators are more plentiful, and better acquainted with the business, that second and third-class operators will have more trouble in getting situations. But I do not believe that any one who can establish a reputation for steadiness, attention to business, and a fair amount of practical dexterity in the art, will ever want for employment; because in a business employing such a great number of persons, there always must be a great many who do not give perfect satisfaction, and when a good *reliable* man (or woman either) is known to be "in the market," superintendents will generally take the chance to work him in, and get rid of one of their makeshift men. But let us look at it in still another light, and I appeal to you, brother operators, as fathers, husbands, brothers, and as *men*. Look at the multitudes of poor women reduced to the verge of starvation, eking out a wretched existence by sewing, for wages that would not pay for *one quarter* of the cigars that an operator will use—at the numbers who are driven to worse, for want of *any employment at all*—at the still greater number who are forced to accept the most repugnant situations for want of any other kind, *all* because there are so very few employments in which a female can obtain a respectable living. Can we, in the face of all this, stand up and say, "*We will not allow females to become operators, lest they take the bread out of our mouths*?" I say, all honor to yourself, Mr. Editor, for having opened the door for their admission, and I hope you will see the time (and if you live long enough, you *will* see it) when female operators will challenge your champion key-holders, and *beat them*.

G. S.

FREDERICK, MD., May 5, 1868.

**Delivery of Despatches.**

MR. EDITOR: Will you permit one who has all along taken a lively interest in the telegraph, particularly in its relation to the business world, to occupy a little space in your valuable journal, upon a subject perhaps a little threadbare, but none the less important. I particularly desire to make your journal the medium through which to convey to the fraternity what I have to say, as it has come to be regarded as the standard for general information relative to the business. The subject to which I wish to refer, and to which my attention has been directed more than once of late, is no greater than the delivery of messages. To some this may appear as a trivial subject for a newspaper article, but when we reflect that after all the labor and money expended in furnishing facilities, and "getting messages through," we finally confide them to boys to finish, to deliver, the importance will be manifest.

The telegraph business is made up of details, and no part is too small not to deserve earnest and ample thought and attention. In the delivery of messages it is not possible to give too much care, nor too great attention. The rules of the Western Union Company one would think sufficient to guide all, yet it is often found that the managers are satisfied with simply entering messages in the messenger's book, and trusting to him for their delivery to the proper persons, procuring the proper receipt and the time. I do not mean to question the integrity of the messenger, for once in the life-time of the writer he "has been there," but his experience at that time convinced him that a little boy might be over-awed by a man, or that an unprincipled person might assure the messenger that he was the right man, in order to get possession of a message, or that his "watch had run down" as a reason for not writing the time. The foregoing brings me down to the statement of a few simple directions which in my opinion would prove beneficial if carried out. A "messenger's delivery book" should be kept in every office, no matter if not more than one message in a week, or a month is received for delivery—whether *paid* or *free* should always be entered in the delivery book, with the "time sent out," and a receipt taken with the "time delivered." *The person receiving the message* should write the "time" after his signature. Without such care what security would any telegraph company have? How many who read this article can remember six months back at what time any one particular message was delivered? If compelled to answer in Court it could only be done by reference to the messenger's delivery book, and if that was not in *good order*, and the "time" written in the same hand as the signature of the person receiving the messages, it is very doubtful whether it would be received in evidence. I know that at some offices where the man in charge serves in the triple capacity of Express agent, Ticket agent and operator, and deals with seemingly larger things, taking a receipt for a "little despatch," when he "knows everybody and everybody knows him," is not thought worthy of attention, but as cases are arising daily wherein proof is required that despatches were delivered promptly, and to the right person, it becomes necessary for every one to guard carefully against any failure to secure the company and themselves. When messages are delivered at hotels the clerk should be required to sign his own name, and not the name of the house. I have only touched on the leading points, and leave the subject to the reflecting to follow up. The whole may be summed up in this: managers and operators should always have by them, in their offices, good and sufficient evidence of having performed their part, and this can best be furnished by means of carefully preserved "messenger's delivery books," with messages entered under proper dates, and the signature and "time" of the person to whom they were addressed.

Mr. Reid—I hope the subject matter of this communication may strike you as favorably as it has me—I am not capable of writing a newspaper article, but the necessity of calling the attention of managers and others to the subject impressed me, and I ventured. Don't hesitate to cut it down, or tear it to pieces, only I hope the matter will not be lost sight of entirely.

Yours very truly,  
WM. A. DAVID.

**Automatic Telegraphing.**

BOSTON, May 25.

BY M. F. ADAMS.

In a late number of the TELEGRAPHIC JOURNAL, I noticed a long and interesting article on improvements in Automatic Telegraphing, the innovation of M. M. Chaudassaignes and Lambricat, two French telegraphers. The system is similar to that of Mr. Alexander Bain (i. e.) the decomposition of salts upon chemically prepared paper, but has more of a resemblance to the system of Mr. Hummiston a New York gentleman, who in 1855 tried his apparatus between that city and Boston.

In this arrangement a long band of paper was punched out in Morse signals by means of a very complicated and ingenious machine, operated by a key board similar to that of a combination printing instrument.

This paper was passed between two metallic rollers moved by clock work, one of the rollers being in connection with a battery. The line wire was connected with a spring which pressed against the paper and was thus prevented from coming in contact with the roller beneath, but when a fissure in the paper occurred the spring came in contact with the roller and placed the battery upon the line which produced a blue mark upon the chemically prepared paper at the other terminal of a certain length, according to the length of the fissure in the transmitting paper. Owing to a defect in the machinery this invention did not prove as successful as expected.

The difference between this arrangement and that of the Messrs. Chaudassaignes and Lambricat is that they transmit the signals by means of a metallic band prepared with insulating ink which opens and closes the main line circuit and produces Morse characters upon chemically prepared paper at the distant station, but with the exception of their method of preparing the transmitting paper it will be seen that these two systems are identical.

The trouble of preparing the paper for transmitting signals and the translation of these signals has been the great drawback to the usefulness of this mode of Telegraphing, and I am of the opinion that these methods will never come into genuine use, at least not in America.

Mr. T. A. Edison of Boston, has recently invented a very practical automatic apparatus which is both ingenious and curious; the arrangement is very simple and not so liable to get out of order as the methods described above. The arrangement is as follows: A transmitting Morse Register is placed at one end of the line, and a receiving register at the other, the first register has no battery attached, but is merely used for the purpose of running the paper through. The front standard of this register is connected with a battery, and the armature with the line, the transmitting paper is prepared by operators upon registers placed in local circuits, and when thus prepared, they are cut off in suitable lengths and run through the transmitting instrument at a very rapid rate. This paper in passing between the rollers of the transmitting register by its thickness prevents the armature from touching the standard, but when an indenture in the paper occurs, the pen of the register passes into the groove which allows the armature to come into contact with the standard, and

places the battery upon the main line, reproducing the Morse signals at the other terminal; this paper is passed through as rapidly as it can be prepared by two operators upon registers as local circuits.

The indented paper at the other end of the line, is then cut off in suitable lengths and passed at a slow pace through two re-writing registers similar to the Morse line transmitting registers, with the exception that the armature and standards are connected with a sounder and local battery, and the writing is received by sound. It will be seen that the indentures in the paper depress the armature and act as a key upon a main or local circuit: thus nearly eighty words per minute can be sent and received upon sounders by two operators at each end of the wire, which is, I think a more convenient mode of transmitting and translating than of the Messrs. Chaudassaigne and Lambricat.

**Dont like Automatics.**

OPILEKA, ALA., May 8, 1868.

MR. EDITOR:—In your paper, May 1, you speak of Automatic telegraphing, and upon the subject I would respectfully ask your attention, not that I desire to suggest any improvements of the Automatic machines, but on the contrary to say that I don't want any such "masheen" on my tables. The relay, the key and sounder answer my purpose, and my reasons are expressed thusly:

I learned the business on a Morse key, register and relay at old M. S. in Ky. You know the manager there, (J. B. G.) Well, after awhile I dispensed with the register, and took unto me a sounder, which was nicer, you know, and no trouble, saves the trouble of having high tables, big boxes of paper, and the whizzing and buzzing of cog wheels and taking machines to pieces and oiling it, as if you were running a locomotive. Now all you want is plenty of soft paper, good pencils or pens and good ink, and good clips and just say to the sender "wade in," (not President Wade when an operator runs all over Cleveland to find him), and there you have it. Your Automatic machine must be fed with paper, and must have a puncher, and no doubt other endless things, and may take strong battery, and be more expensive. No sir, Mr. R., some fellow has an axe to grind, let him furnish his own stone, I'll take Morse in mine all the time.

I merely express myself to you and not for the public, for I have no time to write, revise and hunt up classic language for publication, and have no ambition to see words in print.

Very truly, Yours,  
JOHN H. PURNELL.

**To the Journal of the Telegraph:**

Sometime since wide publicity was given to the story that a gentleman in London wishing to obtain entrance to a telegraph office situated at the top of a high building locked inside on the ground floor, went to an adjoining station and sent word by the way of Glasgow, from which point there was direct communication, back to London, and up to the above office for the man on duty to come down and admit them; but a little incident occurred here last week, which rather more ludicrously shows to what great lengths people will sometimes go for a very insignificant purpose. An operator working the Pittsburg wire, wishing some "Solace" from a brother operator on the Cleveland circuit, and being too busy (?) to step across the office, a distance of but 25 feet for it, sent the following despatch to Pittsburg, whence it went to Cleveland, thence back to his chum in N. Y.

To K——, N. Y.

"Send me over a chew" Sam.

In about 3 minutes the latter was contented with his cud, and the boys wondered how long a paid message, in its usual course, would have occupied in going the same round.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 8,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, JUNE 1, 1868.

The English Telegraph Control Bill will be brought before Parliament, Wednesday, June 3d. This we learn by cable in answer to an inquiry respecting recent newspaper announcements of the abandonment of the project.

We are compelled again to omit a large quantity of matter designed for this issue. The illustration of Mr. Gillespie's Key, which he notified us of having sent, and for which we provided, we have not received.

### Protection of Despatches.

As the conduct of the Western Union Telegraph Company, in surrendering to a congressional committee certain despatches demanded of them, has been somewhat widely criticised, and exaggerated statements made thereof, the following explanation is deemed proper.

1. It is an error that the Congressional Committee called for or were furnished with the general files of the Telegraph Company's office at Washington. Certain despatches specifically described, so far as that was possible, were demanded by the committee, and were furnished upon written requisition.

2. The authority of that committee, or any other committee, constituted by Congress to examine persons and papers, is so unquestionable, and so much greater even than that asserted by courts of justice, which invariably claim of Telegraph Companies instant production of despatches when demanded, that compliance with their requisition was unavoidable, and refusal would have been useless contumacy. In the case of *Briggs vs. Mackellar*, Abbott's Reports, vol. 2, referring to the same power as held by the English Parliament, Mr. W. C. Noyes uses the following language:

"I do not refer to the power of Parliament as a court, but simply as to its legislative power; and in that respect it is said in these authorities (Cornyn's Digest, &c.), that its power is not limited, but is absolute as to all things and persons."

Judge Daly, in his response to the same counsel, says:

"I understand it to be well settled that either House in the British Parliament may examine witnesses for any purpose connected with legislation, either before the bar of the House, or by appointing a committee with power to examine the witnesses; that if a witness refuses to obey the order of the chairman of the committee, &c., application may be made to the House, and the witness committed for contempt, or imprisoned at the discretion of the House, &c. The same power is adjudged to exist in all municipal governments, modified, of course, by the particular constitution of each municipality and laws of the State. So potent is the power that a commitment by the House of Commons, without assigning any cause for it, except the party's contempt, cannot be enquired into. The Court of King's Bench invariably refused to discharge prisoners so committed. The Commons' Committees are the Inquisitors for the whole realm, and they may inquire into all subjects and bring witnesses before them on matters of religion, justice, &c. (Com. Dig. Tit. Parliament, E. 6, 4; Inst. 11.) *Rex vs. Abbott*, 14: East. 148, 151; *Rex vs. Gassett*, &c."

In the charge of Judge Daly in the same case, he uses the following language:

"In American legislatures the investigation of matters before committees, preliminary to legislation, or with the view of advising the House appointing the committee, is, as a parliamentary usage, as well established as it is in England, and the right of either house to compel witnesses to appear and testify before its committees, and to punish for disobedience, has frequently been enforced. The right of either House to examine witnesses before its bar, or before a committee authorized to send for persons and papers, or for a person authorized by a committee to take testimony, as well as the power to punish, for contempt, in case of disobedience, is expressly provided in the statute. (Rev. Stats. 376, 4 ed.: Pt. 1, ch. 7, tit. 5.)"

In Brightley's Digest of the laws of the United States, vol 1, page 190, the following extract from the act of January 54, 1859, is given:

"Any person summoned as a witness by any committee of either House of Congress, who shall wilfully make default shall in addition to the pains and penalties now existing, be liable to indictment as and for a misdemeanor in any court of the United States having jurisdiction thereof."

In volume 2, Brightley's Digest, page 92, power is given even beyond that of courts of justice, as follows:

"No witness shall hereafter be allowed to refuse to testify to any fact or to produce any paper touching which he shall be examined by either House of Congress or any committee of either House, for the reason that his testimony touching such fact, or the production of such paper, may tend to disgrace him, or otherwise render him infamous."

These citations should be ample vindication of the Telegraph Company for the delivering of the messages in question. It might have made capital for itself and earned a temporary eclat among portions of the people, had it defied the power of Congress and allowed its President to be immured in the vaults of the Capitol or the Tombs for contumacy; but prompt obedience to a power which invests all courts with whatever authority they have, and all of which claim the right concerning which complaint is now made, seemed the clear duty of the company, and to evade which would have only given another useless and mischievous example of disobedience to the laws of the nation. The despatches were given up after obtaining the advice of the most eminent counsel, none of whom hesitated to recognize the authority under which the demand was made.

The public may be led to believe from some of the recent publications on the subject under review, that the production of messages in the manner demanded by the Congressional Committee is new and unusual. The truth is, that it is a matter of almost daily occurrence, every court in the country claiming the right to order the production of despatches in connection with suits under trial.

The Telegraph Companies interpose every obstacle consistent with respect for judicial authority. The original is never left with even the judge, except on compulsion, and neither original nor copy is ever shown, except in court, to any one but the sender or the party addressed. Courts have gone so far as to demand the production of messages sent by third parties, and which the Western Union Telegraph Company, by employment of special counsel, has resisted, as dangerous to the interests of society. In no case, however, no matter how skillful the plea made by the Company, has it ever been able to evade the demand of any court for the production of despatches. In this it calls, on behalf of the people, for the highest legislative intervention. In a bill now before Congress having this object in view, the Telegraph Companies call for, and every where sustain the closing article, and which, we hope, may soon become a part of the public law.

"H. R. 846, Sec. 15.—And be it further enacted, That every message or despatch delivered for transmission to any such telegraph company shall be held and deemed a confidential communication made to such company by the person or persons so delivering the same; and it shall not be lawful for any such company, or the president, directors, officers, servants or agents thereof, or for any of them, either in pursuance of any order, subpoena, writ or process, or otherwise, to deliver, produce, exhibit, or allow inspection of any such message or despatch, or of any part of the same, or of any copy thereof, or to communicate or disclose the contents or

meaning thereof, or of any part thereof to any courts, judicial tribunals, officers, or persons, or any of them, other than the persons by whom the same shall have been delivered, or to whom the same shall have been originally addressed, or his or their agents; and it shall not be competent for any court officer or judicial tribunal, by any subpoena, writ, process, or otherwise, to compel such delivery, production, exhibition, inspection, communication, or disclosure: Provided, however, that in case of suit or other proceeding against any such telegraph company, its officers, agents or employees, or any of them, for damages for any fault, delay or failure in the transmission or delivery of any telegraph message, it shall be lawful for such telegraph company its agents or employees, to produce any message or communication which may be material or necessary to his or their defence."

This enacted, no improper exposure of despatches will thereafter be possible.

As the officers and offices of the W. U. Company have more or less intercourse with Canada, we are requested to remind all concerned, that the postage thereto has been reduced to six cents, if prepaid, and twelve cents if paid by receiver. Managers of Offices will please notice.

The advertisement of S. C. Bishop, offering to Telegraph Companies an insulated pole line cordage, and insulated outside office wires deserves serious attention. There must be an immediate deliberate effort made to remove existing difficulties to the working of lines in our large cities. An article which makes this possible is a valuable addition to the appliances by which perfection is made attainable.

Bliss, Tillotson & Co.

126 South Clark street, Chicago, Illinois.

A change in the advertisement of L. G. Tillotson & Co., gives us the opportunity of saying a word about that firm, which we have always been ready to say in private, but have been somewhat chary in committing to paper. There are some things we regard as taken for granted. We do not flatter the sun for his regularity, or the ocean for its profundity. It is of no use complimenting a fat man on his good nature, for epigastrical rotundity and heartiness are congenital. So when the name of a business firm has, by long years of carefulness and push, become a synonym for success and reliability, it seems like painting the lily to be reiterating what every body knows.

The establishment of the house of Bliss, Tillotson & Co., (a very happy conjunction of names), at 126 South Clark street, Chicago, however is an enterprise which calls for special note. It is one of the indications of the mighty advance of population in the west which demands a house in Chicago for the provision of Telegraph supplies and repairs without the necessity of sending to the seaboard. It will meet a great want and, for that reason, must be a success.

Its management will be in the hands of Mr. Geo. A. Bliss, an experienced electrician and a most worthy gentleman. We ask attention to their advertisement, and commend the two houses to the public with earnestness and cordiality.

The houses thus opened and co-operating, have their addresses as follows:

BLISS, TILLOTSON & CO, 126 SOUTH CLARK ST., CHICAGO, ILL.

L. G. TILLOTSON & CO., 11 DEY STREET, NEW YORK.

The latter being the new and more accessible premises recently opened in New York, to which we called attention in a former number, and which will remain under the personal management of Mr. Tillotson. The best way to appreciate that gentleman, is to "walk into his parlor" where he will give assurance of all the pleasant and courteous things which we spare his modesty from spreading more largely on paper.

## OFFICIAL STATEMENT.

Western Union Telegraph Company.

APRIL, 1868.

Receipts	\$602,257.05
Expenses	\$356,349.18
Net profits	\$245,907.87

## A Great Want Supplied.

BISHOP'S CENTRAL TELEGRAPH DEPOT-

We commend Mr. Bishop and his very liberal enterprise. Both inventors and manufacturers can have complete confidence in his honor and liberality. We endorse him cordially.

BISHOP'S TELEGRAPH ROOMS,

113 LIBERTY STREET, NEW YORK.

TO MANUFACTURERS OF TELEGRAPH AND ELECTRIC INSTRUMENTS AND APPARATUS:

I have opened Rooms in the building now occupied by the BISHOP GUTTA PERCHA COMPANY, No. 113 Liberty street, N. Y. City, for the Reception and Exhibition of every kind of

TELEGRAPH AND ELECTRIC APPARATUS,

to be kept open Every Day, and properly attended to, and the articles on exhibition taken care of by me.

I invite you to send me any articles of your manufacture, properly labeled, with your name.

The charge for space and care of Instruments, etc., will be ten per cent. of your saleable price, for the year.

Insurance, if required, will be charged extra.

Exhibitors will at all times be admitted to the Rooms with their customers to show samples, and sell from them, free of charge.

N. B.—Battery power will be supplied for testing, etc.

Respectfully,

SAMUEL C. BISHOP.

New York, May 30, 1868.

## OFFICE OF THE

BISHOP GUTTA PERCHA COMPANY,

113 LIBERTY STREET,

SAMUEL C. BISHOP, General Agent.

INSULATED POLE LINE CORDAGE

AND

OUTSIDE OFFICE CONNECTING WIRES.

We have completed some valuable Experiments, and have now the pleasure to offer to Telegraph Companies, and others interested,

THE BEST

AIR LINE

AND

OUTSIDE OFFICE INSULATED WIRES

that can be had

Parties using are invited to examine them at our Office.

SAMUEL C. BISHOP,

May 30, 1868.

General Agent.

STICKWELL & CO'S  
EXTRA MUCILAGE  
THICK, CLEAR AND ADHESIVE

Who has not used

STICKWELL'S MUCILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the Parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding "or any other man." It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOURS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, 8OZ. CONE, 8OZ. FLAT, 8OZ. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES  
S. S. STAFFORD,  
Sole Proprietor, N. Y.

## TARIFF BUREAU.

Semi-Monthly Circular.

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
June 1, 1868.

To all Offices on W. U. Lines—

The following changes have occurred since May 15th, the date of the last Tariff Order. Please note them in your Tariff Book:

## NEW OFFICES.

Anna, O., tariff same as Sidney, Ohio.  
Chelsea, Vt., tariff same as South Royalton, Vt.  
Chicopee Falls, Mass., tariff same as Chicopee, Mass.  
Drakes Branch, Va., tariff 2 50 from Louisville, Ky., and 1 00 from Washington, D. C.  
Fayville, Mass., tariff same as Marlboro, Mass.  
Forester, Mich., tariff 30 more than to Port Huron, Mich.  
Foster's Station, Pa., tariff same as Brady's Bend, Pa.  
Hartland, Vt., tariff same as Windsor, Vt.  
Highland, Ill., tariff 10 more than to Chicago, Ill.  
Idaho, Col., tariff 25 and 2 more than to Central City, Col.  
Lewistown, Mifflin Co., Pa., tariff 25 added to the rate to Harrisburg, Pa., or 30 added to the rate to Philadelphia or Pittsburgh, Pa. The rate which is found to be lowest after adding as directed, will be adopted.  
Marion Junction, Ala., tariff same as Marion, Ala.  
Morristown, Ind., tariff same as Shelbyville, Ind.  
Point du Chene, N. B., tariff same as Shediac, N. B.  
Port Sanilac, Mich., tariff 30 more than to Port Huron, Mich.  
Reading, Mass., tariff 30 more than to Boston, Mass.  
West Point, Ind., tariff same as Attica, Ind.

## OFFICES OPENED ON OTHER LINES.

Blandville, Ill., tariff 85 and 4 from Chicago, check Chicago.  
Clarkville, " tariff 75 and 4 from St. Louis, check St. Louis.  
La Harpe " tariff 55 and 3 from Chicago, check Chicago.

## OFFICES CLOSED.

Fort Morgan, Col., Ruffin, N. C., Scottsboro, Ala., and South St George, Me., business for the latter office will hereafter be checked to and delivered from Tenant's Harbor, Me. Milan, Tenn., (temporarily). Bufords, Va.

The following changes in tariff to points on line of Pennsylvania R. R. will take effect June 1st. The tariff from W. U. Offices will be obtained as heretofore, by adding the rate to Philadelphia, Harrisburg or Pittsburgh to the rate from those points, but instead of making the tariff by the "most direct route" as per circular of January 2d, 1868, the *cheapest* route will be adopted.

	From Philadelphia.	From Harrisburg.	From Pittsburgh.

The public are cautioned against purchasing these Bonds, as payment has been stopped.

A reasonable reward will be paid for their return to the owner.

WM. HUNTER,  
86 Liberty Street.

We regret to learn that by a disastrous fire which occurred on Thursday last, in Boston, the premises of Charles Williams, Jr., the widely and well-known manufacturer of Telegraph machinery, were so damaged as to involve him a loss of from \$3,000 to \$5,000, on which however there is ample insurance. The whole force of Mr. Williams' establishment is now engaged cleaning up and repairing his injured machinery, to which will be added new facilities for a largely increased business, and prompter supply of articles ordered. We gladly give publicity to this announcement, so that the many patrons of Mr. Williams may know why orders are delayed, and to say a kind word for a house which deserves well of the public. In two or three weeks the establishment will be again ready for business. By this fire, M. G. Farmer loses \$2,000. No insurance. W. H. Remington loses a large stock of Thermo Batteries. No insurance.

**A Bill to Enable Her Majesty's Postmaster-General to Acquire, Work, and Maintain Electric Telegraphs.**

Whereas the means of communication by Electric Telegraphs within the United Kingdom of Great Britain and Ireland are insufficient, and many important districts are without any such means of communication:

And whereas powers have been from time to time granted to certain companies and persons to lay down, maintain, and work lines of Electric Telegraphs within the United Kingdom of Great Britain and Ireland; but there is nothing obligatory upon such companies and persons to exercise their powers within any particular district or place:

And whereas it would be attended with great advantage to the State, as well as to merchants and traders, and to the public generally, if a cheaper, more widely extended, and more expeditious system of telegraphy were established in the United Kingdom of Great Britain and Ireland, and to that end it is expedient that Her Majesty's Postmaster-General be empowered to work telegraphs in connection with the administration of the Post Office:

May it, therefore, please your Majesty, that it may be enacted; and be it enacted by the Queen's most Excellent Majesty, by and with the advice and consent of Lords Spiritual and Temporal, and Commons, in the present Parliament assembled, and by the authority of the same, as follows:

It shall be lawful for Her Majesty's Postmaster-General and he is hereby authorized, with the consent of the Lords Commissioners of Her Majesty's Treasury, from time to time, *out of any moneys which may be from time to time appropriated by Act of Parliament and put at his disposal for that purpose*, to purchase for the purposes of this Act, the whole, or such parts as he shall think fit, of the undertaking of any company, and any undertaking, and all other property purchased under the powers of this Act, shall be vested in and held by Her Majesty's Postmaster-General, in his corporate capacity, and his successors: provided always, that no such purchase be made, and that no agreement for any such purchase be binding, unless the said agreement, accompanied by a minute from the Commissioners of Her Majesty's Treasury, in which the grounds of the agreement shall be set forth, shall have lain for one month on the table of both Houses of Parliament without disapproval.

Any Company, with the authority of two-thirds of the votes of their Shareholders present in person or by proxy at a general meeting of the Company specially convened for the purpose, may sell all or any portion of their undertaking to the Postmaster-General for such sum of money as may be mutually agreed upon between the Postmaster-General and the Company; and the execution by any company under their common seal of a conveyance to the Postmaster-General, duly stamped, of their undertaking, shall be sufficient to vest the same in the Postmaster-General for all the estate, right, title, and interest of the Company therein, with all incidental rights, privileges, and easements, and the same may be used, exercised, and enjoyed by the Postmaster-General in the same manner and to the same extent as the same respectively are, or if this Act had not been passed might be held, used, exercised, and enjoyed by any Company, and the receipt of two of the directors of any Company for the purchase money, endorsed upon the deed of conveyance, shall be a sufficient discharge for the same to the Postmaster-General, who shall not be bound to see to the distribution thereof.

The acts, charters, and grants of any Company, whose undertaking shall be sold and conveyed to the Postmaster-General under the powers of this Act, shall (except as far as they are by this Act expressed

to be varied or repealed, or are inconsistent with the provisions of this Act), remain in full force, and all matters to be done, continued, or completed, or which, but for the passing of this act, would, might, or could be done, continued, or completed by the Company so selling their undertaking, their officers or servants, shall, or may (as the case requires), be done, continued, or completed by the Postmaster-General, his officers and servants, and those acts, charters, and grants shall be construed as if the Postmaster-General had been named therein instead of the Company so selling their undertaking.

If the Postmaster-General shall acquire any one undertaking under the powers of this Act, he shall, upon the request, in writing, of any Company possessing an undertaking established by special Act of Parliament at the time of the passing of this Act, purchase the undertaking of such Company, upon terms to be settled (failing agreement) by an arbitrator, to be appointed by the Board of Trade, provided such request be made within *twelve* calendar months after the Postmaster-General shall have so acquired any one undertaking; and any Railway Company possessed of a Telegraph open to the use of the public on the first of January, one thousand eight hundred and sixty-eight, for transmitting messages for money, or possessing any beneficial interest in such Telegraph, shall be included in this provision, and any such Railway Company shall be entitled upon a like request, in writing, to require the Postmaster-General to purchase the right of such Railway Company to transmit such messages or other beneficial interest.

It shall be lawful for Her Majesty's Postmaster-General, with the consent of the Lords Commissioners of Her Majesty's Treasury, from time to time to lease any part or parts of the undertaking or property purchased or acquired by him under the powers of this Act.

The Postmaster-General, with the consent of the Commissioners of Her Majesty's Treasury, may from time to time make regulations for determining the hours during which the offices appointed by him to be places for the receipt and despatch of messages shall be open for the transaction of Telegraphic business, and for fixing the sums to be from time to time paid for the transmission of messages, and for services rendered in connection therewith, and for the general conduct of Telegraphic business: Provided always,

(1.) That the charges for the transmission of messages throughout the United Kingdom shall uniformly and without regard to distance be at a rate not exceeding *one shilling* for the first twenty words of each message, or part of twenty words, and not exceeding *sixpence* for each additional ten words or part of ten words:

(2.) That the names and addresses of the senders and receivers of messages shall not be counted as part of the words for which payment shall be required:

(3.) That the sums charged for the transmission of messages shall be held to cover the costs of delivery by special foot messenger, within *one* mile of the Terminal Telegraph Office, or within the town postal delivery of that office, when it is a head Post Office, and the town postal delivery extends for more than a mile from it:

(4.) That when the addressee does not reside within the above described limits, and the sender desires to have his message delivered by special foot messenger, the charge to him for portage by such special messenger, beyond such limits, shall not exceed *sixpence* per double mile, or any part thereof:

(5.) That when the addressee does not reside within such limits, and the sender does not desire to incur the cost of special delivery, his message shall be delivered free of extra charge by the ordinary pos-

tal delivery next following on the arrival of his message at the terminal Telegraphic Office.

The payments to the Postmaster-General for the transmission of telegraphic messages from one place to another within the United Kingdom shall (except for portage) be made in all cases by means of stamps, and the Postmaster-General shall cause a proper supply of stamps and stamped paper to be prepared for that purpose, and kept for sale to the public at such of the Offices under his control as he may think fit to appoint for that purpose.

Besides appointing Offices to be places for the transmission of Messages by means of the Electric Telegraph, the Postmaster-General may, if he thinks fit appoint Offices or Pillar Letter Boxes to be places of deposit for messages, and the messages deposited therein shall, provided they be written on stamped paper of the proper value, or on paper having stamps of the proper value affixed thereto, be conveyed to the Offices of Transmission without extra charge, at such times as the ordinary collections of Post Letters are made from the aforesaid places of deposit, and shall forthwith be despatched by telegraph from the Offices of Transmission.

Copies of all regulations from time to time made under the authority of this Act shall be laid before both Houses of Parliament within *fourteen* days from the date thereof if Parliament be then sitting, and if not sitting then within *fourteen* days from the next reassembling of Parliament, and all regulations so made shall be binding on the parties interested in the subject matter thereof to the same extent as if such regulations formed part of this Act.

HARTFORD CITY, May, 1868.

To the Editor Journal of the Telegraph:

SIR: Having noticed your intention to receive those contributions whose tendency is to elevate and edify, we send you the result of our observations. As a member of the great fraternity, we have observed that among us there is a want of attention to a better arrangement and disposal of surplus time. We are aware that our remarks cannot apply to all, but to say nothing of those who not only work early, but "see far into the night," are they not applicable to the majority whose loose estimate of time is shown in the dissipation of injurious literature. Are we living up to our opportunities? As one constituent part of society, we think we can furnish our *pro rata* of intelligence, but in proportion to our privileges we do not excel as we might. When removal has become necessary, have we not felt that the possession of the necessary qualifications to place us beyond the caprice of others, would be a source of strength to us? If Ferguson could study astronomy while a shepherd boy, and become a great astronomer, and Hugh Miller find time from the monotony of a stone mason's life, to make for himself an immortal name—shall we do nothing? The biography of great men prove that the genius of patience and perseverance is their motive power. If we display our latent energies in the right direction, and redeem the time, we may be able to stand in the day of our calamity independent.

Truly yours, &c.,

A. A. F.

**The Shadows of Life.**

The shadows of the mind are like those of the body. In the morning of life they all lie behind us; at noon we trample them under foot, and in the evening they stretch long, broad and deepening before us. Are not, then, the sorrows of childhood as dark as those of age? Are not the morning shadows of life as deep and broad as those of its evening? Yes, but morning shadows soon fade away, while those of evening reach forward into the night and mingle with the coming darkness.

## Telegraphers' Mutual Life Insurance Association.

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

J. D. REID, Treasurer.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

### DIRECTIONS TO APPLICANTS.

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

IMPROVED TELEGRAPH INSTRUMENTS.

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his  
work in a style and of a quality that are unsurpassed.  
His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their  
superiority is generally acknowledged by operators who use them.  
Aside from the advantages apparent upon inspection of these  
instruments, their acknowledged merits consist in the construction of  
the helix, which was patented August 15, 1865. This being of naked  
copper wire, so wound that the convolutions are separated from  
each other by a regular and uniform space of the 1-800th of  
an inch, the layers separated by thin paper. In helices of  
silk insulated wire the space occupied by the silk is the 1-150th to  
the 1-300th of an inch; therefore a spool made of a given length and  
size of naked wire will be smaller and will contain many more con-  
volutions around the core than one of silk insulated wire, and will  
make a proportionably stronger magnet, while the resistance will  
be the same.

## PRICES.

Relays with helices in bone rubber cylinders, very fine	\$19 50
Small Box Relays	16 00
Same in Rosewood	17 00
Medium Box Relays	17 00
Same in Rosewood	18 00
Large Box Relays	18 00
Main Sounders—same as the above, with heavy arma- ture lever, without local connections	75 cents less
Pocket Relays, with all the adjustments of the above	22 00
and Good Lever Keys	40 00

NO. 15.

NEW YORK, JUNE 15, 1868.

VOL. I.

## LOOK OUT!

**Instruction in Telegraphing—Confidential Communication from the President of a Business College—How he secures situations for his Graduates.**

The following letter will be read with much interest by telegraphers, and with much greater interest by the persons now studying at the Buckeye Business College. The utter baseness of the proposal to make engagements for students in the manner proposed should be enough to shut the doors of this Buckeye College for ever.

THE GREAT SYSTEM OF ACTUAL BUSINESS TRAINING.

OFFICE BUCKEYE BUSINESS, TELEGRAPH }  
AND PHONOGRAPHIC COLLEGE, }  
SANDUSKY, O., April 27. }

To —, Superintendent Telegraph :

DEAR SIR—I have a practical telegraph college here, and have on hand about sixty students that I graduate at receiving twenty-five words per minute, and as you have been highly spoken of to me, I think I would like to make arrangements with you to give or get situations for my graduates. I have one young man that is now ready. I will give you \$10 for every situation you get for me. I care not whether it is a night or day office, what the salaries are, or if the student is not kept longer than a week, just so it is a situation.

I would like you to take the contract to furnish all of the whole sixty students employment as soon as they have graduated. I assure you I will not send you a man unless he is a No. 1 business man as well as a good sound operator. I have worked twelve years at telegraphing, and believe I know when a man is fit for a railroad or commercial office.

Hoping to hear from you very soon on this matter, I remain, sir, with much respect, very truly yours,  
S. P. HARR, President.

## THE PAGE PATENT.

**A New Telegraph Patent for old Inventions.**

*From the Scientific American.*

The direct claim of Professor Page, as set forth in the law, was for the invention of the induction-coil apparatus, known among telegraphers as the Ruhmkorff coil; but the patent covers much more than this. It embraces the "employment of one electro-magnetic instrument to open and close the circuit of another electro-magnetic instrument, using either one battery for both or separate batteries for each," which is, in fact, the famous "local circuit" years ago patented to Prof. Morse; the "combination of an automatic or mechanical circuit breaker with either a primary coil alone or a primary and secondary coil combined," invented and patented by Royal E. House; the "employment of separate and independent batteries to operate an electro-magnetic circuit breaker and the circuit which is broken by it," which is the famous "repeater" patented by Mr. Hicks; and, indeed, covers all automatic closers, repeaters, local circuits, and all points of value known in the electro-telegraph business.

The bill and the patent founded upon it are outrageous impositions upon the public, and will not for a moment stand the test of the courts. It is singular that Prof. Page's name should never have been known and associated with these inventions,

and that as Examiner of Patents for many years he should have passed favorably upon the claims of those who have secured patents for these very discoveries, which he afterward claimed to have originated with himself. The Morse and House patents have expired long since, and by limitation of law their inventions have for years been public property. The Hicks patent has yet some years to run. The truth is, the bill bears upon its face evidence of having been the work of lobby legislation, and the patent is glaringly absurd, unjust, and illegal. We understand that an effort is being made to induce some of the telegraph companies to buy up the pretended rights of Prof. Page's heirs; but we advise them to keep their money in their pockets and to take no notice whatever of the claim.—*N. Y. Herald.*

[In connection with this subject we present a letter written by Prof. Page, only a few months before his decease, to the editor of the London *Scientific Review*, in which he frankly admits that priority of invention in respect to the circuit breaker belongs to Prof. McGauley.—*Eds. Sci. Am.*]

GILLESPIE'S SELF-CLOSING KEY.—See page 5.

Prof. Page, of the United States Patent Office, in a pamphlet recently published on the history of the induction coil, shows clearly, by documentary and other evidence, that Ruhmkorff has no claim whatever to any merit in respect to the invention of the coil which bears his name. Not only were all the principles on which the action of the coil depends, discovered long before Ruhmkorff embodied them, but even the details of the apparatus had all been invented and described, and not only so, but a complete, nay, a more powerful apparatus, had been made and exhibited in Paris. This apparatus was constructed by an American, Mr. Ritchie, who modestly attributes its merits to the researches and discoveries of Faraday and others, who had made electro-magnetism their study. It was exhibited in Paris to many scientific men, and was actually taken to pieces by M. Ruhmkorff, an instrument maker, so that its construction might be thoroughly understood. A few years afterward M. Ruhmkorff obtained the Imperial Prize of 50,000f. awarded by a commission of men eminent in science, to the author of the most important discovery concerning the application of electricity. Among the members of this commission were gentlemen who had seen Mr. Ritchie's coil, but who found it convenient to forget it. The French journals awarded to Ruhmkorff all credit for the invention, and refused to publish explanations of the real facts of the case, forwarded to them from scientific gentlemen in America. Du Moncel, Ganot, and other French writers on the subject of this in-

vention, though they were all fully conversant with the truth, and though some of them were present at the experiments with Ritchie's coil, and even at its dissection, have carefully ignored any apparatus of the kind as a competitor in merit with Ruhmkorff's.

In pleasing contrast to conduct like this, we turn to Professor Page's frank and honest acknowledgment of merit to those who had anticipated himself in some very valuable inventions relating to induction apparatus. Among the gentlemen credited with such inventions, the late Professor McGauley, who was so long connected with this journal, and whose recent death created so much and so well-merited sympathy among scientific men, is prominently mentioned. We remember that on several occasions Prof. McGauley mentioned in his modest, unassuming way, that he had invented what was called the Ruhmkorff coil, but we never had an opportunity of ascertaining the details of his claim. Now, some months after his death, information comes to us across the Atlantic, which connects his name with the history of induction apparatus, for it appears from the evidence furnished by Professor Page, that Professor McGauley was the first to invent and apply

the automatic contact breaker, the type of all now employed in such apparatus. A coil fitted with such a contact-breaker, was exhibited by Professor McGauley, at the meeting of the British Association in 1837, and a description of it was published in 1838, among the proceedings of that body. It appears that Prof. Page, who was himself engaged in working out induction apparatus, independently invented a similar but more complete contact-breaking

apparatus early in 1838, having had no information as to McGauley's invention. Yet Prof. Page, with the true modesty of science, frankly awards to Prof. Gauley all the honor of priority in this matter. Not only so, but having heard of that gentleman's death, and of the exertions made on behalf of his bereaved widow and children, he has written to Sir David Brewster, the chairman of the McGauley Memorial Relief Fund, the following letter, which we now publish, and which will be read with the melancholy interest attached to all connected with the great name of him, now no more, to whom the letter was addressed:—

UNITED STATES PATENT OFFICE, Feb. 6th, 1868.

DEAR SIR:—Noticing the death of Professor McGauley, mentioned in the *Scientific Review*, I take the liberty of sending you a book on Induction I have recently published, in which I have had occasion to make honorable mention of his name, in connection with an invention of interest and importance, of which he was undoubtedly the originator. The hammer circuit-breaker, which has been so extensively used in connection with Induction Coils all the world over, has been in England, France, Germany, and Europe, generally attributed to Dr. Neef, of Frankfort-on-the-Main. In this country it has always been accredited to me, as I invented it at least six months in advance of its introduction by Dr. Neef. My investigations, however have traced it to Professor McGauley as the original author, and it appears to me somewhat singular that Dr. Golding Bird omitted to mention the originator's name when he brought the apparatus before the London Electrical Society. He simply said "it was not his own invention." It cost me a considerable search to find it out, but I have proceeded upon the principle of according to every inventor and discoverer his just dues, regardless of personal and national consideration. If this discovery in his favor should be of any benefit in raising means

for his family, I shall rejoice and feel proud that my humble efforts to do justice to a co-laborer in the cause of science have met with such a reward.

With great respect and esteem, I am, very respectfully, yours,  
 CHARLES G. PAGE,  
 Chief Examiner of Patents.

Sir David Brewster.

## Correspondence.

### A School of Telegraphy.

To the Editor Journal of the Telegraph:

SIR.—The recent editorial notice which you made in regard to the establishment of a Telegraph School in one of the Western States, induces me to hope that the subject of professional education is not, as many would have us think, a subject for professional opposition. At the present time there are but few subjects which engross so large a share of the attention of distinguished scientists throughout the world as this of technical education; all nations, even our own, see and acknowledge that while the "race is not to the swift, nor the battle to the strong, both are to the *skilled*. Never before has appeared so pointed the application of the maxim that "Knowledge is power;" truly while "Time is prejudice," "Intellect hath conquered Time." It has long been my earnest desire to see the standard of scientific acquirements among telegraph operators raised; for it is useless and foolish to disguise the truth that as a body, our profession is lamentably deficient in even the most elementary parts of electrical science; and this ignorance must necessarily be continued so long as the present system of education is persisted in. It seems to be taken for granted that the sum of the requirements of a perfect operator shall consist in his capacity to send and receive messages, and in making his copy plain and clear; but as lines *will* occasionally get into difficulties with each other, the superior intelligence of some is made available, and as "chief" operators they—do the best they know how.

As the battery constantly emits disagreeable fumes, and is extremely dirty and unpleasant to clean, it naturally, under this system, falls to the care of an Hibernian who, whatever may be said of his uncertainty as to the nature of his materials, is yet thoroughly awake to the fact that an insufficient supply of force on the line can almost always be remedied by the addition of cells. To this party is also frequently given the duty of the "reconstruction" of the line, and having usually a "policy" of his own, some of his repairs bear in them the impress of genius perhaps, but *not* electrical genius.

If we are in the future to have greater reliability and despatch in business, existing lines are to so reduce their expenses by superior economy in working as to defy competition; if telegraph lines are to be kept out of the hands of the government, they must be worked by educated men.

In the mere mechanical points, but little improvement can be hoped for. Reading by sound, originating in America, has been perfected here; if the trials of speed recently made had taken place five years ago, or were to take place five years to come, the results would be similar. It may, and perhaps will, be that mechanical transmission will be succeeded by mechanical reception, and that the human machines now employed in such service, will be turned adrift; but we must always have *Telegraphers*. To create *brains* is as impossible as to originate *force*.

I will pass over the many schools or so-called colleges that have professed to teach in three months the "Science of Telegraphy (by the way Telegraphy isn't a science, but an art; electricity is a science), because they have all done little but furnish the profession with a multitude of such indifferent graduates as has well earned for them the distrust of practical men, with, in many cases decided opposition, and, not to occupy too much of your space, I shall sketch as briefly as I can a plan of elementary

instruction, which if properly worked out, would, I am convinced, furnish a groundwork upon which subsequent study would found a most substantial superstructure of professional knowledge.

The basis of all, and perhaps the *only* true science is mathematics. Sir David Brewster used to laugh at the idea of a study of exact science not preceded by a knowledge of mathematics; and some of the hardest of Faraday's work, and it is said one of the very few of his mistakes, was due to his lack of the higher mathematics.

In the limited time which I propose for the school term (six months), I have reason to believe there could be taught with reasonable thoroughness, in algebra, to and through quadratic equations, including, of course, the binomial theorem and progressions. In geometry, the first four books of Legendre, with such parts of the remainder as should show the manner in which areas and volumes are determined.

In trigonometry, the use of logarithms and the solution of plane triangles and trigonometrical formulae.

In mechanics, rigid demonstrations of the laws of the composition and decomposition of forces.

That pupils should be able to express their ideas graphically, the elements of geometrical drawing, such as sections, side and end elevations, and plans, should be taught.

In experimental science the nature of matter and force with their mutual relations, the physics of heat and static electricity, should be followed by a course of illustrated lectures upon chemistry, which, in addition to general principles, should particularize and explain such of the elementary bodies and their compounds, as are commonest in use in telegraphy. Simultaneously with the chemistry should come the fullest exposition of the principles and laws of galvanic action that the time will permit. In this department no pains nor expense should be spared to have the illustrations as perfect and as *illustrative* as possible. It would be supplemented by magnetism and electro-magnetism, and these in their turn be followed by an exact and careful series of lectures to show the relation of all the forces to each other, and their entire indestructibility as *force*. These lectures should close the school term, but while they were in progress, their immediate relations to practical telegraphy should be shown in the largest possible explanations in telegraph engineering, in which that *reasons* may be taught, instead of mere facts, the lecturer should have the assistance of ample apparatus, and a full collection of all telegraph material in general use in the United States. Finally the school should be furnished with a small laboratory, and with a library that should contain *all* the works of standard merit, as well as the very much larger collection of indifferent books which can be readily obtained.

There are many I know, who will think that I have mapped out an amount of work, which it would be impossible to finish in the allotted time. To such I would say that the outlines merely, and the essential facts with their reasons so far as known, would be taught. No man's education can be finished in six months or six years, but in six months the course I have proposed could be gotten through; and I make this assertion not hastily nor unadvisedly, but after thought upon the subject, and in the light of some slight personal experience, both in teaching and being taught, in the majority of the very studies proposed.

It is, of course to be understood, that while the science of the profession is thus engaging the attention of the school, daily exercise in sending and receiving business would be had, and there are but few persons of proper age, who, after a carefully watched practice of six months, would be unable to take charge of an office, where messages are occasional and not continuous.

In conclusion, however, it is due to myself to state that I have no expectation of speedily seeing such a school in operation. The expense incident to starting and carrying it on, would not be slight, and but few young men would feel justified in spending six months of their life and half a hundred dollars of money for the prospects of determined opposition which would meet them upon graduation. If such a school is opened, it appears to me that it must be by a telegraph company itself, who possessing all the facilities for teaching, can at the same time ensure situations to such of their pupils as shall pass a satisfactory examination, securing, to their infinite advantage, trained skill to relieve mechanical stupidity.

With many thanks for your kindness in hearing me, I am, Mr. Editor,

Most respectfully,  
 A TELEGRAPHER.

May, 30th, 1868.

### The Anglo-Mediterranean Telegraph Company

Mr. Cyrus Field, whose name is imperishably bound up with the Atlantic cable, is now associated with some of the first men of the day for the purpose of securing a direct and thoroughly efficient line of telegraph to Egypt, and thus permanently establishing a substantial part of the direct telegraph line from England to India, recommended by the Parliamentary Committee on East India communications.

The prospectus of this Company is now before us, from which it appears that a contract has been entered into between the Company and the Telegraph Construction and Maintenance Company for the purchase, in perfect working order, of their special land line from Susa (where the French telegraph lines terminate) to Modica in Sicily, a distance of about 1,300 miles. This line, which is now on the point of completion, has been constructed under a concession of forty years from the Italian government, and will be worked throughout by the English clerks of this company.

The contract with the Telegraph Construction and Maintenance Company also provides for the making, laying, and delivery to this Company in perfect working order, within four months, of a deep sea telegraph cable, capable of transmitting messages at a speed equal to the existing Atlantic cables laid by them, having an external covering suited to the known requirements of the Mediterranean bed, from Malta to Alexandria, a length of about 900 nautical miles, where it will be connected with the existing land lines to Cairo and Suez, and includes a working arrangement for securing to this Company the transmission of the through traffic between the French frontier and Suez. The contract obliges the contractors to maintain the cables in an efficient state for twelve months.

The English government have promised, in consideration of an annual payment of £2,000, for a term of fourteen years (to be made by this Company), to pick up the present imperfect communication by the shallow water Shore Line between Malta and Alexandria, and so long as this Company's line is efficiently worked they will not lay any competing line from Malta to Alexandria.

The existing telegraph between Sicily and Malta is by a cable belonging to the Mediterranean Extension Telegraph Company, with whom a tariff for the transmission of through messages has been agreed, and negotiations are now pending for laying a duplicate cable between those points. The Telegraph Construction and Maintenance Company have agreed, if required by this Company, to lay the duplicate cable and also a duplicate line across the Straits of Messina, undertaking to maintain them in efficient working order for twelve months, for the sum of £10,000.

To the Editor Journal of the Telegraph:

PHILADELPHIA, April 28d, 1868.

DEAR SIR:—I was very glad to see in a late number of the Journal a favorable editorial notice of College Telegraphy, for I have lately been thinking of opening a School of Telegraphy myself. My plan would be to teach Telegraphy as a branch of Engineering—what it really is, and, having no influence with Telegraph Companies, I should not teach manipulations at all—depending for patronage upon those who being already Operators desire to become Telegraphers. Chemistry; electro chemistry; the physics of heat, static and dynamic electricity, and magnetism, and meteorology, telegraph engineering (construction and maintenance of lines and apparatus) and Electro-Engineering to be taught by lecture. Mathematics and geometrical draughting taught each man separately according to his capacity and need. In three months' time I should deliver rather more than one hundred and fifty lectures, illustrated copiously by experiments, and with students acquainted with the four fundamental rules of arithmetic, would finish arithmetic, the first four books of Legendre's Geometry; the solution of plane triangles and of Trigonometrical formulæ, and in Algebra through Quadratic Equations, Drawing of sections, elevations, plans, etc., of telegraphic apparatus; something which every man who may have to describe machinery should always be able to furnish.

My idea is, you see, to put in a three months' term, a course of genuine Telegraph Engineering. To teach the causes of phenomena, and how their effects may be calculated, and sought or avoided, according as they would be favorable, or the reverse. Testing of lines, instruments and batteries by the measure of their resistance expressed in B. A. units; and of batteries by their voltametric and magnetic powers expressed in absolute units.

I believe there is no school in the world where an education in Telegraph Engineering is obtainable. The Science College of Chester, England, and one other Institute are recognized by the Secretary of State for India, as proper schools for applicants as assistant superintendents of the Indian Telegraph lines, but their course does not include Telegraph Engineering proper, but only the concomitant sciences, such as Chemistry, Electricity, Mathematics, etc., and the Engineering must be gained by an apprenticeship under a recognized Telegraph Engineer. What do you think of the matter?

I should be willing to start with half-a-dozen pupils, or even less, because I am convinced that after the first class graduates, Operators and the Companies will become convinced of the vast benefit of knowing something more than manipulation, which can, and is being better done by mechanism, than by the hand.

Very respectfully,

WM. T. SCHEIDE,  
Civil Engineer.

It gives us sincere pleasure to publish Mr. Scheide's letter, which, though not designed for publication, we use to show that there is a future for the profession in which operators shall perform much more than now, an intelligent part. We regard Mr. Scheide's letter as one of the encouraging signs of the times and trust that his example may stimulate others in a like direction. We also hope that the Telegraph Companies may come so to appreciate such a course of education as to encourage it by every means in their power, and give facilities for its attainment.

The writer of the above has since notified us of the postponement of his enterprise.

A physician of Breslau announces to the Academy of Sciences in Paris, that he has succeeded in illuminating the cavities of the living human body by means of electricity, so as to render their interior visible to the physician.

### The Page Patent.

We give on our first page articles from the *N. Y. Herald* and the *Scientific American* on the Page Patent, of which so much has recently been said. Neither of these articles touch the question in dispute, except that it is a most strange procedure on the part of the Government to order a patent issued to an expert, however worthy, who has, as the Government's own agent, granted innumerable patents to other parties in which the same idea was involved. Concerning the hammer in the Runkhorkoff coil, telegraph companies care nothing; one of the claims connected with this would place, however, all electro-magnetic machines—the “shocking” instruments so much used by electropathists and others under control of the patentee. The item affecting telegraph companies is that in which claim is made for the alternate action of the magnet and spring which, in 1837, Prof. Page claims to have created by means of a weight, the equivalent of a spring, which released the armature on the arrest of the current.

On this subject we have various interesting articles written by men whose contrivances are imperilled by this extraordinary grant, but which have been delayed so long by the crowded condition of our columns as to make them comparatively untimely. We hope ere long to learn from the best authorities the whole condition of this startling claim, which we cannot believe will be allowed, under any circumstances, greatly to embarrass the owners of devices in which the principle claimed is employed. We do not believe a single dollar therefor will be collected.

### Sunnyside.

The following circular from Porter's Telegraph College, Chicago, gives a very rosy side to the life of a Telegraph Operator. Who would not be a Telegrapher?

Enterprising young men can obtain a good salary in a shorter space of time than in most any other business. The salaries of operators on commercial lines range from sixty to one hundred and twenty-five dollars per month. Students have graduated directly into positions paying as high as one hundred dollars per month. From three to four months spent in the telegraph college will enable young men of ability to manage a telegraph office. The telegrapher may select his place of business and residence in accordance with his fancy, either in the great metropolis, the quiet village, the fashionable watering-place, or the isolated cabin on the plains. In many instances the telegraph is connected with other business, and thus advantages of great value are secured. Some operators do a thriving business in this way. Railway companies, express companies and manufacturers offer a premium, by way of large salaries, for the services of telegraphers, to act as agents, bookkeepers, or to fill other responsible positions. Telegraph operators not unfrequently have the opportunity afforded them of traveling to distant parts of the country. The principal of this institution has rejected invitations of visiting Russia, Cuba, Salt Lake City, San Francisco and other distant points. In addition to being in advance of the printer in the reception of the latest news, telegraphers enjoy the privileges of railroads, steamboats, express, and not unfrequently of hotel living and public entertainments. The study and practice of telegraphy is not tedious, but, on the contrary, to those having leisure hours, it would serve as a pastime rather than as a task.

### In Congress—Security of Despatches.

Mr. Eldridge, offered a proposition declaring that the seizure of private and personal telegrams was violative of the Constitution, which provides for the right of the people to be secure in their persons, houses, papers, and effects against unreasonable searches and seizures, and that no warrants shall issue but upon a probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized, that such seizure is an outrage upon personal liberty to which no free people can tolerate or submit.

Mr. Eldridge moved to suspend the rules, which was disagreed to, and so the resolution went over until next Monday.

### Odd to Spring.

The following gem from John Phoenix, upbraiding a backward spring, has peculiar point to the year 1868:

Well, Spring, youv cum at last, hev you?  
The polt sez youv bin a sittin in Old Winter's  
Lap—now aint you ashamed of yourself?  
I spose the old feller's bin a busin you;  
I should think he had from your breth  
A bein so cold—but that's the way them  
Old feller's hev a doin.

Well, as I was sayin,  
Youv cum at last with your “bamy  
Breth” a blowin from the Northw—  
Wesconstant or Nebraska, I spose,  
Great countries for bam I reckon.

Now youv cum wen  
Everybod's feed and Korn and things  
Hev all bin fed out! Now luck at  
Our Kritters, will ye? See our Kat!  
On the lift, a hev in to be steaded by  
Thur tales when they gits up a mornings!  
Luk at our hosses wat's all rejoned  
To skeletons a weepin over a troff;  
A hull troff full of kobs!  
A hull troff full of bitter rekleckshuns!

Luk at them shepe allen in  
The fence corners a waitin for grass!  
Yis! and they've bin a waitin some ov  
Them weex! And if they wasn't  
Puld theyd a bin “shakin their lox  
At yu an sed—U dun it!” (That thur  
Is from Hamlet, won of Shakespepur's plais.)  
As another polt sez—“Grass refused makes  
The stumak ake.” So these shepe will  
Never open thur i onto grass agin—no.

Now luk at them hogs as has bin  
A follerin them katel wat hev bin  
Stuff with ha! See em, will ye, a creepin  
Round as if theyse tetchd with korns.  
Luk at thur eyes, will ye—bigger nor  
Enny cabbitch lefe!

See the shotes  
A lenin on the fens to squele!  
Luk at them mity eres “a hangin pendint”  
Onto such little hogs! See a hundrid  
Gud shotes rejoned down to a even  
Korn basket full!  
Yes, that thurs ov yer doins, U  
Tardi, lolterin Spring!—a hangin back  
As youv bin a doin,

But now youv cum!  
We feel your cheerin presenz when we  
Glt round onto the south side ov the barn!  
We heer the hens a kaklin when they've  
Laid an egg! We see the horse-radish  
A startin up along side the garding  
Fens! The wimmin is a lukin into  
The old teapot after garding seeds,  
And all these things make me think youv cum!

Ef so be I've riled  
Ye Spring, a showin up ov yer short cummings  
Jest set it down to havin polts lisen,  
(Tho I haint taken one out, yet I 'low to.)

### The Telegraph Project Abandoned—Postal Matters.

The House Postal Committee to-day (June 5) had up Mr. Washburn's bill to build a Government line of telegraph between Washington and New York. The Committee agreed, by a unanimous vote, to report it adversely. They regard all schemes to draw the Government into any such business as utterly impracticable. The Committee will report in favor of changing the postal money order system, so that orders will be issued for any amount from \$1 to \$50, for the first \$20 a fee of 10 cents; from \$20 to \$30, 15 cents; \$30 to \$40, 20 cents; \$40 to \$50, 25 cents. Also, a provision to allow weekly newspapers to be deposited in the post-office nearest to the office of publication, and delivered free of postage to regular subscribers at the office, but not to be served by carriers. Also a provision to return all letters to writers free of postage, when any card or address is upon the outside of the letter, and when such letters are not called for within 30 days.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, JUNE 15, 1868.

## THE SABBATH.

To the President and Directors of the telegraph Companies of America.

We, your employees, respectfully call your attention to the fact that the communications sent over the wires upon Sunday are, in the majority of cases, of a commercial nature, and that this profanation of the sacred day of rest by business men is steadily increasing, and we desire to offer our united protest against the consequent infringement upon the world-wide privilege of one day's rest, which this business is more and more entailing upon us.

The morality and refinement of the nineteenth century protest against all labor upon the Sabbath, which is not strictly that of necessity or mercy, and we cannot but feel confident that when the subject is brought to your consideration, you will readily appreciate the justice of allowing us the privilege, enjoyed by yourselves, of engaging in the devotions of the Sabbath, and, in the quiet of home circles, renewing our energies for the duties of the coming week.

We are aware that there are men in your employ who are willing to break the Divine Commandment, and work upon the Sabbath for pay. With such men we do not sympathize. We wish no *premium* offered us as a temptation to do wrong. We take our stand upon a rock, a firm foundation, the *Command of Almighty God*, who is rightfully our Lawgiver and our Judge, and His command is equally binding upon the rich and the poor, the employer and the employed.

If the subject is looked upon from a *financial* point of view, we claim that you are losers, and not gainers, by imposing this work upon us. The business which is now done upon the Sabbath would be deferred until the following day, but it would not be lost to you; while you cannot reasonably expect your employees to be faithful in the discharge of their duties, and to consult the interests of their employers, if they are forced, perhaps by threats of discharge if they refuse to do that which is against their consciences and against all principles of right and of justice.

We, therefore, one and all, Telegraph Employees from Canada to Mexico, from Newfoundland to California, do hereby earnestly and respectfully request that you will cause to be discontinued the practice of opening your respective offices upon the Sabbath, excepting in cases of absolute necessity or of sudden emergency.

Your compliance with this request will be gratefully received by us all, and cannot fail to inspire in our hearts sentiments of great respect for our employers, and renewed devotions to their interests.

THE call above is respectful, and deserves, as it will no doubt receive, careful attention. We regard, however, the reference to those engaged on necessary Sabbath labor as a blemish to the petition, and

uncalled for. The assertion of the right to the Sabbath, needed no expression of personal virtue. Yet this is a matter of taste at which we do not wish to cavil.

The Sabbath is, in its origin, a Divine institution. It was instituted for rest. Its design was like sleep, to arrest the wear of toil, and render existence healthful and joyous. Its necessity has been attested by the civilized world. It has thus a double claim, man's wants demanding what God's wisdom has ordained. Many men want say this because it sounds religious. Yet all enjoy it and would not alter the civil law which recognizes it if they could.

While we acknowledge all this, and have made ourself obnoxious in its assertion, we recognize in the telegraph an agent of mercy, affording the medium of that mitigation of suffering and relief from anxiety which, to some extent, opens to its use even the hours of the day of rest. There seems a necessity for opening the offices on the Sabbath for a period long enough to enable the communication of despatches of the kind indicated to be made. That period should be brief as possible. Inasmuch as the usual facilities for travel are stopped on the Sabbath, and despatches of a social character largely relate to circumstances requiring a speedy presence, the opening of offices may be properly limited to those regulating the Post office, and would meet every ordinary necessity.

There is a service, however, now created by the extension of the wires nearly round the globe, which, by the variation of time and delay in transmission, must encroach more or less on the Sabbath rest. The files of Saturday must be cleared and transmission made complete. We hope this may not grow to any serious destruction of the day's designs, and trust the Companies, while they seek to meet public wants on the one hand, will on the other, determine to place every possible guard around an institution which has so much to do with the happiness of our homes, and the public welfare.

### Return of Professor Morse.

We gladly welcome back again to his native land the world-renowned, the genial and gentle gentleman who calls us his children, and whom, on that account, we should call father. Professor Morse is old enough, it is true, to bear a more patriarchal name, for he is now in his seventy-eighth year, having been born at Charleston, Mass., April 27, 1791. But, except that mass of flowing snowy hair and venerable beard, there seems no signs of the decrepitude which is supposed to follow the allotted threescore years and ten of human life. His head is as erect, his eye as clear, his step as brisk as if at the meridian, and there seems that elasticity and succulence about him which would lead one to expect of him to crown a century with the lustre of his name, graduating perhaps to be considered grandfather, and surrounded by a million operators to whom his name will even then be associated with the simplest and most successful instrument of any age.

Mr. Morse's sojourn in Europe during the past two years has been a constant ovation. Everywhere he has been received with the most distinguished honor. Everywhere is his instrument recognized as meeting the popular necessities for communication from its simplicity, cheapness, and capacity. Never before was an inventor so completely victor. The refinement of his manners, the kindness of his heart, the purity of his tastes, the genial Christianity which distinguish Mr. Morse's Life, give an enviable radiance to his well earned fame.

Prof. Morse sent us from Paris a copy of a partial vindication of himself against errors in telegraphic histories which have done him injustice, and which he designs making much more voluminous. Our columns have been too crowded to use the facts thus acquired, although we have them in store for that

purpose. Mr. Morse's reputation can afford delay. The world has given him, by common consent, all he claims. He can afford to let pass the detractions of the envious, although it is his duty to correct history. We shall do our full duty in aiding him so to do. We write this merely to say—WELCOME HOME.

## GREAT BRITAIN.

The Atlantic Telegraph Company.

LONDON, June 12.—The Directors of the Atlantic Telegraph Company have this day declared a dividend, payable on the first day of July, of six per cent. on their preference stock and three per cent. on their original stock.

WESTERN UNION TELEGRAPH CO.,  
TREASURER'S OFFICE, 145 Broadway, N. Y.,  
June 10, 1868.

### DIVIDEND No. 25.

The Board of Directors have this day declared a dividend of two per cent. on the capital stock of this Company, from the earnings for the six months ending June 30, instant, payable at the office of the Treasurer, on and after July 20, 1868, to the owners of the said stock as shown by the books of the Company, at the close of business on the 20th (June) instant. The transfer books will be closed on the 20th instant, and opened on the morning of the 21st of July, proximo.

O. H. PALMER,  
Treasurer.

Superintendent E. D. L. Sweet.

We regret more than we can well express in an article like this to learn of the resignation of the worthy gentleman whose name heads this announcement. We are sure that the knowledge of it will cause equal regret wherever Mr. Sweet is known, and especially by the men connected with that large section of telegraphic territory over which he has had so long the chief direction. It is a loss of a man whose integrity of character, whose kindness of heart, whose skill in management, whose resources of both head and heart rendered him peculiarly valuable to the Company he served, and which commanded from them their confidence and esteem.

The sphere into which Mr. Sweet now enters indicates the reason for his resignation. As a Christian man he prefers more direct identification with the great religious enterprise under the auspices of the young men of Chicago, which, in its present condition, requires the best executive skill, and that measure of integrity and tone of character which will unite the public of Chicago in its progress and success. The Young Men's Christian Association of that city, whose buildings were recently destroyed by fire, are now engaged in their re-erection on a more extensive scale, and with a wider purpose of beneficence to the people. They have selected Mr. Sweet to conduct the enterprise, and have elected him, we believe, President of their organization. This selection is the best proof of the soundness of the work and the beneficence of its character, which, in his hands, will be conducted with prudence, with quiet but unflinching zeal, and with scrupulous conscientiousness. This will secure its success.

While, therefore, we utter our heartfelt regret that a Company which needs just such men to carry out its work loses one so worthy of their confidence, and that his companions in what we regard as one of the great labors of the age are no longer to have him associated with them except in the kindest remembrances, we bid him God speed in his new duties, trust that long life and much usefulness is in store for him, and assure him that the hands which have ever been his in past labors will be his wherever in the future he may be.

**A Telegrapher Turned Governor.**

We had the pleasure a few days ago of taking by the hand, his excellency Governor Bullock, of Georgia, who, not many years ago, was one of our telegraphic fraternity, doing good steady service at one of the original House printing machines. Young, rotund, and massive, with a flowing beard, and an eye full of the *bonhomie* of a contented mind, and a generous nature, our old companion in labor is every inch a governor, without being lost to his old friends amid the dignities of his office. We hope he will be able to unite the elements of Georgian society by a wise, just, and careful administration. It is a grand opportunity to serve the country and cement society into peace. Governor Bullock was one of two of our number, who, during the spring canvass were candidates for gubernatorial honors. Marshall Jewell, of Hartford, Conn., failed to be elected although supported by his party with enthusiasm, and every way worthy of the honor designed for him.

THE annual meeting of the stockholders of the Western Union Telegraph Company will be held at the Executive Office of the Company (145 Broadway) on the second Wednesday (8th) of July, 1868, at noon of that day.

Charles T. and J. N. Chester.

Nothing is more surprising than the large force constantly at work in the manufacture of telegraphic machinery. Notwithstanding the Western Union Telegraph Company has large facilities of its own, hundreds of men are engaged elsewhere turning out in large numbers the different appliances of the telegraph. We confess to a feeling of surprise in finding at the establishment of Charles T. and J. N. Chester, on a casual visit there a few days ago, forty skillful men all engaged on the construction of telegraphic machinery. Much of the work done by the Chesters is on machinery the product of their own skill, Mr. Charles T. Chester being one of our finest electricians and practical mechanics. Like the firm of Tillotson & Co., this house has a national reputation, and is known for the beauty of its workmanship, and the high character of the brothers who compose the firm. The firm of Partrick Chester & Co., of Philadelphia, is a co-operative branch, and has a large and increasing trade.

**The Brooks' Insulator.**

An English test of this insulator is crowded out of our columns this week, but will be given in our next. It gives the startling result in comparison with Mr. Varley's double porcelain cup, of two degrees deflection with the Brooks' insulator to 4,500 of Varley's, in another test of 2 to 37,500, and in a third of 4 Brooks to 50,000 Varley. These are evidences of extraordinary perfection, and in every step to attain which we congratulate inventors. A recognized standard insulator is a great want. The above tests were made by Mathew Gray, Engineer and Manager Gutta Percha Works, Silvertown, Essex, England. W. R. Allison, Esq., 22 South 21st Street, Philadelphia, is the maker and proprietor of the Brooks' insulator.

We find we have to surrender our claim to having made the first appointment of a lady operator, in favor of our dear departed friend, James Eddy, formerly Superintendent of the American Telegraph Co., one of the best men to whom authority was ever given. In the fall of 1850, he appointed Miss Emma F. Livermore, operator at Augusta, Maine, a few months before the appointment of Miss Emma Hunter, at Westchester, Pa. Both of these ladies are skillful operators, though not now under appointment as such. Mr. D. P. Livermore is manager at Hallowell, Maine, and finds it very convenient to occasionally delegate his duties to his intelligent and skillful daughter.

**For Tariff Circular, see Page 6.****Gillespie's Self-closing Key.**

We have received from Mr. A. J. Gillespie formerly of Ashley, Illinois, and now of Ottumwa, Iowa, a specimen of a self-closing key, an illustration of which will be found on our first page. The arrangement is very simple and a great improvement on the one first sent us, to which we called attention in a former number. The inventor says:

"Any one who holds the finger plate in any shape cannot fail to operate with this successfully, as it gives a solid finger plate same as any other when in use. All the difference is you cannot pound it, but can write with it in any other manner. After the plate is pressed together, a finger held on one side or in front is all that is necessary to keep it in position.

"The way to open the key is to first press the plate *downward* with the fore finger, then hold it in any desirable manner. It is also provided with a thumb screw for the purpose of regulating the strength of the spring, and also, if for any cause (which is sometimes the case) it is desirable to leave the key open. Also, in sending a Press report or any very long message where it may be desirable to pound the key, a turn of the screw changes it to operate same as any other key, but the screw must be turned back again when done."

The description of the key is simple. The hammer *h*, which, as will be seen, is a movable pin, is held down when at rest by a stout short spring *f*, closing the circuit. When in use, the upper finger plate, which, as will be seen is in two parts, when pressed down by acting upon a lever *c* pivoted at *d*, releases the spring *f*; the hammer *h* is lifted from contact with the anvil by the spring *s* and the circuit opened. While operating, the finger plates are kept together by the thumb and finger, although with care the key may be worked by the simple regular pressure of the finger on the upper plate.

ANOTHER.

Here comes a model of yet another self-closer from our genial-faced friend, S. C. Jones, of Albany, which has given us and others the occasion of a good hearty laugh. This key is of the Western Union style, with a lever pivoted on the side of the arm a little back of the anvil, having its short end touching the upper brass plate which ordinarily receives the circuit closer, and the long end standing upward and backward, about two inches above. In this contact it is kept by a spring affixed to the long arm and attached to the key arm behind. To the upper extreme end of the arm a string is attached terminating in a ring large enough to receive easily the third finger, and which is short enough when so placed to draw forward the lever when the index and second fingers are on the finger plate, thus opening the circuit. The feeling of the check-rein apparatus is rather pleasant. It makes one feel like driving a small pony, and when manipulating with it, one almost instinctively says, hey! get along! especially as the ring Jones sends us is evidently taken from some horse gear, and the reins are of red string. So don't despair boys; you are sure of a self-closer by and bye.

Mr. Jones says he made his own key. We are even with him, for we made our own cut. It is our first attempt.

**A Great Want Supplied.****BISHOP'S CENTRAL TELEGRAPH DEPOT.**

We commend Mr. Bishop and his very liberal enterprise. Both inventors and manufacturers can have complete confidence in his honor and liberality. We endorse him cordially.

**BISHOP'S TELEGRAPH ROOMS,**

113 LIBERTY STREET, NEW YORK.

TO MANUFACTURERS OF TELEGRAPH AND ELECTRIC INSTRUMENTS AND APPARATUS:

I have opened Rooms in the building now occupied by the BISHOP GUTTA-PERCHA COMPANY, No. 113 Liberty street, N. Y. City, for the Reception and Exhibition of every kind of

**TELEGRAPH AND ELECTRIC APPARATUS,**

to be kept open Every Day, and properly attended to, and the articles on exhibition taken care of by me.

I invite you to send me any articles of your manufacture, properly labeled, with your name.

The charge for space and care of Instruments, etc., will be ten per cent. of your saleable price, for the year.

Insurance, if required, will be charged extra.

Exhibitors will at all times be admitted to the Rooms with their customers to show samples, and sell from them, free of charge.

N. B.—Battery power will be supplied for testing, etc.

Respectfully,

SAMUEL C. BISHOP.

New York, May 30, 1868.

**OFFICE OF THE**

BISHOP GUTTA PERCHA COMPANY,

113 LIBERTY STREET,

SAMUEL C. BISHOP, General Agent.

INSULATED POLE LINE CORDAGE

AND

OUTSIDE OFFICE CONNECTING WIRES.

We have completed some valuable Experiments, and have now the pleasure to offer to Telegraph Companies, and others interested,

THE BEST

AIR LINE

AND

OUTSIDE OFFICE INSULATED WIRES

that can be had

Parties using are invited to examine them at our Office.

SAMUEL C. BISHOP,

May 30, 1868.

General Agent.

**STICKWELL & CO'S**

EXTRA MUCILAGE

THICK, CLEAR AND ADHESIVE

Who has not used

STICKWELL'S MUCILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the Parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding or any other man. It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOURS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, 8OZ. CONE, 8OZ. FLAT, 3OZ. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES

S. S. STAFFORD,

Sole Proprietor, N. Y.

**S. S. STAFFORD'S**

COMBINED

WRITING AND COPYING FLUID,

Labelled by me, for the last ten (10) years, ARNOLD'S FLUID Superior to any Fluid used. It is Greenish Blue in color, turning Jet Black, flows freely, dries rapidly, does not set-off in books, gives one or more excellent copies. Has no sediment, can be used to the last drop. It is 33 1/3 per cent. cheaper than any other (so called) combined ink. Used exclusively by the Western Union Telegraph Company.

For sale by all Stationers and Druggists, and at No. 11 Cedar street, New York.

S. S. STAFFORD,  
Chemist, N. Y.

## TARIFF BUREAU.

## Semi-Monthly Circular.

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
June 15, 1898.

## To all Offices on W. U. Lines—

The following changes have occurred since June 1st, the date of the last Tariff Order. Please note them in your Tariff Book:

## NEW OFFICES.

Coalport, N. J., tariff same as Bordentown, check Bordentown.  
Berkely Springs, W. Va. (re-opened), tariff same as heretofore, or 15 more than Sir John's Run.  
Big Thompson, Col., tariff same as Laporte, Col.  
Dresden, O., tariff same as Newark, O.  
Edwardsville, Ill., " " Bunker Hill, Ill.  
Edwardsville Crossing, Ill., tariff same as Bunker Hill, Ill.  
Georgetown, Col., tariff 50 and 3 more than Central City, Col.  
Laramie City, Dakota, tariff same as Fort Sanders, Dakota.  
Living Springs, Col., (re-opened), tariff same as heretofore.  
Liverpool, Pa., (re-opened), tariff same as heretofore, or 30 and 3 more than to Harrisburgh.  
Monument Sta., Ks., Tariff same as Cayotte, Ks.  
Palestine, Ind., " " Indianapolis, Ind.  
Slatington, Lehigh Co., Pa., (re-opened), tariff same as heretofore, or same as Catawqua, Pa.  
The following summer offices have been re-opened:  
Caldwell (Lake George), N. Y., tariff same as heretofore.  
Churchville, N. Y., tariff same as Batavia, N. Y.  
Cornwall, N. Y., tariff same as heretofore.  
Cozen's Hotel, West Point, N. Y., tariff same as heretofore.  
Lake Mahopac, N. Y., tariff same as heretofore.  
Trenton Falls, N. Y., tariff same as Booneville.

## OFFICES OPENED ON OTHER LINES.

Plank Road, Ill., 25 and 2 from Chicago, check Chicago.  
Mount Vernon, Iowa, 85 and 4 from " "  
Pueblo, Col., 150 and 10 from Denver, Col., check Denver.

## OFFICES CLOSED.

Cayotte, Ks., Fort Morgan, Col., Fort Sanders, Col., Elizabethtown, Ind., and Barton, Md. Business for Elizabethtown, Ind., will hereafter be mailed at and checked against Columbus, Ind. The following offices have been closed temporarily—Dorttown, Greensboro and Tebeauville, Ga., and Lake, Miss.  
On and after June 15th the tariff to the following offices on the Philadelphia and Reading R. R. Telegraph Line will be 35 and 3 from Philadelphia or Harrisburgh.  
Offices whose tariff to Harrisburgh is less than to Philadelphia will check Harrisburgh on business to these points. All other offices will check Philadelphia.

Aramingo,	Myerstown,

Minersville,	Sinking Spring,
Middleport,	Swatara,
M. H. Crossing,	Tamaqua,
Mohrsville,	Tremont,
Monocacy,	

The above named offices are all in Pennsylvania.

## GENERAL INFORMATION.

The name of the office heretofore known as Middletown, Ill., has been changed to Inka, Ill. Penataguit, L. I., has been changed to Bay Shore, and Brown's Track, N. Y., to Moose River. Tariff to the latter 15 cents more than to Port Leyden, N. Y. The post office address of Bulls Island, N. J., is Raven Rock.

In the last Journal the notice respecting business for Allentown Junction should read as follows: All commercial business sent to and received from Allentown Junction, Pa., should be checked against Allentown. For Blainville Intersection and Blainville, read Blainville Intersection and Blainville; for Catesville read Coatesville, and for Derby read Derry.

WILLIAM ORTON,  
President.

TRACK laying, which was suspended on the Kansas City branch of the Union Pacific Railroad, during the winter, is again resumed. On the first of June the cars were running to Fort Wallace, three hundred and eighty-five miles west of Kansas city.

## Philadelphia City Delivery.

All telegrams to points within 1,000 numbers, or ten blocks of the main office, (No. 250 Chestnut street and 101 and 103 South Third street), delivered free.

A pamphlet of 96 pages, entitled "The Resources of Missouri," by Sylvester Waterhouse, has been placed in our hands. It is, as its title indicates, an exposition of the resources of a State so situated geographically both in relation to other States, to our great rivers, and to climate, and with a soil of so rare richness, as to predicate for its future a career of greatness and power not excelled by any of its sister States. What Missouri needs is men. "Her present industrial force is not equal to the developments of her resources. She seeks the co-operation of the self-reliant laborers of New England, and of the 200,000 sturdy immigrants who are annually landing at the port of New York. Millions may accept the proffered hospitalities, without exhausting the ample board which Missouri spreads upon her tablelands."

## AN INTERESTING ELECTRICAL EXPERIMENT.—

M. Becquerel, in making some researches into the subject of the dialysis of the electrical currents, lately found that in passing discharges from an induction coil, between the upper surface of a saline solution, contained in a glass tube, and the extremity of a platinum wire fixed at a short distance, the spark was surrounded with a cloud colored, according to the sort of salt used in the experiment.

WANTED—SITUATION BY A FIRST-CLASS SOUND Operator. Has had 5 years experience. Best of reference furnished. Apply to

**Telegraphers'****Mutual Life Insurance Association.**

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

D. R. DOWNER, Secretary.

J. D. REID, Treasurer.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

**DIRECTIONS TO APPLICANTS.**

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

OREIDE METAL,

which is much richer and finer than brass, he now presents his  
work in a style and of a quality that are unsurpassed.  
His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their  
superiority is generally acknowledged by operators who use them.  
Aside from the advantages apparent upon inspection of these  
magnets, their acknowledged merits consist in the construction of  
the helix, which was patented August 15, 1865. This being of naked  
copper wire, so wound that the convolutions are separated from  
each other by a regular and uniform space of the 1-800th of  
an inch, the layers separated by thin paper. In helices of  
silk insulated wire the space occupied by the silk is the 1-150th to  
the 1-300th of an inch; therefore a spool made of a given length and  
size of naked wire will be smaller and will contain many more con-  
volutions around the core than one of silk insulated wire, and will  
make a proportionably stronger magnet, while the resistance will  
be the same.

PRICES.

Relays with helices in bone rubber cylinders, very fine	\$19 50
Small Box Relays	16 00
Same in Rosewood	17 00
Medium Box Relays	17 00
Same in Rosewood	18 00
Large Box Relays	18 00
Main Sounders same as the above, with heavy arma- ture lever, without local connections	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys	22 00
Excellent Repeaters	40 00
Pony Sounders	6 75
Keys	4 50 to 6 50

All other appliances made to order. Extras pools for replacing  
such as may be spoiled by lightning, furnished at \$1.25 each. Old  
spools taken at the price of new wire by the pound. Goods sent to  
all parts of the continent with bill C. O. D. Or, to save expense of  
returning funds by express, remittance may be made in advance by  
certified check payable in New York, or Post-office orders, in which  
case we will make no charge for postage.

He has ample facilities for furnishing all other kinds of Tele-  
graph Supplies at the lowest manufacturers' prices.

CHARLES W. BOTELER.

ALEXANDER HOLLAND, *President*.  
NICHOLAS MICKLES, *Vice-President*.

GEO. CONANT, *Secretary*.  
GEORGE ELLIS, *Treasurer*.

The East India Telegraph Company is incorporated under a special charter granted by the Legislature of the State of New York, to construct and operate telegraphic lines in the Chinese Empire.

The Chinese Government has granted, through the Hon. Anson Burlingame, late U. S. Minister at the Court of Peking, permission to the Company to connect the great seaports from Canton to Tientsin, the port of Peking, by submarine cables. The initial enterprise, and to which the Company now propose to bend its energies, is to lay these nine hundred miles of cable, to be followed in due time by the continuation of the line to Peking, and the building of other lines in the interior of the country.

It is proposed to construct this first line at once, to connect the following great seaports, along a coast line of about nine hundred miles:

Canton having a population of 1,000,000.	
Thence to Macao, having a population of 60,000, a distance of 70 m.	
" Hong Kong, " " 250,000, " 75 "	
" Swatow, " " 200,000, " 130 "	
" Amoy, " " 250,000, " 115 "	
" Foo-Chow, " " 1,250,000, " 120 "	
" Wau-Chu, " " 300,000, " 120 "	
" Ningpo, " " 400,000, " 125 "	
" Hangtchean, " " 1,200,000, " 60 "	
" Shanghai, " " 1,000,000, " 80 "	
	5,910,000 895 m.

These are the principal Chinese ports now open to foreigners, and their foreign commerce alone amounts in value to \$900,000,000. But that trade, enormous and important as it is, is of far less consequence to a telegraphic line connecting these great seaports, than the fact that from these ports the immense internal commerce of the whole empire spreads through its vast system of multitudinous canals and navigable rivers. The domestic trade of the 6,000,000 of people in these cities alone is enormous, and their aggregate foreign and domestic commerce—undoubtedly larger than that of the United States—must necessarily avail itself immediately of the facilities of telegraphing the moment a line is established. There is no postal system in China, and correspondence has to be carried on by special messengers where the importance of business justifies so expensive a method, by the irresponsible medium of transient vessels, or the regular foreign steam packets. A new channel of intercourse, speedy, certain, and trustworthy, must absorb, there as everywhere else, the despatches of Government, of commerce, and of social life.

## The Meteorograph.

Among the scientific instruments on exhibition at the Paris Exposition, none attracted more attention than the "meteorograph," an invention of the celebrated Italian astronomer, Father Secchi. This wonderful instrument records, automatically, the time of day, the changes in the temperature, pressure, moisture and motion of the atmosphere, etc. The distinguished inventor was in Paris, and passed the most of his time at the Exhibition, carefully noticing and studying everything new and valuable. The instrument of which he is the inventor moves by clock-work, and marks down upon a long strip of paper, which is unrolled at one end and rolled up at the other, the time of day, the changes in temperature, the direction and intensity of the wind, the height of the barometer, the hygrometric state of the atmosphere, and the quantity of rain which may have fallen within a given time. All this is effected by a pencil for each separate work, kept constantly in motion, and moved by nicely-adjusted machinery, which performs its task with unerring certainty and fidelity. The diagrams made by this instrument, as well as the instrument itself, were objects of great interest among the scientific as well as curious portion of the visitors.

## Testing Wrought Iron by Magnetism.

When a wrought iron bar is placed in the magnetic equator, that is in a direction at right angles to that of the magnetic north and south, it becomes temporarily magnetic, one side having a north, the other a south polarity. If now a magnetic needle be placed in front of the bar and moved along parallel with the latter, it will not be disturbed in pointing due north and south as long as the iron of the bar is homogenous; but whenever there is the slightest flaw its polarity will be affected and it will deviate from a proper direction opposite the affected part. Repeated experiments have been made with bars supposed to be homogenous, and examination at the point of disturbance always revealed a defect. A small pin of steel inserted longitudinally in a four-inch wrought iron bar and welded up, was accurately indicated by the needle.

## Process for Covering Iron or Steel with Copper without a Battery.

This process, due to Herr Graeger, is described in a recent number of the *Polytechnisches Notizblatt*. The objects are first well cleaned, and then painted over with a solution of protochloride of tin, and immediately afterward with an ammoniacal solution of sulphate of copper. The layer of copper thus produced adheres so firmly to the iron or steel, that the different objects can be rubbed and polished with fine chalk without injuring the deposit. The tin solution is prepared with 1 part of crystallized chloride of tin, 2 parts of water, and 2 parts of hydrochloric acid. The copper solution, with 1 part sulphate of copper, 16 parts of water, ammonia sufficient to re-dissolve the precipitate formed when it is added. Zinc and galvanized iron can be treated, according to Boettger, directly by the copper solution, without using the tin salt.

## West Point—The Telegraph Drill.

Correspondence of the N. Y. Tribune.

West Point, June 30, 1868.

Perhaps the most interesting feature of the exhibition at the Military Academy was the telegraph drill to-day, interesting from the fact that it was the first practical drill of the new system, and officers and visitors were alike astonished at the rapidity with which a telegraph line could be established, ready for the transmission of messages. To Gen. Grant, Pitcher, and Schriver the nation is indebted for introducing a branch of study at the Academy, the want of the actual execution of which was often experienced by those Generals during the late war, and to Gen. Meyer belongs the honor of having arranged and perfected that system until now one mile of wire can be laid, with apparatus attached and ready for work, in seven minutes. The cadets are instructed, not only in all the duties of locating the lines, but in the attaching of instruments and the transmission of messages. Passing slowly along the road in review is the Flying Telegraph Train. First came the wire wagon. In the rear of this vehicle, on an adjustable stanchion, is a reel of wire with a crank to wind the wire when the line is taken up, extra reels of wire, insulated wire to be used when rivers are to be crossed, naked wire for ordinary uses, and the "sounder." The cadets are so thoroughly trained in this branch that they can both receive and transmit messages by sound. In this wagon is also a patent reel made to fit on the back of a horse in case a point is reached where it is impossible to go on in the wagon. Followed by the lance wagon in which are placed the poles for the wire, crowbars, a tool-chest, pins, nails, and ladders, so if necessary to have the line run through dense woods, the wire can be fastened to the limb of a tree. Followed by the telegraph station also on wheels containing the batteries so arranged to be almost impossible to be broken, a very ingenious contrivance made by the firm of Charles T. & J. N. Chester of New York. The improvements made in military telegraphy by this firm have received warm comments from military officers and the insulator for naked wire is admitted by foreign offices to be the finest in the world; and I would here state this fact gratifying to every American, that officers from other nations are now in this country, for the purpose of learning our military telegraphic and signal system. The batteries run along the side of the wagon, and can be easily removed and with the instruments carried into a house, and have only to be supplied once a fortnight. In this wagon are desks, stools, and all the appliances for four telegraph lines. These three wagons constitute a Flying Telegraph train. After passing in review the wagons halted near the barracks, about three quarters of a mile from the hotel. The signal was given and the drill began. First came on the double quick a non-commissioned officer bearing a flag and marking off the points with a pin where the poles or lances are to be set. Next followed the wire wagon also on the run, reeling out the wire, next the lance wagon on the double quick, the men inside throwing out a lance at every pin, and a squad of men with crow

bars made holes in the ground, taking up the pin, setting the lance and laying the wire. Then followed the station wagon with instruments set, and in seven minutes three-quarters of a mile was ready, and a message was passing over the wire, and an answer received from headquarters. A station was opened at Fort Putnam, on the hill, within sight of the hotel, and a signal officer was sent up with a flag. Now the two systems were combined, a message was sent to the fort with instructions to answer by the flag, and in a few seconds the waving flag spelt out the answering words. The great importance of the signal system to the united service cannot be too highly appreciated when land and naval forces unite in attack or defense. One of the most interesting features of the presence of the fleet is the conversation carried on by signals between the middies on board and the cadets on shore. The movements of a train can be likened, in some respects, to those of light artillery, and lines can be ordered to any point and stations established with as much ease and certainty as a gun can be ordered to any position. The average rate of speed in building a telegraph line, putting it up and setting it at work, when without emergency, is one hour to three miles of line. The drill yesterday was to exhibit the working with the greatest possible speed. The men attached to the field electric telegraph, or the flying telegraph train, are drilled with as much precision as soldiers in any other branch of the service. It is the object of the train organization to be able to erect lines and establish stations rapidly along roads on which the army is moving, or to run out lines and make communications anywhere between forces actually engaged upon the field—to be able, in fact, to send orders by electricity almost as soon as issued by the Commander-in-chief, instead of mounted couriers to be lost in the woods or aids galloping under the enemy's fire. After testing the telegraph to the satisfaction of all—the ladies sending messages to the barracks and the fleet—the order was given to take down the line. This movement was also executed on the double quick, and in a few moments the wagons, with the wire reeled up and the lances in the wagon, passed slowly along the road to quarters, and no trace remained of the military telegraph line.

### Correspondence.

#### Another Atlantic Cable.

Correspondence of the N. Y. World.

PARIS, June 5.

The efforts of Mr. George Law, of New York, backed by the original French Company, under Eugene Delessert, have finally resulted in obtaining an official document from the Minister of the Interior which will enable the company to carry out their intentions of laying a transatlantic cable between Brest and New York. In April, 1867, an act was passed by the Legislature of the State of New York, at Albany, granting to C. C. Leigh, and others, the exclusive right to lay cables between France and New York for the term of twenty years. The French Government has decided to receive the joint tender of Messrs. Delessert, Law, and Leigh on the 15th of June, subject to the following conditions:

ARTICLE 1. The line will set out from Brest to terminate at one of the points on the coast between Boston and New York, without touching at any foreign shore. It must be ready for service by the 1st of September, 1869.

ART. 2. The Government engages itself not to make another contract during fifteen years from the 1st of September, 1869.

ART. 3. The rules of the International Convention of Paris, or of any other convention which may be decreed to replace it, shall be applied to the use of these lines.

ART. 4. The price of the despatch of twenty words cannot exceed \$12.

ART. 5. The Government reserves to itself the right of exercising on the service of the cable the control which it may judge fit. For this purpose, the service of the line shall be installed in one of the rooms of the Telegraphic Bureau at

Brest, which must be rented by the holders of the grant from Government; the employees of the Bureau of the Government only to be employed to transmit and receive despatches by the cable.

ART. 6. The contractors cannot unite with any other French or Foreign company of the Transatlantic cable, nor sell out their interests without the authorization of the Government.

ART. 7. If during the term of fifteen years which the Government engages itself not to grant any other permission to lay a transatlantic cable a single cable should become insufficient, owing to the increase of correspondence or to any other cause, the contractors shall be forced to lay another cable within thirteen months from the time from which notice is given them, unless they prefer to renounce the privilege granted them in Article 2.

ART. 8. If during the fifteen years of the cable service communications should be intercepted for a consecutive period of six months, the privilege established in favor of the holders shall be null and void, and the Government will resume the power of granting concessions to other parties.

ART. 9. No parties shall be admitted to this contract who have not first been accepted by the Minister of the Interior, nor until they have paid as security to the "Caisse des Depots et Consignation" of Paris the sum of one million of francs (\$200,000).

ART. 10. Within the three months which follow the 15th of June the contractors will be summoned to show the existence of an anonymous society, regularly constituted in stocks, with a capital of \$5,000,000.

ARTS. 11 to 13. Contain stipulations as to interests of administrators.

ART. 14. The convention of which the present stipulations regulate the conditions will not be final until it has been signed by the Emperor. Signed by the Director General of the Telegraphic lines of France, and approved by the Minister of the Interior.

The Corps Legislatif has been engaged in making new telegraphic regulations during the present week, the most important of which is the reduction in the price of the despatch between any two bureaus in the same department. The department of the Seine, for instance, includes Versailles, St. Germain, and several other small towns—the price of the despatch of twenty words, 20 cents; that of Paris has been 1 franc—it has been reduced to 10 cents, the price remaining the same for the interior of Paris. It is proposed in the new law to lay the wires underground near cities. The renewal of old wires will require an expenditure of several millions of francs.

CANTON, Miss., June 8, 1868.

Mr. Editor:

I do most heartily sympathize with you and your correspondent "G. S.," from Frederick, Md., in your championship of lady operators; and I am surprised and grieved that there should be one operator in the land so purely selfish as to wish to bar women out from an employment so entirely suitable for them. One of the great wants of the age, and especially in this country, is the enlargement of the field of remunerative labor accessible to woman.

Do this, and you free her from the debasing influences and manifold temptations which surround a life of poverty and want, and thus elevate her moral status, and, through her, that of the nation; for the moral status of a community or a nation is ever graduated by that of its women.

Alas! how many hapless women now wander through the streets of our cities ruined and outcast, who might have been shedding the light of virtuous woman around happy homes, had a revolution in this regard only taken place years ago.

Here, in the South, laborers being scarce, and labor sufficiently remunerative, we but lightly feel this great want; but let one travel further North, where the laborers are many and employment scarce and poorly remunerative, and he will be made painfully sensible of this great defect in civilization; and when similar circumstances surround us we will see it likewise here.

I cannot but think that if those gentlemen who have arrayed themselves against female operators will but for a moment consider how many occupations are open to them, and how very few are open to women, and how much women, and through her the community, suffers by this privation, they will join with me in advocating the turning over of not

only telegraphing, but every gentle indoor employment, as far as practicable, into the hands of woman. So mote it be. JUSTICE.

### Extraordinary Eclipse.

The total eclipse of the sun which is to take place on the 18th of August next, will present such a long duration of darkness that astronomers are anticipating it with unusual interest. From near Aden the central line of the eclipse extends to the southern coast of New Guiana, crossing Hindoostan, the Bay of Bengal, the Malayan Peninsula, and the Gulf of Siam on the way; and at certain places on this line the duration of total darkness will be at 6:46. At the date in question the moon will not be more than six hours from its perigee, while the sun will not be far from its apogee; a twofold condition which increases the apparent diameter of the moon, and shows the apparent diameter of the sun, nearly at the smallest. Hence the prolonged darkness. Such a chance occurs but rarely, and we cannot wonder that a strong desire exists to make the most of it in endeavors to solve certain highly important questions in physical science. Unluckily, the southwest monsoon will be at its full blast on the 10th of August, which, with its heavy clouds, will render observation either uncertain or impossible, except on the eastern side of the mountain ranges.

### Pneumatic Tubes.

Governor Fenton has signed the bill authorizing the formation of a Pneumatic Despatch Company in this city for the transmission of letters and light merchandise. A pneumatic tube was exhibited at the American Institute Fair last fall, and attracted much attention. The method of propulsion is very simple. A hollow tube is laid, a car which exactly fits the bore is placed at one end, and the air is then exhausted from the opposite end of the tube, when the atmospheric pressure on the car forces it through the tube. It is said that cars can be safely run by this method at the rate of forty or fifty miles an hour. The first line will be constructed immediately, and if successful, similar lines will be built to all parts of New York and Brooklyn for the transmission of letters and light packages.

A charter for a pneumatic railway has also been granted by the New Jersey Legislature, and it is expected that a large tube will soon be laid between Jersey City and Newark for transmitting both light and heavy freight. If this line should prove successful, the company will build a passenger pneumatic railway through the State. This system is a great improvement over the present railroads. A much higher rate of speed can be obtained without danger to life or limb, and it is claimed that by this method cars can be run at much less expense than at present.

### Pacific and Atlantic Telegraph Company.

The annual meeting of the stockholders of the Pacific and Atlantic Telegraph Company of the United States was held May 5th, at the Board of Trade Rooms. A. F. Marthens was called to the chair when the President and Treasurer read their reports. From these reports it appears that the company have at present 1,853 miles of line, 3,244 miles of wire, and have no debt beyond that arising from the current expense of the lines, and that the treasury has in it a handsome sum of money.

An election of officers for the ensuing year was then gone into. The election resulted in the unanimous election of the following board of officers:

For President—George H. Thurston, of Pittsburgh.

For Directors—John W. Ellis, of Cincinnati; Robert J. Anderson, Edward J. Allen, James L. Shaw, William Varnum, and David McCandless, of Pittsburgh.

**The American Type Writing Machine.**

Heretofore, the very first requisite of the Telegraph Operator, has been *rapid penmanship*, but by a recent and novel invention, called the American Type Writing Machine, the operator is enabled to produce "copy" more rapidly, compact and legible than the very best penman. By the use of this instrument, the students of Porter's Telegraph College may become first class Telegraph Operators, without regard to their capability as penmen. This machine has been perfected, and is now being introduced on Telegraph lines, solely through the agency of the Principal of this Institution, a separate department having been fitted up for this especial purpose.

I remain, very truly and respectfully yours,

E. PAYSON PORTER,

*Principal Porter's Telegraph College.*

We would be glad of more information on so important a subject. Will Mr. Porter enlighten us.—ED.

**Telegraph Line to Camden, Arkansas.**

It is now well-settled that the proposed telegraph line from Monroe to Camden will be built and that speedily. The company which was about organized will, however, retire from the management, having transferred its claims to the Western Union Telegraph Company, which has already forwarded the necessary material from New York to build and equip the line.

We congratulate the business men of Trenton, who were the first to give this enterprise a tangible shape, upon the certain success of their efforts in this matter. It will prove an important step in insuring the success of the New Orleans and Ouachita Valley Packet Line which extends to Camden and is built upon the regular and unsurpassed Trenton and New Orleans packets. Our young friend Mr. G. L. Hernon likewise deserves credit for the energy and devotion he has displayed in getting telegraphic communication extended to Camden. We believe it was through his efforts the transfer was made to the Western Union Company, for which interest in its behalf the Company might well afford to make a handsome return.

A general telegraphic Congress is about to be held at Vienna. It will be proposed to reduce the tariff on despatches between Italy and Germany to 4fr. and to lower the rate in Italy itself very considerably, so that a telegram of fifteen words will only cost 1fr., and 10c. for every additional word. The idea entertained some time ago in Italy, and which had taken the form of serious negotiation, of transferring all the telegraphs from the Government to private enterprise and superintendence, appears to be quite abandoned.

**Interesting Facts.**

A legal stone is fourteen pounds in England, sixteen pounds in Holland. A fathom, six feet, is derived from the height of a full grown man. A hand, in horse measure, is four inches. An Irish mile is 2,240 yards; a Scotch mile is 1,984; a German, 1,806; a Turkish, 1,626. An acre is 1,840 square yards, 1 foot and 8½ inches, each way. A square mile, 1,760 yards each way, contains 640 acres. The human body consists of 240 bones, 9 kinds of articulations or joinings, 100 cartilages or ligaments, 400 muscles or tendons, and 100 nerves, besides blood, arteries, veins, etc. Potatoes planted below three feet do not vegetate; at one foot they grow thickest, and at two feet they are retarded two or three months. There are no solid rocks in the arctic regions, owing to the severe frosts. The surface of the sea is estimated at 150,000,000 square miles, taking the whole surface of the globe at 190,000,000 square miles. Its greatest depth is supposed to be equal to the height of the highest mountain, or four miles.

**An Air-tight Galvanic Battery.**

Mr. Chester, electrical instrument maker, describes in the pages of a contemporary a new form of galvanic battery, the beauties of which are cleanliness, portability, and power, besides entirely dispensing with acids, preventing evaporation and the generation of gas, and obviating the removal of the exciting fluid when the battery is not in use.

The battery is made up of glass cells three inches long and one inch in diameter, inserted in a wooden block; a zinc cover is provided for each glass, and a projection from this zinc cover, running down into the glass, forms the zinc element. The other element is carbon, carefully connected with platinum, and well insulated from the zinc cover. This cover has a plate of soft rubber interposed between it and the glass top, and the packing is made completely air-tight and water-tight by the pressure of two rubber springs pulling the cover firmly down. Connection from one cell to the next is quickly made by short pieces of spiral Springs. The battery is charged by filling the glasses half full of water, adding some bisulphate of mercury, and a little shred of cloth is interposed between the plates so as to retain moisture. To use this battery it is necessary to invert it, and thus allow the fluid to flow over the plates and saturate the piece of cloth. Restoring the battery, the fluid leaves the plates, though a drop remains in the cloth shred, and in this state, simply from these drops of moisture, powerful intensity currents, producing violent muscular contractions, are given off, and this is the case even forty-eight hours after the immersion of the plates. It is evident that if we can employ these currents, resulting from the simple expenditure of one drop of the fluid, usefully, that we have exhausted a very small portion of the force in reserve, and it is also evident that we can, after use, place the battery out of use for an indefinite time, ready, by the expenditure of another drop of fluid, to give off the desired currents. Properly constructed, we cannot see any reason why the arrangement should not last in good power a year or more for occasional effects; and it can be completely renewed at the rate of fifty cells in one hour. One hundred and fifty cells exceed in intensity one hundred cells of Grove. The parts are all quickly replaced, no acid is used, and no gas generated.

A modification of the construction is made use of when it is wished to employ a fluid of greater energy, but which in decomposition produces gas from which the tight cell must be relieved. Insert a tube through the cover, the opening being just half way down the cell, and the surface of the fluid below. Care being used in inverting the battery, this tube orifice is always in the air space of the cell, whether upright or inverted. When, for convenience, a battery of large quantity is desired to be used occasionally, large glasses and elements are employed; but bolts are substituted for the rubber bands to bind down the zinc covers. An exceedingly convenient battery is thus formed for electric cauterization, where the operation is not too extended. The use of rubber bands, however, in batteries of high tension, is far preferable to bolts, or their equivalents. The very high insulation of this packed battery is evident from the retention of its power for forty-eight hours and more, where the exciting power is derived from a mere drop of fluid.—*Scientific American.*

Servile and timid, superstitious and indolent, the Quichuans have not half the spirit of our North American Indians. It has passed into a proverb that "the Indian lives without shame, eats without repugnance, and dies without fear." Abject as they are, however, they are not wholly without wit. By a secret telegraph system, they will communicate between Quito and Riobamba in one hour. When there was a battle in Pasto, the Indians of Riobamba knew of it two hours after, though eighty leagues distant.

**A New Electric Clock.**

A novelty in electric clocks has just been invented in France by M. L. De Combettes. It consists of a long pendulum, on the lower portion of which is fixed the clock face. The weight is a sort of box containing an electro-magnet and armature, which, on being attracted, disturbs the equilibrium of the pendulum, and consequently gives it motion. The movement of the armature is made to transmit motion to the hands of the clock in a manner somewhat similar to the mechanism of the alphabet dial telegraph instrument.

In order to make and break the electric circuit, the movement of the pendulum is made use of, one pole of the battery being connected permanently through the axis of suspension to one end of the electro-magnet, while the other pole is connected to a metal plate, against which a point of the pendulum, in connection with the electro-magnet, makes contact at every beat, thus completing the circuit, and causing the electro-magnet to attract the armature. It is stated that only a weak battery is required, and that two Daniell's cells will keep it working for several months.

**Electric Gas-Lighting.**

Mr. Edward E. Bean exhibited before the Institute of Technology last evening, a new process of lighting street lamps by electricity, which has recently been invented by Mr. Frank Bean, of this city. Mr. Bean's instrument works on the principle of the Morse telegraph, there being an electro-magnet attached to each burner, which is made to operate as a valve to shut off and let on the supply of gas as wanted, and the same power that in telegraphing is used in marking the paper is here exerted on a wheel which turns the valve. By adding together the amounts of pulsation there can be obtained about 50 pounds of power to each valve. Two sets of wires are used, over one of which the "quantity" electricity passes which manipulates the valves, and over the other the "intensity" electricity, which produces the spark. The plan was tried with perfect success last evening, and will soon be publicly exhibited on a larger scale. On Monday next a company will be organized, the Legislature having given them a right to incorporate on a capital of \$300,000. By a new process fifty or more street lamps can be lighted almost instantaneously from a central office, and turned off, when necessary, with equal facility, thereby saving an immense expense.—*Boston Post.*

**New Manganese Battery.**

A battery, composed essentially of peroxide of manganese and a single liquid, chloride of ammonium, has been recently constructed by M. Leclanche, and, according to *Les mondes*, has been already somewhat extensively adopted, or, at least, taken on trial by several telegraph companies on the Continent. It has been long known that peroxide of manganese possesses an electric conductivity similar to that of metals. The author only uses the natural crystalline peroxide of the purest quality. This is broken up and placed in a porous vessel, where it surrounds a carbon plate, forming the positive pole of the battery, the negative plate outside the porous vessel is simply a thick rod of zinc; the liquid which bathes both plates is a concentrated solution of sal-ammoniac. It appears to be a very constant form of battery, and exceedingly economical.

THE wire of a telegraph line just put up between Dover, N. H., and Lake Winnipiseogee, is made of a steel core surrounded by copper. By this construction, it is claimed, the following advantages are secured: superior conducting power with less weight of metal, durability, and a less number of poles on the line.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 8,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, JULY 1, 1868.

OUR issue of to-day is 9,000 copies. The official monthly financial statement of the Western Union Telegraph Company is published regularly in the JOURNAL. Every Stockholder should be a subscriber. Terms one dollar per annum.

**Banquet to Cyrus W. Field, Esq., to be held at Willis's Rooms, 1st July, 1868.—The Duke of Argyll, K.T., to preside.**

57 PALMERSTON BUILDINGS,  
OLD BROAD STREET, E. C. }  
11th June, 1868.

DEAR SIR: I have the honor to inform you that arrangements have been made to give a banquet to Cyrus W. Field, Esq., as an acknowledgment of the eminent services he has rendered to the New and Old World by his devotion to the Interests of Atlantic Telegraphy through circumstances of protracted difficulty and doubt.

The Banquet will be held at Willis's Rooms, on Wednesday, the 1st of July, under the presidency of His Grace the Duke of Argyll, K.T., the Right Hon. Sir John Pakington, Bart., M.P., the Right Hon. Sir Stafford Northcote, Bart., M.P., John Bright, Esq., M.P., Charles Dickens, Esq., and other gentlemen will take part in the proceedings.

Signed on behalf of the Executive Committee.

JAMES ANDERSON.

### EXECUTIVE COMMITTEE.

Sir James Anderson.	The Hon. E. Lyulph Stanley.
Capt. Sherard Osborn, R.N., C.B.	Robert Dudley, Esq.
W. Fothergill Cooke, Esq.	F. W. Chesson, Esq.
Philip Rose, Esq.	Charles Burt, Esq.
Capt. Douglas Galton, C.B., R.E.	J. W. Bushby, Esq.

This proposition to honor Mr. Field has been responded to by the leading men throughout Great Britain, and will be one of the most flattering ovations ever given to a private citizen. It is well deserved. Mr. Field has given a lesson of hope and pluck and courage to the world which it is well and wise to honor. Many in America will join in the banquet given to-day to our countryman and friend.

### British Telegraphs.

The proposition to purchase the lines of the Telegraph Companies in Great Britain has been referred to a committee after the bill authorizing the Government to make the purchase had passed a second reading. We still doubt the consummation of the projected purchase, although it would be much more natural for the system to be absorbed by the British Government than our own, and is within so narrow limits as to be easily and unlaboriously controlled. We believe that the committee now appointed will show its wisdom by allowing the system to be worked by those who have so zealously opened it to public use, and thus encourage the private enterprises of the people. That government weakens the nation it governs when it assumes those labors which stimulate the enterprise and strengthen the manhood of the citizen.

### The Ocean Telegraph between the United States and the West Indies.

THE project for connecting South America and the West Indies with the United States by an Ocean Telegraph meets with great favor in the Antilles, and the Legislatures of the several colonies which are to participate directly in the benefits of this new enterprise are promptly and cordially responding to the application of the International Ocean Telegraph Company for assistance in the shape of subsidies, and the concession of privileges and immunities to facilitate the execution of the work. The Legislative Council of Jamaica are about to pass a bill in aid of the undertaking; and the Demerara Court of Policy has passed a resolution pledging that Colony to contribute a subsidy of \$15,000 per annum for ten years to the Company.

### DEMERARA.

Advices from Georgetown, Demerara, to the 6th inst., have been received.

On the 27th of May, at a meeting of the Court of Policy, a memorial from the International Ocean Telegraph Company was presented, praying for a subsidy in aid of the establishment of telegraphic communication between the United States and the Colony, touching at several of the West India islands. The memorial was supported by resolutions adopted at a meeting held in the morning of the same day, at the rooms of the royal Agricultural and Commercial Society, when the whole question was fully discussed.

His Excellency, the Governor, spoke at some length on the subject, in favor of the memorial, and remarked that under the arrangement now proposed the Colony would have daily communication with the United States, as to the markets and other matters of importance. But one stipulation, he said, which the Imperial Government had suggested, was that no payment should be made until after the completion of the work, and another should be, that the line should be extended to New Amsterdam.

In accordance with his Excellency's views, it was, on motion of the Attorney-General, unanimously resolved "that, it being understood that the British Colonies of British Guiana, Trinidad, Barbadoes and Antigua, and the French Colonies of Guadaloupe and Martinique are requested to contribute toward the expenses of maintaining telegraphic communication between Florida and South America, in certain proportions amounting in the aggregate to \$67,500, this Court pledges itself to recommend to the Combined Court to grant to the Ocean Telegraph Company a subsidy equal to 28½ per cent. of the aggregate amount to be contributed by the other colonies, for the period of 10 years, upon condition of the telegraph being completed within three years, and of public information being furnished gratuitously daily, priority being given to Government messages." The action of the Court in this matter meets with the approval of all the intelligent portion of the inhabitants.

### More Telegraphic Honors.

We see by our exchanges that A. B. Cornell, Esq., son of the Hon. E. Cornell, is spoken of as a candidate for the Lieutenant-Governorship of the State of New York in connection with Gen. Sickles as the candidate for Governor. Mr. Cornell was not long since manager of the New York office of the New York, Albany and Buffalo Telegraph Company. We have no doubt he would fill gracefully the position proposed for him.

We have had a perfect shower of self-closing keys rained upon us, which will have full notice in our next number. Keys and many other things of interest are crowded out by the semi-annual statement of the Western Union Company, which appears on the following page.

### The Telegraph in New Mexico.

FORT UNION, June 27.—Telegraph lines are completed to Fort Union, New Mexico, and will reach Santa Fe next week.

L. G. TILLOTSON & Co., as will be seen by their advertisement, offer for sale a new wire, combining the conductivity of copper with the strength of steel. Thus, one by one the appliances of the telegraph are being brought to perfection. With a good conductor and a good insulator, indoor arrangements are rendered simple and effective. By its superior qualities as a conductor, less weight of this compound wire is required, thus economizing its cost. Read the advertisement.

THE two sons of Dr. R. Ogden Doremus, the well known chemist, while playing in a wooden play-house at the back of their residence, a few mornings ago, accidentally set it on fire. They were unable to escape immediately, and the younger of the boys perished in the flames.

WE call attention to the advertisement of S. S. Stafford, whose inks and mucilage are already well known.

The circular of the TARIFF BUREAU will be found on the 7th page.

### BORN.

In Springfield, Mass., June 24th, a daughter, to George B. Prescott, Esq.

### MARRIED.

At the residence of Thomas Chapman, Esq., Brooklyn, N. Y., E. Prentice Bailey, Esq., of Utica, N. Y., to Miss Hannah Chapman.

At St. Paul's Church, by the Rev. Morgan Dix, George W. Roberts to Nettie, daughter of the late Samuel F. Crissey—all of this city.

In Macon, Ga., Tuesday, June 16, 1868, at Christ Church by the Rev. H. K. Rees, Mr. Wm. A. Benton to Miss Estella E. Stark.

THE English Test of the Brooks' insulator is again crowded out, although we have already given its main features. We publish the following certificate of the value of that insulator:

### BROOKS' PATENT PARAFFINE INSULATOR.

HARRISON BROS. & Co., PROPRIETORS OF THE GRAY'S FERRY AND KENSINGTON WHITE LEAD, COLOR AND CHEMICAL WORKS, CONNECTED BY 125 MILES OF PRIVATE TELEGRAPH WIRES WITH THEIR OFFICE, No. 16 BURLING SLIP, NEW YORK.

105 SOUTH FRONT ST., PHILA., May 27, 1868.

MR. DAVID BROOKS:

DEAR SIR—In reply to your favor requesting us to state our opinion of the BROOKS' PATENT INSULATOR upon our private line between this and our New York Office, we are happy to bear testimony to the perfection of your invention. When our short factory lines, embracing a circuit of about 12 miles, insulated by the ordinary glass insulator, have on many occasions during bad weather almost completely failed, our New York wire, 113 miles, with your insulator, has been in excellent working condition.

We have had much wet weather this spring, but during the hardest rain storms we have had perfect and uninterrupted communication with New York, with little or no escape.

Yours, very respectfully,

HARRISON BROS. & Co.

### S. S. STAFFORD'S

### COMBINED

### WRITING AND COPYING FLUID.

Labelled by me, for the last ten (10) years, ARNOLD'S FLUID Superior to any Fluid used. It is Greenish Blue in color, turning Jet Black, flows freely, dries rapidly, does not set-off in books, gives one or more excellent copies. Has no sediment, can be used to the last drop. It is 33½ per cent. cheaper than any other (so called) combined ink. Used exclusively by the Western Union Telegraph Company.

For sale by all Stationers and Druggists, and at No. 11 Cedar street, New York.

S. S. STAFFORD,  
Chemist, N. Y.

## FINANCIAL REPORT

OF THE  
WESTERN UNION TELEGRAPH CO.EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 BROADWAY, NEW YORK.

June 29, 1888.

To the Stockholders of the Western Union Telegraph Company:

In pursuance of a resolution of the Executive Committee, the Treasurer herewith submits to the Stockholders his financial report made to the Board of Directors on the 10th instant.

As comparatively few of the Stockholders attend the annual meetings in person, it is deemed proper to give to them, through the JOURNAL, such facts and statements relative to the affairs and business of the Company as will be of interest, and enable them to understand the condition and value of their property. This method is not as satisfactory to the Management as to report to them in person, and answer inquiries and make explanations where needed; but it seems to be the only practicable way of communicating with the great body of Stockholders so widely separated.

In submitting these tables, it is proper to state that the advance made to the Russian Extension Company was upon property of that company in possession of this Company, which is ample to repay such advances, and a portion of which has recently been repaid.

## No. 1.

PROFIT AND LOSS ACCOUNT, Dec. 1, 1887, to May 1, 1888.

Gross Receipts.....	\$597,374 47
Expenses.....	349,165 41
Profit.....	\$248,209 06

Showing an excess of profit over the estimate of \$23,209 06.

O. H. PALMER,  
Treasurer.

## AMERICAN COMPOUND TELEGRAPH WIRE.

SUPERIOR CONDUCTIVITY,  
LIGHTNESS AND DURABILITY.

A MOST IMPORTANT INVENTION.

We would call the attention of Officers of Telegraph Companies, Telegraph Builders and Contractors, and the Public, to the new

## PATENT COMPOUND TELEGRAPH LINE WIRE

Manufactured by the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY,  
OF NEW YORK.

This Wire has already been put up on sections of several Telegraph Lines, and its merits fully tested, and the results show that it combines all the good qualities which are claimed for it, viz., Economy, Superior Conductivity, and Increased Strength, with Decreased Weight of Metal.

In its composition are used three metals, either of which is a good conductor, Steel, Copper and Tin; and the superiority of Copper as a conductor over other metals is well known, and but for its ductility rendering its permanent suspension in a pure state intact impracticable, it would have always been used exclusively as a Conductor on Telegraph Lines. By combining it with Steel the desired strength and permanence is attained, and the necessary weight of the line wires reduced two-thirds, thus obviating the necessity for using a large number of poles to the mile, and by reducing the points of contact, lessening the chances for trouble and escape of the electric fluid.

All other Line Wires must inevitably be superseded by this, and such Telegraph Companies as now adopt it will the sooner realize the advantages to be derived from its use over those whose lines are of the old rotten and rusty iron wire pattern.

For further information, call on or address

General Agent.

STICKWELL & CO'S  
EXTRA MUCILAGE

THICK, CLEAR AND ADHESIVE

Who has not used

STICKWELL'S MUCILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the Parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding "or any other man." It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOURS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, 80Z. CONE, 80Z. FLAT, 30Z. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES

## THE UNITED STATES OF AMERICA.

*To all to whom these Letters Patent may come.*

Whereas, C. F. Varley, of New York, N. Y., has alleged that he has invented a new and useful improvement in insulators for telegraphs, and has made oath that he is a subject of the Queen of Great Britain; that he verily believes he is the original and first inventor or discoverer of the said improvement, and that the same hath not to his knowledge and belief been previously known or used; has paid into the treasury of the United States the sum of thirty-five dollars, and presented a petition to the Commissioner of Patents praying that a patent may be issued therefor.

These are therefore to grant to the said C. F. Varley, his executors, administrators or assigns, for the term of seventeen years, from the twenty-first day of April, one thousand eight hundred and sixty-eight, the full and exclusive right and liberty of making, using and vending to others to be used, the said improvement, a description whereof is given in the annexed schedule and made a part of these presents.

In testimony whereof I have caused these [SEAL.] Letters to be made patent, and the seal of the Patent Office to be hereunto affixed.

Given under my hand at the City of Washington this twenty-first day of April, in the year of our Lord one thousand eight hundred and sixty-eight, and of the Independence of the United States of America the ninety-second.

Countersigned and sealed with the seal of the Patent Office.

W. T. ORTO,  
*Acting Sec. of the Interior.*  
A. M. SROUT,  
*Acting Com'r of Patents.*

## UNITED STATES PATENT OFFICE.

CROMWELL FLEETWOOD VARLEY, of New York, N. Y.

Letters Patent No. 76,960, dated April 21, 1868.

Improvement in Insulators for Telegraphs.

The Schedule referred to in these Letters Patent, and making part of the same.

*To whom it may concern :*

Be it known that I, Cromwell Fleetwood Varley, a British subject residing in New York, in the County of New York and State of New York, have invented certain new and useful improvements in the method of and means for renovating or increasing the insulating powers of insulators for electric telegraphs; and I hereby declare the following to be a full, clear and exact description of the same.

My invention consists of improving insulating materials or insulators by saturating them either by boiling, washing, or rubbing with coal tar, naphtha, petroleum, or paraffine oil or paraffine wax. The latter is of necessity applied hot. The former may be applied either hot or cold, but preferably hot. In this way the insulating power of surfaces rendered defective by exposure or other cause can readily be renewed.

I likewise prepare the wooden supports of insulators, viz.: arms, brackets, or wooden pins by saturating them with the above-named material. This is best done by boiling them in it before they are fixed upon the telegraph poles, at a temperature above that of boiling water, so as to expel the moisture; but in the case of arms already fixed to the poles the hot fluid is applied on a dry day. In the case of cracked or otherwise damaged insulators the oil will be found best, as it penetrates the pores and cracks, and resists the rain or moisture.

Having described my invention, what I claim and desire to secure by letters patent is,

1. The use of petroleum or paraffine oil, coal tar naphtha, or paraffine wax for renovating the insulating power of surfaces rendered defective by age, exposure, or other cause as set forth.

2. The use of the above named materials for increasing the insulating power of porous or otherwise imperfect insulators, as set forth.

In testimony whereof I have signed my name to this specification before two subscribing witnesses.

C. F. VARLEY.

MARCELLUS BAILY,  
EDM. F. BROWN,  
*Witnesses.*

78,547.—TELEGRAPH APPARATUS.—Joseph B. Stearns, Boston, Mass.

I claim, 1st, In an electro magnet coil, constructed of two opposing or neutralizing conductors, making each of the conductors of the same length, and giving them each an equal number of turns, as and for the purpose set forth.

2d, A key or other circuit breaker, the back stop of which is connected with the ground by a wire, in which is placed a rheostat or other resistance, and for the purpose set forth.

3d, Combining an electro-magnet constructed as described, or in any other manner, to produce either complete or partial neutralization of its cores, with a key or circuit breaker having a connection between the back stop, or its equivalent, and the ground, through a rheostat or other resistance, as and for the purpose described.

4th, Combining an electro-magnet constructed as described, or in any other manner, by which either a complete or partial neutralization of its cores is produced, with a key or circuit breaker having no connection between its back stop and the ground, as specified.

5th, In combination with an electro-magnet constructed substantially as described, the key, A, the key or circuit breaker, C, local battery, B, and rheostat, F, all constructed and operating substantially as and for the purpose set forth.

78,548.—TELEGRAPH APPARATUS.—J. B. Stearns, Boston, Mass.

I claim, 1st, The combination of a relay consisting of two electro-magnets, so arranged as to act upon the same armature post, in opposite directions, with a key that shall close one circuit before or at the same time that it opens another, when the same are constructed and made to operate substantially as described.

2d, The combination of the relay constructed substantially as described, the sounder key, S, and rheostat, R, when the whole are connected and made to operate substantially in the manner and for the purpose set forth.

3d, In combination with the rheostat, R, the double relay, when the latter is so constructed as to effect the finer adjustments of the forces acting upon the armature or armatures, as set forth.

4th, So arranging the several parts of the apparatus that the resistance offered to the current from the battery at either end of the line is always the same, whatever may be the position of the key at the opposite end.

5th, In combination with the key, S, constructed as described, the rheostat, R, inserted between the key and the ground, substantially as and for the purpose described.

78,478.—TELEGRAPHIC REPEATER.—W. G. Bronson, Wellsville, Ohio.

I claim, 1st, So combining the local circuit, influencing and operating a registering, repeating, or signal instrument in an electro-magnetic telegraph system, with a receiving or relay instrument on a main circuit in said system, as that said local circuit shall stand open when the main circuit is closed, and *vice versa*, all substantially in the manner and for the purpose herein set forth.

2d, An electro-magnetic telegraph relay or receiving instrument, so constructed as that the contact of its armature lever with a suitable connecting point to close a local circuit, shall be broken, and the local

circuit thereby opened when the receiving magnet becomes excited, all substantially in the manner and for the purpose herein set forth.

3d, The combination and arrangement of the armature lever of a telegraphic repeating instrument with the wires of the local circuit, and a connecting or conducting post in said circuit, so as that the local circuit shall be closed through said lever and post when the magnet attracting said lever is inactive, all substantially in the manner and for the purpose herein set forth.

4th, So combining the connecting device in a repeating instrument, whereby the main circuit is closed, with an insulated pin upon the armature lever thereof, as that said main circuit shall be opened when the magnet of the instrument is excited, all substantially in the manner and for the purpose herein set forth.

5th, The improved connecting and conducting post, M, in my repeating instrument, when constructed with a horizontal arm, s, carrying an adjusting screw and connecting pin, r, and combined with an elastic metallic strip, p, from a second conducting post, L, to open and close an electrical circuit, all substantially in the manner and for the purpose herein set forth.

6th, The telegraphic switch, P, constructed of an insulated pivoted plate, provided with metallic strips, each so disposed thereon as that, by a proper alignment thereof, a connection may be formed thereby between any two detached pins or points beneath the plate communicating with the wires of electro-magnetic batteries, to be broken by turning the plate upon its pivot, so as to change the alignment, all substantially in the manner and for the purpose herein set forth.

7th, My improved key or circuit breaker, so constructed as that, when at rest, the main circuit connected therewith shall be closed thereby through its lever, its base plate, and an insulated anvil, substantially in the manner and for the purpose herein set forth.

78,534.—GALVANIC SPECTACLE.—Judah Moses, Hartford, Conn.

I claim the combination with the temples or front of a pair of spectacles, of an electric battery or batteries, so arranged and connected therewith that an electrical current may be caused to pass through the same, substantially as and for the purposes herein specified.

78,495.—TELEGRAPHING.—C. F. Varley, London, England.

I claim, 1st, So arranging telegraphic apparatus as to work by the variation of the increment and decrement of electric potential, and not by the direct action of the electric current itself, as and for the purposes set forth.

2d, The use of an induction coil at the receiving end of the cable, one of its wires being connected between the cable and the ground, and the other or secondary wire, connected with the receiving instrument, as and for the purposes set forth.

3d, The use of a condenser or condensers between the receiving end of the cable and the earth, with or without resistance coils between the cable and the earth, as and for the purposes set forth.

4th, The use of a condenser at the sending end of the cable, with or without resistance coils connecting its two armatures, as and for the purposes set forth.

5th, The use of a condenser at each end of the cable, the cable being connected with the ground through a resistance coil and a battery, so as to keep the cable always negatively electrified, as and for the purposes set forth.

As an experiment, several streets in the city of Edinburgh are being illuminated at night by means of the lime light.

**Sulphuric Acid and Platinum.**

One of the most valuable attributes of platinum, according to the text-books, is that it is unacted upon by acids, yet M. Scheurer Kestner, of Thaur, has shown that not only are the platinum alembics acted upon when used in the manufacture of sulphuric acid, but he has also determined the amount of waste. In an apparatus yielding 8,800 pounds of concentrated acid daily, this production, he found, was attended with a loss of one-quarter ounce of platinum, even when the acid was nearly free from nitrous vapors, and as much as two or three times this amount when the acid was no freer from these vapors than it ordinarily is. New alembics suffer less than those which have been in use for a long time, because of the superior compactness of the metal when freshly hammered. For a remedy, he recommends adding sulphate of ammonia to the acid in the platinum vessel, that salt being decomposed by the nitrous vapors, and its base combining, thereby renders them inert. A still better remedy lies in the discovery that platinum containing iridium is much more durable than the former metal alone, and with a knowledge of this fact, all the platinum worked into alembics on the Continent, is now alloyed with a small portion of iridium.

WILLIAM ORTON,  
President.

**Underground Telegraphs.**

The system of underground telegraph lines insulated with an asphalt compound, noticed so favorably in the Paris Exhibition, has lately been tried with highly satisfactory results by the Royal Engineers in the yard of the Brompton Barracks, at Chatham, England. This system, the invention of Mr. Donald Nicoll, consists in laying down a series of rigid sections, or rods of asphalt containing the wires, in trenches in the earth, as lengths of iron gas-pipe are laid. These sections are in about twelve feet lengths, the conducting wires protruding at the ends, and being alternately left straight and twisted into "cork-screws." In planting the lines, the straight ends of one section are pushed into the "cork-screws" of the next, and so on. The blow of a hammer upon the "cork-screws" ensures perfect contact, and when the junction is filled in with melted asphalt perfect insulation is also effected. In this way a dozen joints may be insulated at once. A prominent feature of this system is that the insulating material is poured in at a temperature considerably above that of boiling water, so that if any moisture settles upon the ends of the sections it is driven off in the form of steam as soon as the melted insulator reaches it. The cost of laying is \$100 a mile.

IMPROVED TELEGRAPH INSTRUMENTS,

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed. His Relays were awarded

**THE FIRST PREMIUM**

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them. Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1885. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-300th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionally stronger magnet, while the resistance will be the same.

**PRICES.**

Relays with helices in bone rubber cylinders, very fine.....	\$19 50

PATENT PARAFFINE INSULATOR WORKS.

No. 22 SOUTH TWENTY-FIRST STREET,

PHILADELPHIA.

All varieties of INSULATORS manufactured at these Works are warranted to excel the usual style of Glass and Rubber more than one hundred fold. In view of the error and delay in transmission, waste and consumption of battery material, the results of defective insulation, its fragile nature and expense of renewal, nothing is more manifest than its economy.

To RAILROAD COMPANIES relying upon the efficiency of their telegraph departments it is of great value.

# JOURNAL OF THE TELEGRAPH.

NO. 17.

NEW YORK, JULY 15, 1868.

VOL. I.

## THE COURTESIES OF SCIENCE.

We published not long ago a letter from Prof. Page acknowledging, in the most graceful and disinterested terms, that although he had supposed himself justly entitled to the credit every where accorded to him in America of the invention of the hammer circuit breaker, yet on finding that Prof. McGauley, formerly of *The Scientific American*, had made the discovery previous to his own, at once gave him the credit, although it cost him considerable labor to ascertain the facts. The frank and manly language of that letter cannot be too often repeated in these days of selfishness and rapacity.

He says:

"I have proceeded on the principle of according to every inventor and discoverer his just dues, regardless of personal and national consideration. If this discovery in his favor should be of any benefit in raising means for his family, I shall rejoice and feel proud that my humble efforts to do justice to a co-laborer in the cause of science have met with such a reward."

Such is the fruit of a truly honorable mind, and worthy of universal imitation.

In a somewhat similar spirit is a recent acknowledgment by Sir W. Thompson, of Glasgow, to the Royal Society of England, that his claims to being the inventor of the reciprocal-electrophorus machine, by which mechanical force is converted into electricity, are properly due to Mr. C. F. Varley, who had discovered and patented an instrument for this purpose eight years before. He says:

"The reciprocal electrophorus principle, which seemed to me a novelty in the communication to the Royal Society and in the *Philosophical Magazine* of last January referred to, had, as I now find, been invented and published by Mr. Varley long before, in his patent of 1860, when it was, I believe, really new to science."

POSTSCRIPT.—Glasgow College, March 30th, 1868.—In looking further into Mr. Varley's patent, I find that he describes an arrangement for making spring contracts instead of the narrow air spaces for sparks, and that he uses the spring contracts to enable him to commence with a very small difference of potentials, and to magnify on the compound interest principle. He even states that he can commence with such a very small difference of potentials, as can be produced by a single thermoelectric current, and by the use of his inductive instrument can multiply this in a measured proportion until he reaches a difference of potentials measurable by an ordinary electrometer. Thus it appears that his anticipation of all that I have done in my "Replenisher" is even more complete than I supposed when writing the preceding."

The history of the apparatus, and how Mr. Varley came to construct it, is somewhat interesting. In the beginning of 1850 he was investigating the cause of the source of electrical power in the ordinary frictional machine, and in the course of a long walk discovered the principle of the instrument now under notice. On his return home he made the following simple experiment, which anybody may perform without difficulty. Two gold-leaf electrometers were used both as stands and to show what was going on. Any glass insulating vessel will do, when the object is only to get sparks from the apparatus. Two tin saucepans of one pint capacity were then placed upon the electrometer, and a cylindrical tin biscuit canister, 3in. in diameter, had a stick of sealing wax attached to it to form an insulating handle. The canister was first inserted in the saucepan, and made to touch the bottom, so that

any minute charge of electricity it might contain was, by the well known law of Faraday, conveyed to the exterior of the saucepan. The canister was then elevated about half an inch from the bottom of the saucepan, and touched by the hand to connect it with the earth. Suppose now the saucepan to have been positive, it imparted to the canister, by induction, a negative charge, without giving up any of its own electricity. The canister was then removed and placed inside the other saucepan, to which it yielded up its negative charge on coming in contact therewith. The canister was next lifted, as before, half an inch from the bottom, and then touched with the finger to connect it with the earth. The negative charge thus produced in the second saucepan by induction caused the canister to take up a positive charge from the earth. The canister was now placed in the first saucepan, to which it immediately imparted its new charge. These operations were repeated again and again, the charge in the canister each time increasing in proportion to the charges in the two saucepans. It was not until the operation had been repeated seventy or eighty times that any divergence of the gold leaves became visible. They now began rapidly to open with each fresh insertion of the canister, and soon sparks half an inch long were readily obtained from the saucepans, the movements of the canister being kept up. The inventor, delighted with his success, in running off to bring Mrs. Varley to witness it, upset the apparatus, and smashed one of the electrometers.

In a very few minutes, however, a very simple insulating stand was made to take the place of the electrometer. A quart wine-bottle was made hot before the fire; its cork was cemented with sealing wax to the bottom of the saucepan, and on inserting the cork in the mouth of the bottle, the apparatus was once more in order.

Care must be taken in repeating the curious electrical experiment just described, not to touch the saucepans with the finger during the operations; neither must the canister come in contact with the saucepan again after it has been touched by the finger. It may take three or four minutes to get sparks by the operations just described, but the matter may be expedited by rubbing a stick of sealing wax, and giving one of the saucepans a small charge to begin with. When the saucepans are worked up to full intensity, the operator, with very little further work may continue taking sparks *ad libitum*.

FARADAY has shown that if a small cubical space be inclosed by arranging square bar magnets, with their like poles in opposition, so as to form a chamber, within that space all local magnetism inferior in power to the magnets employed will be neutralized. The same effect may be obtained with electro-magnets as with permanent magnets, and it is proposed in the *Merchants' Magazine* thus to enclose the compass of an iron ship, as a remedy for the deviation by local attraction. A battery might be constructed to be excited by the sea water flowing through it, requiring no attention as long as the zinc plates lasted.

## The Late Matthew Vassar—Closing Scenes of His Life—His Annual Address.

[Correspondence of the Evening Post.]

VASSAR COLLEGE,  
POUGHKEEPSIE, June 23, 1868. }

Death has to-day entered this institution for the first time. The trustees of the college had begun their annual session at 11 o'clock, and some preliminary business had been transacted, when the venerable founder, Matthew Vassar, proceeded to read his annual address, in which he was in the habit of making suggestions to the Board concerning the management and general interests of the institution. He was in his usual good spirits, scattering kindly words like pearls, but appeared more feeble in body than common, having been afflicted for several months with a functional affection of the heart. He usually stood at the side of the chairman of the Board of Trustees (William Kelley) when reading his yearly address, but to-day he sat in his chair, with a peculiarly benevolent expression of countenance. He had almost finished reading his communication, when a sudden pallor overspread his face, his voice faltered, his arms fell at his side, and his paper dropped upon the floor. The gentlemen near him sprang to his chair, others gathered around, and he was placed near an open window. Miss Avery, the resident physician of the college, was sent for, and appeared in a few minutes, but the spirit had just departed, at ten minutes before twelve o'clock.

The scene was sublime. God put into the heart of this good old man a desire to give half his fortune which he had been for fifty years in accumulating, for the holy purpose of providing the means for the thorough education of women. He did it, and he had labored cheerfully, lovingly and arduously with the trustees in carrying out his noble design. For nearly three years it had been a prosperous seminary of learning. He had lived to see the desire of his heart accomplished, and to be greeted, year after year, on "Founder's Day," by the sweet voices of more than three hundred young women in song, calling him "father," and welcoming him to the temple of instruction he had prepared for their benefit. To-day these loving ones gathered in tearful groups around his lifeless form in the parlor of the Lady Principal, into which it had been conveyed from the library.

An hour before he had been in the same relative position to the chairman and Board of Trustees of the college, which he occupied more than seven years ago, when he handed to them the key of a strong box on the table, containing over four hundred thousand dollars, for the establishment of the college, and said: "And now, gentlemen, I transfer to your possession and ownership the real and personal property which I have set apart for the accomplishment of my designs." He had read nearly all of his suggestions for the enlargement of the sphere of usefulness in which the college is engaged, when the angel of death summoned him to the spirit land. Had a few more moments of earthly life been given him he would have read the following now remarkable closing sentences of his address:

"And now, gentlemen, on closing these remarks, I would humbly and solemnly implore the Divine Goodness to continue His smiles and favor on your institution, and bestow upon all hearts connected therewith His love and blessings, having peculiarly protected us by His Providence through all our college trials for three consecutive years, without a single death in our board, or serious illness or death of one of the pupils within the college walls. Wishing you, gentlemen, a continuance of health and happiness, I bid you a cordial and final farewell. Thanking you kindly for your official attentions and services, and not expecting, from my advanced years and increasing infirmities, to meet with you officially again, I implore the Divine goodness to guide and direct you aright in all your councils."

Mr. Vassar lived to enjoy the fruition of his labors in a great work of benevolence, and it seemed fitting that he should die among his fellow toilers in the field of highest culture of the head and heart of woman, with the implements of that blessed labor in his hands. The death of that good man, whose name is immortal among men, seen in the light of surrounding circumstances, was truly sublime.

B. J. L.

## Correspondence.

### Batteries and their Composition.

To the Editor Journal of the Telegraph:

SIR,—I have been waiting for Mr. Fitch to fulfil the promise made in his last letter and point out some more of Mr. Varley's errors, which he claims to have found.

As in my former letter I was careful to say that I disclaimed any intention to *criticise* Mr. Varley's statements, so I desire now to state that my purpose is not to *defend* them; either the one or the other might perhaps be considered uncalled for and impertinent. However, as Mr. Fitch holds himself "open to criticism" (as his letter certainly is), I have thought that a few remarks from "one of those who deem it necessary to refer to foreign authors to substantiate scientific truth," might not be inappropriate.

In the first place, the "deposition of hydrogen upon the surface of the copper," does render the copper almost "as positive as the zinc," and the diminution of the electric force, is due to this polarization and not to the insulation of the copper as Mr. F. states; because hydrogen has an affinity for oxygen vastly superior to copper and nearly equal to zinc; if this affinity was equal to the affinity of the zinc, then under the theory most generally accepted, the decomposition of water being impossible, no current of force would result, whereas we know that there is a slight current, in the proper direction, equal to the difference of the affinities. "The copper plate in the Daniell's battery" is not "absolutely negative," but is held in a negative condition by the superior tension of the zinc. When the ship owners came to Sir Humphrey Davy, it was not to tell him that copper was indestructible, but the reverse; and Sir Humphrey told them how to save their copper by rendering it negative with metallic zinc.

Shall we rob Bunsen by giving all the praise for constant batteries to Daniell and Grove? asks Mr. Fitch. Certainly we shall not, and do not. Bunsen had nothing to do with solving the question of *permanence* in galvanic batteries. Five years after Grove had read a description of, and exhibited his battery to the chemical section of the British Association, and seven years after Daniell's paper had been published in the Philosophical Transactions, Bunsen showed that when bituminous coal from which the hydrocarbons had been driven, was mixed with a portion of the coal in its natural state, the bituminous matter in the latter would, when certain conditions were complied with, act as a cement to produce a denser form of carbon than either charcoal or coke; but what this has to do with the constancy of the battery, I am at a loss to understand.

It is merely a process for the *manufacture* of a material for the negative electrode; not a *new* material, for graphite or plumbago had already been used with success, and coked coal and wood had only failed because of their porosity and bulk.

To suppose that Mr. Grove was ignorant of the value of carbon is absurd, and in reality Bunsen deserves of us very little, as he discovered neither the conductivity of carbon, nor its powers of resisting the action of nitric acid when cold. To call the battery by Bunsen's name is really doing Grove as much injustice, as though we should call it O'Shaughnessy's, because that enterprising surgeon used gold for his negative plate when in a country where no platinum could be obtained; or Collan's, because he, taking up Dr. Schœnbein's discovery of the passive state of iron in strong nitric acid, made powerful batteries in which that metal was negative. The amount of fame Bunsen has received for this mechanical *invention* is extraordinary, and far exceeds that which he more properly deserves for his really great *discoveries* in chemical and physical philosophy. That Mr. Varley will "yet be convinced that when the Grove battery is newly filled, the surface of the nitric acid acts as the negative plate, and the platinum only as a conductor," I think very doubtful, as he has thought so for a long time, for here is what Mr. Grove himself says (L. and E. Phil. Mag. Vol. 15-290), "If the operation of the battery be watched, the nitric acid as we should expect, changes color, assuming first a yellow, then a green, then a blue color, and lastly becomes aqueous; after some time, nitrous gas, and ultimately hydrogen, are evolved from the surface of the platina."

Mr. Fitch goes a little out of his way to say that "nitric acid is always used in *Grove's* battery," and thus unfortunately stumbles again. The first battery of Mr. Grove consisted of one metal, gold, and two electrolytes, nitric and muriatic acids. Mr. Grove's battery, as used by himself, was of nitrosulphuric acid "formed by previous mixture of equal measures of the two acids." But as a subject for discussion, Grove's nitric acid bears no comparison to Grove's *gas* battery; hence Mr. Varley's prefix, "the *nitric acid* form of Grove's battery" was eminently proper.

There is, however, one expression of Mr. Varley's in which he apparently runs counter to facts, and that is in asserting that if the platinum be immersed in a solution of its chloride an increase of power will result. I say apparently, because if he means that the chloride of platinum is to be used in a Daniell's battery instead of the cupreous sulphate, the negative electrode being platinum, *then* he is right; but, if instead of this, is meant the substitution of the chloride of platinum for nitric acid in the Grove form of battery, he is wrong; Mr. Grove says that the "above arrangement (the substitution of Pt 2 Cl for CUOSO<sub>3</sub>) is *not* the most perfect possible, nor nearly so; that it is very inferior to the nitric acid," &c.

Passing over Mr. Fitch's ideas of the meaning of quantity and intensity, we come to the assertion that he has "obtained a current of electricity by the decomposition of a carbonated alkali without the acid of any metal or material which has an affinity for oxygen," all of which is rightly enough put in italics, for it is thoroughly mysterious, and, probably, vastly important. By a stretch of the imagination, we might understand a "carbonated alkali" to mean a *carbonate* of an alkali, but I, at least, cannot comprehend the latter part, and I will be obliged to Mr. Fitch if he will describe his experiment as well as its result, in his promised "future communication."

And now a few words in regard to "anonymous correspondence." What possible good can it do the readers of the JOURNAL to know the name, birth-place, age, general appearance and residence of a

correspondent? Supposing he does give a name, how do they know it is not fictitious? How, for instance, do they know that "Inventus" really is D. H. Fitch of Oil City, Venango County, Pennsylvania? How do they know, unless like me, they have had quarrels with him, that there is such a person?

In a discussion professed scientific, it appears to me that the name of the party writing is entirely superfluous. To be sure, if the writer happens to be distinguished for his attainments, we will read his article the sooner, but we should not be convinced the sooner. Of two papers by Michael Faraday and Michael Jones, I will surely read Faraday's first, but if after reading them both, I find Mr. Jones' to be the more important, will I hesitate to think so because I had not previously heard of him? Are the letters of Junius the less able that their author is unknown? and, to come a little nearer home, would Maud Muller and Barbarie Frietchie be not so inexpressibly sweet did we not know that our grand old Quaker Poet had written them?

Resp'y your ob't servant,

A TELEGRAPH OPERATOR.

June 20, 1868.

### The Indo-European Telegraph.

We understand that five cargoes of stores, consisting of Siemens' iron posts and insulators and of wire left England last week for Persia. These stores will be transhipped at St. Petersburg into smaller steamers which will take them through the Neva and the Volga to Astrachan, where they will again be transhipped for the ports of Rescht, Lencoran, and Astara, on the north coast of Persia. From these ports they will be conveyed into the interior by mules. It is expected that these stores will arrive at their destination (about 5,000 miles distant) in the month of October, when the erection of the line will at once be proceeded with. The work is to be finished before the end of next year, by Messrs. Siemens Brothers.

The cable of the Black sea is to have three insulated conductors, enclosed by a copper sheath to protect it from oxydation and marine insects.

The Russian and Prussian governments have formally declared that in case of war, the transmission of commercial messages over the new line will not be interrupted.

ENGINEERING.

### Belgian Telegraphs.

Mr. Washburn, the broadly marked Congressman from Illinois, in a fine exordium on the superior enterprise of Europe in at once identifying the telegraph with the postal system, gives some data by which the extent of that enterprise is shown. In 1851, after thousands of miles of American lines had been worked for five years, and thousands of messages were passing over them daily, the Belgian lines were opened for the people. During that entire year the prodigious number of twenty-one messages in the whole kingdom of Belgium, at a cost of \$1.25 a piece were sent daily—or about one message a piece for her commercial towns! Is not that enterprise worthy of a greater people! May not an American Congressman brag of such a government?

And after this enlightened and liberal and enterprising government had worked their telegraph lines for five years, the average number of messages had only reached fifty-five per day for all Belgium, less than is taken in a day by some of our small villages. And yet this is paraded in a government paper as an evidence of the growth of an enterprise under a paternal government, and as a proof of how telegraphs grow thereunder!—Bah!

FREDERICK CITY, MD., JUNE 17, 1868.

To the Editor Journal of the Telegraph:

DEAR SIR: In the northern limits of the Green Mountain State lives a wealthy old farmer named Alpha Allen, a queer specimen of the hard flsted Yankee, who had in some unaccountable manner accumulated quite a little fortune. I never could imagine *how*, unless it was by turning the envelopes of his correspondents inside out to mail his replies in and other similar economical contrivances. Whether he is a lineal descendant of the redoubtable Ethan deponent saith not.

Soon after the completion of the Alton and St. Louis Railroad, via Grand Trunk Railway, and its necessary adjunct the telegraph, Allen came in the Telegraph office to investigate the wonder.

He was anxious to see a message come in, and desired me to show him where the wire was. I pointed out the main wire under the high table, which was adorned with one of Chubbucks Registers, and the old gentleman crept under the table to watch for the first message. He had not long to wait till I received a "call" and gave him notice to look sharp. After copying the message I called out to him and he jumped up very much excited, saying it came so fast he could not see it. "Why," said he, examining the writing, "it has come so quick the ink isn't dry yet!"

H.

WANTED—A SITUATION BY A PAPER OPERATOR.

Address,

"T," Aiken, S. C. office.

June 30th, 1868.

CLEVELAND, June 27, 1868.

Editor Journal of the Telegraph:

In the JOURNAL of June 15th is a synopsis of a test of the Brooks' and Varley's insulator, giving the former the best results.

Is this to be taken as a dry test? If so, what is the good of testing in this manner, and what does such a test demonstrate? Are we in want of a dry weather insulator? I believe that a bare wire if laid along a dry rail fence for a distance of 300 miles, would work fully as well as if strung to 9,000 dry Brooks' or any other insulator. I cannot see why such pains are taken in searching for substances and combinations of substances for the purpose of producing an insulator with greater resistance, since any of the common articles used as insulators are sufficiently good if kept dry. In wet weather, Brooks' insulator, as I believe, is superior to others, not because the solid substance thereof has a greater resistance than any other, but because it is more thoroughly protected from the direct wet and indirect moisture between where the wire touches it and the cross arm, on account of its *form* than any other insulator. If any one can devise a plan to keep *always* a perfectly dry circle over some ordinary substance used for insulation between the wire and the pole, he will have invented a perfect insulator, or rather one that will insulate the line as well in wet as dry weather. Am I right?

Yours truly,

N. O. SCHOOLING.

Democratic Convention Busted by a Woodpecker.

July 8.

To Editor Journal:

Yesterday, in the midst of the great press of business which the democratic convention has given rise to, three of our most valuable Boston wires suddenly gave out. On receiving the lineman's report, we learned the misfortune was caused curiously enough. A woodpecker had built her nest in a pole, weakening it so that it broke.

D.

It is not the first time that a weak and insignificant thing has thwarted the best laid schemes of men and mice.

St. LOUIS, JUNE 24, 1868.

Dear Journal:

Like the clown in the circus — "Here we are again!" Please give your Western scribe an audience.

Up to within a week past, we have had some pretty severe storms in this vicinity, which have kept the repairers unusually busy. Poles were prostrated in all directions. Two telegraph masts on the Missouri river were blown down—one at St. Charles, the other at St. Joseph. They were each upwards of one hundred and fifty feet high. A cable was immediately laid across the Missouri at St. Joseph, but it is feared will not work long in that exceedingly treacherous stream. The masts at Weston, Mo., and Atchison, Ka., stood the blast bravely. Several miles of wire actually melted by lightning on the North Missouri road, but now everything is in apple pie order again.

The Western Union Company is about to extend its line on the Union Pacific Road, E. D., in advance of the track to Fort Wallace. The present terminus of the road is Monument Station, situated 387 miles west of Kansas City, and distant 670 miles from St. Louis. From this it will be observed that the contractors are pushing forward the work very rapidly. The same company has also commenced work on the line between Pilot Knob, Mo., and Columbus, Ky., along the route of the Iron Mountain Railroad; distance 124 miles. The line from here to Edwardsville is now in working order.

Dick Tracy, for many years a favorite operator in this office, visited us a few days ago. Dame Rumor hath it one of our St. Louis belles returned to Kansas with him. May their lines be cast in pleasant places. Our pleasant Superintendent, Col. Clowry, has been on a visit East the past few days, but is expected home soon. The Colonel has detailed Vigus of Topeka to assist Tracy in Atchison. Mr. Hard, of Lawrence, takes place vacated by Vigus at Topeka, and George Parmalee has gone to Lawrence as report operator. Mr. Sam'l Allen has resigned his position in Springfield, Ill. Jim Bay has accepted job of night report operator in Cincinnati. C. M. Knox, the veteran, has also accepted a situation in the Queen City. Jack Conner is working in Indiana.

The operators in this office have, with commendable spirit, taken advantage of the beautiful long summer evenings and formed themselves into a Base Ball Club. By this means they have a couple of hours good out-door exercise every evening. They have gone into this thing with a vim, and with their energetic chief, Mr. J. H. French, who, by the way, is as great a favorite on the ball field as during the more strict discipline of office hours—at the head of it, the club will probably remain a firm, fixed fact for time to come. So let your Eastern clubs beware of Electricity and the knights of the key, when they come this way. Now Mr. Reid, so that those who run may read, don't you think it would be a good idea for other large offices to follow our example? How much better it would be to return home after an hour or two exhilarating enjoyment in the pure, fresh air, than to knock about billiard saloons and bar-rooms till the "wee sma" hours, as some (I was going to say many) of our profession do. Try it boys, just once, and see how different you will feel when waking in the morning with the prospect of a trying day's labor before you. This is penned by one who has "been there" and therefore should be a good judge.

One of our boys, who is a paragon of virtue himself, received a message for a chief divine the other day, commencing "Keno is correct, etc." Judge of their mutual surprise to find it should have been "John is" and so forth. Taking the circumstances into consideration, this is, I think, the best yet.

Eh bien, un autre fois.

VOYAGEUR.

He Don't Insure.

Good morning, Mr. J. D. R.,  
And to THE JOURNAL, too;  
I've just dropped in while passing by,  
To say a word to you.  
Don't move, I'll occupy this chair,  
(How very warm to-day!)  
Ah! lad, just let me have that fan.)  
I have not long to stay.  
"Ice water? Yes, (no, I prefer  
To take the croton pure.)  
Indeed, such days one's tempted most  
To try a water-cure.  
You know the friend I've always been  
To our Insurance Co.?  
(At least I think you do, because  
I've always told you so.)  
At last I've found the reason why  
Men will not be insured,  
And hence I feel almost despair.  
Can selfishness be cured?  
Not quite an hour ago I met  
A brother O. P. R.,  
He looked so ill I felt alarmed,  
And helped him in the car.  
He has a wife and children too,  
And as we rode I sought  
To gently find out if of death  
He ever had a thought.  
I found he had, and he told me  
He never should be cured;  
And after while I asked him if  
He had his life insured?  
He turned on me his large dark eyes,  
And half amazed he said—  
"Insured? why no, what earthly use  
Is money when I'm dead?"  
I found my impulse half divide  
Between a smile and sigh,  
But earnest thought was uppermost  
In what I did reply.  
I told him all the benefits  
That he might thus obtain,  
And with rhetorical pathos,  
Touched off to make it plain.  
That is, I told the kindnesses  
That he might give in life  
To brothers who would after death  
Return them to his wife.  
He listened gravely, tearfully,  
To every word I said;  
But as I finished, raised his eyes,  
And gravely shook his head.  
"No, no," he answered earnestly,  
"I do not like the plan,  
For she may marry when I'm dead,  
And then some other man  
Would share the money with her, and  
I'd rest not in my grave,  
With spirits eyes I'd rather see  
Her working like a slave."  
I scarce believed the words I heard,  
And vainly tried to speak—  
I felt as if I had "been struck,  
And turned the other cheek."  
I left the car at the next street,  
Still dumbly wond'ring, then  
I thought I after this would speak  
Only with single men.

LOGANNE.

New York, July 6, 1868.

PARISIAN ELECTRICAL JEWELS. — M. Trouve has made several new and ingenious applications of electro-magnetism in ornamental trinkets, so that now it is quite common to see at fashionable balls in Paris a diminutive butterfly or humming bird perched upon a lady's head, and fluttering its wings as naturally as possible. The owners of these toys carry concealed in their chignons a small battery and minute Rhumkorff coil, the former composed of zinc excited by a solution of sulphate of mercury, the whole inclosed in vulcanite cells, so that the existing solution cannot escape to the damage of the owner.

Our esteemed correspondent, "Voyageur," whose letters are always welcome, will find his last, designed for the issue of July 1, in our present number. It came just as the forms were locked up. Could we have done so it should have appeared at the time desired.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, JULY 15, 1868.

### A Large Business.

The following shows the business done by the Western Union Telegraph Co. at the New York City office, July 6th to 9th inclusive:

Date.	Commercial Messages, No.	Prem Messages, Words.
July 6th.....	9,650.....	151,569
" 7th.....	8,169.....	147,074
" 8th.....	8,984.....	136,266
" 9th.....	7,143.....	147,918
Total.....	33,946	582,827

Commercial messages estimated at 25 words each, including No., date, address, signature and check..... 848,650

Total number of words transmitted..... 1,431,477

Or about 15,000 words per hour day and night during 4 days and nights! The great bulk of the Press business was done between 10 A. M. and 5 P. M., and notwithstanding its enormous amount, there never was more than 200 words on hand unsent! It was taken fresh from the reporters and sent as rapidly as they could prepare the matter. It was in the printer's hands at distant cities long before it had left Tammany Hall for the New York City papers. On the 8th, in addition to the above, 8,000 words were received from the Convention at Syracuse.

The highest number of operators on duty at any one time at Tammany Hall and at the central office was 47.

During the same period the number of messages sent from and received at the "city line" room, under the management of Miss Snow, in addition to that above stated, was as follows:

July 6.....	2,827
7.....	2,608
8.....	2,703
9.....	3,000

On Friday previous, July 3, the number sent and received in this room was 3,135. The greatest number of operators on duty at one time was 12.

Great credit is due Mr. Brown, Manager; Mr. Marks, Night Manager; Messrs. Downer, Smith and Dolan, Chief Operators, and all their subordinates, and equal credit to Miss Snow, Manager of the City Line Room, and all the young ladies employed under her direction.

### Indian Telegraphs.

From 1857 to 1866, the length of telegraphs in British India increased from 4,163 to 18,890 miles. In the latter year the total expenditure for telegraphs amounted to £253,191, £48,067 of which was for cost of construction; £163,892 on account of working and maintenance, and £41,782 spent in England for stores, freight, &c. The total receipts for the same year amounted to £112,944, £101,306 of which were derived from private messages and other sources, and £11,638 from service messages of all kinds. There has been a large progressive increase of receipts year by year since 1857. 172 offices are now open.

### Election of Directors—Western Union Telegraph Co.

At the annual meeting of the Stockholders of the Western Union Telegraph Company, held in New York, July 8th, the following Board of Directors were unanimously elected:

D. N. Barney,	O. H. Palmer,
R. S. Burrows,	E. S. Sanford,
John J. Cicco,	Hiram Sibley,
Ezra Cornell,	Moses Taylor,
Wm. E. Dodge,	J. H. Wade,
Alfred Gaither,	George Walker,
Norvin Green,	D. A. Watson,
Wilson G. Hunt,	Le Grand Lockwood,
George Jones,	John D. Caton,
Cambridge Livingston,	Z. G. Simmons,
B. R. McAlpine,	Robert A. Lancaster,
Edward D. Morgan,	A. B. Cornell,
Francis Morris,	M. Lefferts,
George H. Mumford,	Edward Creighton.
Wm. Orton,	

At a subsequent meeting of the Board of Directors the officers of the preceding year were unanimously elected.

### The New Board.

We give the names of the new Board of Directors of the Western Union Telegraph Company, from which will be missed that of our old and true friend John Butterfield, Esq., who is fast sinking and cannot long be among living men. When that day comes which brings us news of his decease, we shall feel the right to mourn with many thousands more who have felt the power both of his enterprise and friendship.

### Angle-France Telegraphs.

The recent important reduction in the price of telegraphic communication between France and England is another step toward the increase of commercial and business intercourse between those countries. Since the Cobden Treaty their mercantile relations have constantly been growing closer and more extensive; and, though there has been a good deal of opposition to the various steps in that direction, there is no doubt that they have been greatly for the advantage of both peoples. The new and reduced telegraphic tariff came into operation on the 1st inst., and it provides that for twenty words between London and any part of France or Corsica eighty cents is to be paid, while between any other station in England and France and Corsica the charge will be \$1.20. The English papers give the credit of this measure to the energy and activity of the French Government.

This should be added to Mr. Washburne's paper to Congress. The average distance of transmission will be much less than between New York and Buffalo, on which the charge is 50 cents. Europe is now, after so long a time, learning to accommodate tariffs to the condition and ability of the people, as in America. We are somewhat surprised, however, to find that after all Mr. Washburne has said about European Governmental magnanimity, the charge was more than 10 cents, a sum for which he seems to have an especial reverence.

Col. Serge Abasa, well known for his connection with the Russian Extension Telegraphs, leaves the United States for his home in Russia in a few days. We have rarely met a gentleman who combines so harmoniously the vigor peculiar to his nation, and the quiet and modest refinement of manner which has gained for him a wide-spread and lasting friendship among all who have met him.

Col. Abasa will probably take with him the closing papers of the Alaska purchase.

All letters to persons or officers in 145 Broadway, New York, should show plainly in the address, Box 3398.

### East India Telegraph Co.

This company has sprung into new life under the presidency of Alexander Holland, Esq., a sure sign of progress and success. It seems far away for an American company to operate telegraph lines in India. But all places are near now. The world begins to look small to us—and all men our neighbors.

### What the Girls Can Do.

Over our sanctum is a room where about 15 young ladies may daily be found engaged in telegraphic duties. The room is secluded, airy and agreeable. It is presided over by Miss L. H. Snow, a lady of superior executive ability, and a first-class operator.

On Friday last, July 3d, ten of these young ladies sent and received 3,135 messages between 8 A. M. and 4 P. M., or an average of 314 messages each. On the following Tuesday the same young ladies sent and received over 3,000. The work was done well, neatly, correctly and to their very great credit. With such a record there is no use in doubting the capacity of ladies for this service. The daily number averages about 2,300.

In the above statement there is a very curious commentary on the recent paper of Mr. Washburn to Congress in which he illustrates the immense use of the Swiss telegraphs by reason of cheap rates. Yet the number of messages for the whole kingdom does not average half of the business done in this one small room by 10 intelligent Yankee girls, at 145 Broadway, N. Y.

### In Congress.

Mr. Townsend introduced a bill July 10th to incorporate the United States Postal Telegraph Company, and to establish a postal telegraph system. Referred to the Post Office Committee. It incorporates Gardner G. Hubbard, Samuel W. Bates, Estes Howe, and their associates, in a body politic and corporate, with a capital stock of \$400,000; the Postmaster-General to make a ten years' contract for the transmission of messages. The eighth section provides that if the company shall not make the contract within six months, its incorporation shall be void.

There is not the remotest possibility of Congress passing the bill introduced to-day for the so-called "Postal Telegraph." The Committees of both Houses are unanimous in the belief that the Government cannot profitably or judiciously enter into or meddle with any such business.—*Sun*.

### Central America Telegraph Co.

The following Board of Directors have been elected:

Gen. E. S. Sanford,	Cambridge Livingston,
Hon. Wm. Orton,	Chas. B. Hoffman,
Gen. W. F. Smith,	Wm. G. Fargo,
Alex. Hamilton, Jr.,	Wilson G. Hunt.
Gen. M. Lefferts,	

The following Officers were elected:

Gen. E. S. Sanford, President.
Gen. Wm. F. Smith, Vice-President.
Cambridge Livingston, Secretary.
Marshall Lefferts, Engineer.

The Engineer says it is interesting to watch the behavior of the steam engine used to drive Wyld's electro-magnetic machine, while the machine is employed in heating lengths of rod or wire introduced in the circuit. The engine slackens speed when the wires or rods grow hot, and the resistance increases as the metal increases in heat, and it is only by constant care on the part of the driver that a uniform rate of motion is maintained.

## Tariff Bureau Circular, See 7th Page.

## How a Shrewd Man was Swindled.

"I under pretence of friendly ends,  
And well-placed words of glassy courtesy,  
Baited with reason not unpalatable,  
Wind me into the easy-hearted man  
And hug him into snares."

A pleasant story is told of a stock speculation in which a well known citizen of Springfield, who is usually cautious as to such matters, has burnt his fingers a trifle. Some time ago a new telegraph project was broached to him by a fellow townsman, who merely paved the way for a New York speculator. The latter, in a very persuasive manner, informed the gentleman first mentioned that he desired to obtain the co-operation of just such men as he, at the same time representing that he (the speculator) was doing him a great favor in permitting him to take a stock that was sure to be of such great value to the possessor. Without reflecting on the matter at any great length, the gentleman appealed to subscribed \$5,000. Several other Springfield men put down their names, confident that they were making a brilliant investment. Then came ten and five per cent calls, one after another, and the subscribers generally responded to them. Not so the \$5,000 subscriber. He was satisfied, on a little reflection, that the scheme was a swindle, and allowed the "calls" for cash to go unheeded. The certificates of stock were to be issued when 50 per cent was subscribed, but after 45 per cent had been demanded the call ceased, and to this day the subscribers have obtained no certificates. The stock is now offered for half its paid-in value with the promise of certificates—when they are issued. The Springfield capitalists who dipped into it long ago wished they hadn't, and the one who stood out is only too happy to defend the law suit which will probably be brought against him because he subscribed and didn't pay. What makes the "investment" rather more interesting in his case is the fact that he has usually had a remarkably keen scent for swindles, and a few years ago warned a great many of our citizens against risking money in the Charter Oak coal company, and in the various bogus oil companies, which afterwards proved to be rotten, just as he prophesied they would. His advice was first rate; the only trouble was he forgot in a single instance to heed it himself.—*Springfield (Mass.) Republican*.

It is the old, old story, "Will you walk into my parlor, said the spider to the fly?" There may be round soon a genteel-looking man with a postage stamp on his hat, and the figure of mercury in his hand, inviting participants in the great "Postal Telegraph Company." Walk in, gentlemen, and pay your money. But do it on high-minded principles—loan it—looking not for reward or return. Then all will be delightful.

We welcome to our columns the advertisement of our old friend Chubbuck, of Utica, N. Y., whose name is connected with the earliest days of telegraphing in the United States. The first "pony sounders" were made by him, and his work is always good and beautiful. We have before us the photograph of a very neat sounder by him enclosed in a brass case with glass face, mounted on a bronze statuette.

The first lightning rod put up in this country by Dr. Benjamin Franklin is now to be seen on the old house, 52 Daniel street, Portsmouth, New Hampshire.

## MARRIED.

On Sunday, June 21st, 1868, at the residence of the bride's father, in Nevada, O., by the Rev. W. H. Painter, Mr. W. S. Evans, Manager W. U. Telegraph Office, Oarville, O., to Miss Celia Painter, of Nevada.

At the residence of the bride's father, at Hazelwood, Pa., on June 20th, 1868, by Rev. Samuel J. Wilson, Mr. Frank Lehmer, of Omaha, Neb., to Miss Irene Phillips.

## Lines open to Santa Fe.

The following dispatches were received by the President to-day:

SANTA FE, New Mexico, July 9, 1868.

To His Excellency the President of the United States:

SIR: The capital of New Mexico sends to your capital, and through you to the world, her greetings over the first telegraphic line erected within her territory. Its completion is another advanced step of an enlightened age, bringing an old into instantaneous communication with newer though more advanced sections of our blessed Union, and with mankind in all civilized lands.

(Signed)

H. H. HEATH, Acting Governor.

SANTA FE, New Mexico, July 9, 1868.

To the President of the United States:

To-day the telegraph line from Denver, Colorado, to this city is completed. We, the citizens of Santa Fe, greet you as President of the Republic on the consummation of this work, a sure evidence of our determination to keep pace with the spirit and progress of the times.

(Signed by)

MANY CITIZENS OF SANTA FE.

The President replied to the despatches as follows:

WASHINGTON, D. C., July 9, 1868.

To H. H. Heath, Acting Governor, and Citizens of Santa Fe, New Mexico:

I thank you for your kind greetings, and congratulate you that the capital of New Mexico is in telegraphic communication with the capital of the nation. May the wires serve to render yet more indissoluble the bond that unites the people of your Territory with their fellow citizens of the States.

(Signed)

ANDREW JOHNSON.

The following dispatch was received by Messrs. L. G. Tillotson & Co.:

SANTA FE, New Mexico, July 9.

To L. G. Tillotson & Co., 11 Dey Street, New York:

Line completed yesterday, and working splendidly. Your magnets are O. K.

(Signed)

B. F. WOODWARD, Gen'l Supt.

This evidence of the superiority of Tillotson's instruments was not needed, as they are now universally known; still we are glad to record it.

## Central Division.

The Central Division under the general superintendence of Gen. Stager, is now divided into seven districts:

J. S. Wilson, Superintendent 1st District, Chicago, Ill.		
R. C. Clowry, " 2d " St. Louis, Mo.		
W. B. Hibbard, " 3d " Omaha, Neb.		
T. B. A. David, " 4th " Pittsburg, Pa.		
E. P. Wright, " 5th " Cleveland, O.		
Jno. F. Wallick, " 6th " Indianapolis, Ind.		
Geo. T. Williams, " 7th " Cincinnati, O.		

Gen. Stager will probably before long carry out his long cherished design of making Chicago his home. It is the natural centre for so large and important a field as that under his care. Chicago must remain the great metropolis of the west.

## Telegraphic Suspension of Thought.

Man is merely a machine; even the telegraph can get the best of him without his own knowledge. Individuality is nothing, in comparison with the mighty independence and overpowering mastery of the electric fluid. The human brain may vibrate the mystic chords of memory and all that sort of thing, but the keys of the telegraph can do more. We had evidence of all this ponderosity of what-you-call it over mind, yesterday. Our telegraphic sheets from the Western Union office, containing the usual dispatches from all parts of the country, sandwiched between which was a dispatch from Hartford announcing that a man had been run over by the cars in this city the night before. This dispatch had been telegraphed from New York, to the way papers between that city and Boston, and the operator wrote it off mechanically, without knowing that he did it. We mention the fact as an important illustration of another fact that when the mental hobicum ceases to hyfatum on the carnivorous rinctum, the fusileer of the diaphragm controls the undisturbed forces of the diabolical ashpap. See it?—*Hartford Post*.

## AMERICAN COMPOUND TELEGRAPH WIRE.

SUPERIOR CONDUCTIVITY.

LIGHTNESS AND DURABILITY.

A MOST IMPORTANT INVENTION.

We would call the attention of Officers of Telegraph Companies, Telegraph Builders and Contractors, and the Public, to the new

PATENT COMPOUND TELEGRAPH LINE WIRE.

Manufactured by the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY,  
OF NEW YORK.

This Wire has already been put up on sections of several Telegraph Lines, and its merits fully tested, and the results show that it combines all the good qualities which are claimed for it, viz., Economy, Superior Conductivity, and Increased Strength, with Decreased Weight of Metal.

In its composition are used three metals, either of which is a good conductor, Steel, Copper and Tin; and the superiority of Copper as a conductor over other metals is well known, and but for its ductility rendering its permanent suspension in a pure state intact impracticable, it would have always been used exclusively as a Conductor on Telegraph Lines. By combining it with Steel the desired strength and permanence is attained, and the necessary weight of the line wires reduced two-thirds, thus obviating the necessity for using a large number of poles to the mile, and by reducing the points of contact, lessening the chances for trouble and escape of the electric fluid.

All other Line Wires must inevitably be superseded by this, and such Telegraph Companies as now adopt it will the sooner realize the advantages to be derived from its use over those whose lines are of the old rotten and rusty iron wire pattern.

For further information, call on or address

## OFFICE OF THE

BISHOP GUTTA PERCHA COMPANY,

113 LIBERTY STREET,

SAMUEL C. BISHOP, General Agent.

INSULATED POLE LINE CORDAGE

AND

OUTSIDE OFFICE CONNECTING WIRES.

We have completed some valuable Experiments, and have now the pleasure to offer to Telegraph Companies, and others interested,

THE BEST

AIR LINE

AND

OUTSIDE OFFICE INSULATED WIRES

that can be had

Parties using are invited to examine them at our Office.

SAMUEL C. BISHOP,

May 30, 1868.

General Agent.

## STICKWELL &amp; CO'S

EXTRA MUCILAGE

THICK, CLEAR AND ADHESIVE

Who has not used

STICKWELL'S MUCILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the Parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaniards "or any other man." It is as cheap as the worthless trash sold under another name. It saves the piece. It never SOURS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, 8OZ. CONE, 8OZ. FLAT, 8OZ. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES

S. S. STAFFORD,  
Sole Proprietor, N. Y.

## Our National Schools of Science.

An interesting article in the *College Courier*, published at Yale, sums up the work done in the different states of the Union to establish Schools of Science. We copy:

"Time enough has not yet passed to show in what manner the several States have accepted the grant of Congress, or how they will accomplish the prescribed end. We have before us as we write the legislation pertaining to these colleges in twenty-two northern States, and catalogues or circulars from seventeen of the twenty-two, containing some announcements of the various courses of study. The diversity is very great. In several states, chiefly at the West, the name 'State Agricultural College' is alone employed; several more have retained the congressional phrase, 'College of Agriculture and Mechanic Arts.' In Illinois there is an 'Industrial University.' In Massachusetts, an 'Institute of Technology.' In Connecticut and New Jersey there are 'Scientific Schools.' and in several other states the State University covers up and includes the newly established college, so that it appears only as a department more or less submerged in the comprehensive whole.

"We propose to make a rapid survey of what is doing in the several States.

"California.—After various discussions it seems probable that the College of California established at Oakland some years ago, will yield its charter, its funds, its name, &c., and that a state university, including a scientific college, will be established on the site.

"Connecticut.—The Sheffield Scientific School, a department of Yale college, which has been in successful progress since 1847, received the national grant, and has since very greatly enlarged and improved its course of study.

"Delaware.—Delaware College, at Newark, has become the recipient of the grant in this state.

"Illinois.—An 'Industrial University' has been established at Urbana, Champaign County, with the proceeds of the grant, and has been open to students since the spring of 1868.

"Iowa.—The Agricultural College, established in 1858, in Story County, receives the national land grant, and is to be reorganized.

"Kansas.—An Agricultural College is maintained in Manhattan, Riley county.

"Kentucky.—The Kentucky University, chartered in 1888, has been opened in Lexington, and the Agricultural and Mechanical College of Kentucky has been made one of its departments.

"Maine.—Orono, near Bangor, has been fixed upon as the site of a new institution to be called the Maine College of Agriculture and the Mechanic Arts.

"Maryland.—The State Agricultural College opened in 1850, but embarrassed during the war, has been reorganized and enlarged by the reception of the national grant. It is located at Hyattsville.

"Massachusetts.—This is the only state which has divided the Congressional endowment. A portion of it was bestowed on the Massachusetts Institute of Technology, already in successful progress in Boston, and the rest on an agricultural college established at Amherst, in the vicinity of Amherst College.

"Michigan.—The State Agricultural College, near Lansing, a very successful college commenced in 1857, received a welcome increase to its endowment in consequence of the national grant.

"New Hampshire.—Dartmouth College at Hanover is to have in its immediate proximity a College of Agriculture and Mechanic Arts with the proceeds of the congressional endowment.

"New Jersey.—Rutger's College at New Brunswick receives for the Rutger's Scientific School the land script assigned to New Jersey.

"New York.—The Imperial share received by New York, and the gift of Mr. Cornell, have led to the establishment of a comprehensive University at Ithaca.

"Pennsylvania.—The State Agricultural College in Centre county has become the recipient of the national grant assigned to Pennsylvania.

"Rhode Island.—Brown University is selected by the State of Rhode Island as the repository of the portion of the land grant.

"Vermont.—The University of Vermont at Burlington is to maintain a Scientific Department with the avails of this grant.

"West Virginia.—West Virginia established a new institution at Morgantown, Monongalia county.

"Wisconsin.—The State University at Madison receives the congressional grant for the endowment of the Scientific Department.

HAYANA, JULY 8.

The new submarine cable, lately laid by the Narva, has parted from the buoy to which it was attached. The Narva is now engaged in grappling for it, assisted by the United States gunboat Gettysburg. It is doubtful whether the attempt will succeed, as the probability is the engineers will be compelled to underrun the whole length of the cable. The work will be completed as soon as additional wire arrives from England.

The cholera in this island is unabated.

I claim, 1. The jaws or fork in the armature or armature-lever of an electro-magnetic-relay machine, substantially as and for the purpose herein shown and described.

2. The jaws or fork in the post B, substantially as and for the purpose herein shown and described.

3. The weight T, applied substantially as and for the purpose herein shown and described.

A Courteous Reply.

An American traveller being unexpectedly detained at the mole of quarantine was very civilly offered "half of his apartments and a sofa to lie on" by a young Englishman, who acted as translator to the mole. After they had formed an intimate acquaintance, and had one evening retired to rest, the traveller asked his friend how he could endure the blasphemy which was so constantly heard. The young Englishman replied that "as a gentleman things were disagreeable to him, but as to their being intrinsically wrong it was a matter of no concern to him, as he denied the truth of revelation, and believed Jesus Christ to be an impostor." The traveller without supposing that the remark would be heeded, except by courtesy, replied, "either Christ was an impostor or he was not. If he was an impostor, we have the inconceivable phenomenon of a base man practicing virtue, self-denial, charity, forgiveness of injuries through his whole life, in spite of scourging, contumely, and even crucifixion. Is it philosophical to suppose that a bad man would take so much pains to make men good? But if he was not an impostor, then he has told the truth and we must believe him?" "Is it possible that I never saw that before?" was the only reply of the young Englishman; but the argument sunk deep into his heart, and when the traveller had arrived at Alexandria, he received a letter from the former skeptic, acknowledging him as the "best friend he ever had," encouraging him to be equally faithful to others, and praying him not to forget his "Odessa convert."

## Telegraphers'

## Mutual Life Insurance Association.

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

J. D. REID, Treasurer.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

## DIRECTIONS TO APPLICANTS.

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage: and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

## TARIFF BUREAU.

## Semi-Monthly Circular.

EXECUTIVE OFFICE,  
 WESTERN UNION TELEGRAPH COMPANY,  
 145 Broadway, New York,  
 July 15, 1888.

## To all Offices on W. U. Lines—

The following changes have occurred since July 1st, the date of the last Tariff Order. Please note them in your Tariff Book:

## NEW OFFICES.

Chappell Hill, Tex., tariff same as Brenham, Tex.

Cresson Springs, Pa., tariff same as Cresson, Pa. (offices will add the rates for this and other lines together for their tariff to Cresson Springs.)

Dent Sta., Mo., tariff same as Iron Mountain, Mo.

Larkinsville, Ala., tariff 125 from Louisville and 225 from Washington.

North Hatfield, Mass., tariff same as South Deerfield, Mass.

Shelburne Falls, Mass., tariff same as Greenfield, Mass.

South Pass City, Dac. tariff same as Salt Lake City, Utah.

Williamsport, Ind., tariff same as Attica, Ind.

## THE FOLLOWING ARE "SUMMER OFFICES."

Coney Island, N. Y., tariff 30 and 3 from New York, check New York.

Bedford Springs, Pa., business for this point will be checked to and at the same rate as Bedford, Pa.

Boars Head, Hampton, N. H., tariff same as Hampton, N. H.

Ocean House, Rye Beach, N. H., " " " "

Jackson, N. H., tariff same as last season.

Profile House, N. H., tariff same as Conway, N. H.

Crawford House, N. H., tariff same as Conway, N. H.

Glenn House, N. H., tariff same as Conway, N. H.

Western Union Offices have been opened at Marietta, Pa., tariff same as Columbia, Pa. Huntingdon, Pa., tariff same as Altoona. Downingtown, Pa., tariff same as Lancaster, Pa., and Johnstown, Pa., tariff will be the rate for this and other lines added together. "Special Rates" to Columbia and Lancaster will be used by officers having "Special Sheet A," as the tariff to Marietta and Downingtown. Offices between Pittsburgh and Philadelphia will use the rate given on P. R. R. tariff sheet for the offices in Pa. just named.

## OFFICES OPENED ON OTHER LINES.

Rocky Point, R. I., "Summer Office," tariff 30 and 3 from Providence, R. I., check Providence.

Unionville, Orange Co., N. Y., 25 and 2 from Middletown, N. Y., check Middletown.

Atlanta, Mo., tariff 85 and 7 from St. Louis, check St. Louis.

Brunswick, " 100 and 8 " " "

Columbia, " 85 and 7 " " "

Dalton, " 100 and 8 " " "

Huntsville, " 90 and 7 " " "

Salisbury, " 95 and 7 " " "

Offices on Ill. and Miss. Co.'s Lines will use the "Map Tariff Scale" to the points just named instead of the rates from St. Louis.

Ft. Union, New Mexico, tariff 300 and 20 from Denver, Col., check Denver.

Los Vegas, New Mexico, tariff 300 and 20 from Denver, Col., check Denver.

Santa Fe, New Mexico, tariff 350 and 23 from Denver, Col., check Denver.

## OFFICES CLOSED.

Carey, Kenton, Belle Centre and West Liberty, O.; Edwards Depot, Miss.; Wheatland, Ind.; Living Springs, Col.; and Big Laramie, Dac.

## GENERAL INFORMATION.

Offices having "Special Sheet A" will use the "Special Rate" to Philadelphia, Harrisburgh and Pittsburg, when computing the rate to points on the Penn. R. R. named in Circular dated June 1st, 1888. Also, check Sanborton Bridge, Lake Village and Laconia, N. H., 10 cents; Meridith Village, N. H., 20 cents, and Holderness, N. H., 30 cents more than "Special Rate" to Franklin, N. H. Columbia, Pa., same as Special Rate to Lancaster, Pa.

Hereafter the tariff to Lansingburg, N. Y., from all offices East, South and West of that office will be 10 cents more than rate to Troy. Offices North will check Lansingburg at same rate as Troy.

WILLIAM ORTON,  
 President.

M. Blondlot asserts that when phosphorus produces ozone by its slow combustion in presence of water, phosphoric acid is produced, which, in contact with excess of phosphorus, is partly transformed into phosphorus acid.

IMPROVED TELEGRAPH INSTRUMENTS.

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed. His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them. Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 13, 1863. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

## PRICES.

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	18 00
Main Sounders same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package.

VOL. I.

## The English Banquet to Mr. Field.

*From the London Star.*

Mr. Cyrus Field is too earnest and energetic a man, too completely devoted to great projects and great success, to have much of mere egotism left in him. A life so thoroughly absorbed in pursuits which belong to the business and benefit of the whole world can have little time for the indulgence of vanity. But one might excuse a little self-gratulation and pride on the part of a guest entertained as Mr. Cyrus Field was at Willis's Rooms last night. Not often, certainly, is such a banquet given in England to a man who is neither a politician nor a soldier. In England we are, perhaps, slower even than any other civilized people to recognize and do homage to the genius which works for our benefit by the way of scientific discovery and adaptation. Mr. Field, when he glanced around that splendidly filled banquet-room last night, must have felt gratified at the evidence thus practically and brilliantly afforded that the public of civilized nations are at last trying to unlearn the fatal habit which made them so long ungrateful to some of their best benefactors.

We never remember to have read of a public demonstration to any individual in London which had less of sectarian or sectional character. The Duke of Argyll, one of the most advanced of our Liberal peers, one of the most enlightened of our scientific thinkers, was hardly more prominent in doing honor to Mr. Field than was Sir John Pakington, the steady-going Tory of the old, old school. Lord Stratford de Redcliffe, the great Elchi of Mr. Kinglake's delightful sensation romance, sat side by side with Mr. Bright, who denounced in such powerful and unsparing eloquence so much of Lord Stratford's policy and conduct during the Crimean war. Mr. Layard joined with Sir Stafford Northcote in the compliment to the guest. Two common sentiments animated the whole of the company—a company representing politics, science, literature, arts, and commerce—the sentiment of personal admiration for Mr. Field's labors and character, and that of cordial friendship towards the great people of whose indomitable energy he is so striking an illustration. The speaking was all, or nearly all, as unexceptionable in good taste as it was in good feeling. The Duke of Argyll spoke with that clear and thoughtful eloquence which becomes one of the only living peers—might we not, perhaps, say the only living peer? who has made pure science and philosophy a genuine study. Sir John Pakington was good-humored and appropriate in his anecdotes and reminiscences. Sir Stafford Northcote was at once earnest and genial; nothing could be in better tone than the short and seamanlike speech of Admiral Sir A. Milne. Mr. Bright made the occasion one for a noble and thrilling lesson of peace, friendship and civilization to both peoples. The general character of the assemblage was that of a company feeling a deep and even a profound interest in the proceedings of the evening, and in the services rendered to the world by the distinguished guest. Not ignorant of what public demonstrations of honor usually look

like, we must say that it would be hard indeed to point to any occasion when so large and miscellaneous an English company was so sincere and so enthusiastic in paying homage to a distinguished guest.

Much of the honor of course was entirely personal. It was tendered to Mr. Field because he individually had deserved it. Mr. Bright, in a few words, accurately described Mr. Field's position as regards the Atlantic Telegraph. Other men may have thought of the project; other men may, for aught we know, have thought of it even before he did; other men may have mentally planned it out, and proposed schemes for its realization. Other men have actually contributed by their science, their skill, their patience, their capital, their genius to make the idea a success. The idea is not exclusively Mr. Field's; nor is the success exclusively his. But, assuredly, his was the energy, the prodigious strength of will, the unconquerable perseverance which forced the scheme upon the intellect, the activity, and the influence of England and America, and never desisted until the dream had become a reality. A slight and delicate allusion was made once or twice last night to the sacrifices Mr. Field had made, the responsibilities he had incurred, the risks he had run, to bring forward his darling scheme again and again after each new defeat and disaster. There are more men by far who could bear to make the sacrifices than men who could raise their heads as Mr. Field did, undismayed after every defeat, full of new hope after each disaster. Certainly that glorious vitality of hope is one of the rarest as it is one of the grandest of human attributes. Mr. Field brought to the great project with which his life will be identified more than the genius of a discoverer—he brought the courage, the energy, the heart and hope of a very conqueror. Therefore was his share in the work so unique; therefore did the company at Willis's Rooms last night do him special honor. But in honoring him they honored also his country. Better words, holier messages of peace and brotherhood, were never sent along a wire than those which thrilled last night through the depths of the Atlantic, from the Englishmen around Mr. Field to the brethren of their race in America.

## The Compass in Iron Ships.

It is well known that great trouble has been caused to mariners by the action of the mass of iron in iron vessels, causing disturbance to the magnetic needle. In our last number we published a plan of Faraday's, in the use of magnets so placed around the needle as to neutralize the ship's disturbance.

A very simple method of removing this cause of trouble has recently been discovered, which, if correct, will be a welcome solvent to this nautical disturbance. By so bisecting the ship as to place a layer or slip of copper between the two halves, so that the continuity of the iron mass shall be broken in the centre, the action of the compass is severed from disturbance, the action of the separated masses neutralizing each other in their influence on the needle.

## Hen Faxon and Blondin.

The following little paragraph, which is going the rounds, is true: "Some years ago, there was a rope-walker by the name of Blondin, amusing the people in various parts of the country. In the course of his travels he came to Buffalo, where he practiced his feats. One day he was astonished to see an announcement in a morning paper that he was intending to stretch a rope across the Niagara chasm, and astonish the public by walking over it. Blondin, in a tearing passion, visited the office of the offending paper, and sought the author of the canard. He found him (Hank Faxon, inventor of the Silver Lake snake story and other romances; he is dead now, poor fellow), and abused him roundly in broken English. Faxon received him good-naturedly, and told him the thing was a joke, and wouldn't hurt his professional business half as much as it would help it. Blondin was calmed, became thoughtful, and finally said: 'By Gar, I go do that very thing.' The American public knows whether he did it, and how well he succeeded." "Hen" Faxon, the person spoken of above, was some fifteen years ago a telegraph operator in this city, and was widely known here as one of the most genial and witty fellows in the world. Many is the tradition that still obtains among the older operators of the State of the pranks which he played upon them, and which, being known along the line simultaneously, were always certain to raise a laugh in a dozen different cities at once. One day Hen's humor went a little too far, and the Superintendent of the line gave him a "vacation" from the office. We next heard of him in Buffalo as the city editor of the *Republic*, where he gained almost a world-wide fame as the author of the Silver Lake Snake story—one of the most original and quaint fictions that ever was palmed off upon the public. The Blondin story related of him above is strictly true; the most perilous feat ever performed by a rope-walker, had its origin in the fanciful brain of Hen Faxon. Subsequently, we regret to say, poor Hen became dissipated, entered the army, and died. With more wit and originality than Artemus Ward, Josh Billings, or any of the present race of humorists, he might have made a reputation which would have eclipsed the fame of any one of them; but he chose to fritter away his time and talents, and to-day is only remembered by the few who knew and appreciated his character and talents.—*Troy Times*.

A PARIS correspondent says he has just overheard a prayer at Notre Dame: "Oh, beloved Saint Joseph," murmured a rosy little grisette on her knees before the flaming taper she had just lighted in his honor, "grant me a good husband, plenty of ironing to do, shirt collars without starch, and charcoal without smoke; and to my dear old aunt a speedy death. All these blessings as speedily as may be."

THE best thing to give to your enemy is forgiveness; to your opponent, tolerance; to a friend, your heart; to your child, a good example; to a father, deference; to your mother, conduct that will make her proud of you; to yourself, respect; to all men, charity.

### The Law of Telegraphs—Liability of Telegraph Companies.

TYLER, *et al.*,  
vs. } In the Superior Court of Chi-  
WEST. UNION TEL. CO., } cago, June Term, A.D., 1868.

HON. JOSEPH E. GARY, Chief Justice, presiding.  
The plaintiffs, Tyler, Ullman & Co., of Chicago, Bankers, sued the Western Union Telegraph Company, to recover an alleged loss of \$729.77, sustained by reason of error in the transmission of a despatch by the defendants.

The plaintiffs proved the delivery to the defendants, at their office in Chicago, on the 29th of October, A.D., 1868, by Tyler, Ullman & Co., for transmission to J. H. Wrenn, of New York, of the following telegram:

CHICAGO, Oct. 29th, 1868.

John H. Wrenn, care Gilman, Son & Co., N. Y.:—Sell one hundred (100) Western Union. Answer price.

T. U. & Co.

That by "one hundred Western Union," was meant one hundred shares of the capital stock of the Western Union Telegraph Company. For transmitting this despatch the plaintiffs paid \$2.05. The plaintiffs further proved that the telegram, as delivered by the defendants' agents in New York to, and received by Wrenn, was as follows:

"John H. Wrenn, &c.:—Sell one thousand (1000) Western Union. Answer price.

T. U. & Co.

That on receipt of said telegram, Wrenn sold one thousand (1000) shares of the capital stock of the Western Union Telegraph Company, and on the 30th October, telegraphed to Tyler, Ullman & Co., at Chicago, as follows, viz.:

"Sold one thousand (1000) Western Union at fifty-three (53). Leading broker in this market says it is going higher.

J. H. WRENN."

That immediately on receipt of said last telegram, Tyler, Ullman & Co., telegraphed to Wrenn as follows, viz.:

CHICAGO, Oct. 30th, 1868.

"John H. Wrenn, care Gilman, Son & Co.:—Ordered one hundred (100) not one thousand (1000) Western Union sold. Cover nine hundred (900).

TYLER, ULLMAN & Co."

That, on receipt thereof, said Wrenn, who was one of the firm of Tyler, Ullman & Co., bought nine hundred shares Western Union Telegraph stock, for which he paid the following rates, viz.: 200@53½, 100@53½, and 600@53½. That the loss occasioned thereby, including commissions, &c., was \$729.77, for which they had demanded payment of the company.

The defence offered was that the original despatch was written upon one of the blanks then in use at the company's office, in Chicago; and the evidence of the company's employees in Chicago, tended to show that the form of the blank used was that upon which messages for transmission are usually required by the company to be written (and known to operators as No. 2), ending with these words:

"Send the following message, subject to the above conditions."

That by the terms of the notice upon the blank, the company could not be held liable beyond the amount paid for transmission in the case of an *unrepeated message*. It was proved that the message in question was an *unrepeated message*, and that it was written upon one of the blanks then in use by the company, at Chicago, but there was some confusion in the evidence as to what particular form of blank was used, the original being lost. After argument of the cause, the court instructed the jury as follows, in behalf of the defendants, refusing the instructions asked by the plaintiffs, viz.:

"If the jury believe from the evidence that the message delivered by the plaintiffs for transmission to J. H. Wrenn, in New York, was written upon one of the company's blanks, the same as, or similar to one of the blanks exhibited by the witness, Rankin,

then the plaintiffs can recover but \$2.05, the amount paid for transmitting said message."

The jury found for the plaintiffs, and fixed the damages at \$828.70, and the defendant moved for a new trial. On granting the motion for a new trial, the Court said:

"The verdict of the jury cannot be allowed to stand. It is clearly established by the authorities adduced that telegraph companies are not common carriers in the sense of the common law. They have a right to limit their liability, as the evidence shows was done in the case, by the use of a blank. The evidence establishes clearly that such a blank was used by the plaintiffs, and the verdict of the jury is contrary to the law and the evidence of the case. Motion for a new trial granted."

The rulings of the court in this case are but corroborative of decisions by the courts of most of the other States in which the same questions have been discussed; and we hope to see them prevail everywhere as the nature of the service which telegraph companies undertake to perform becomes better understood.

We publish the case because it was elaborately argued by counsel on the trial; because it is, so far as we are informed, the first case of the kind in which there has been a judicial enunciation of principles in the State of Illinois; and because it is likely to receive the approval of the bench and bar throughout the wide extent of country in which the opinions of the learned judge who presided are justly recognized as authority.

JAMES M. JONES, Esq., of Cleveland, Ohio, appeared for the defendant, and deserves great credit for his handsome legal victory. The learning, ability and perseverance he has shown heretofore lead us to expect like success in the cases to which the same defendant is a party, and which are now pending in other courts, where he appears as their attorney.

### The Cornell University.

The return of President White, from a brief but discriminating visit to Europe, naturally attracts attention to Cornell University. This young and vigorous institution has secured an enviable pre-eminence for the emphasis given to particular studies. Besides the usual college curriculum, special pains are bestowed upon mechanics, agriculture and the useful sciences and arts. All the professors are keenly alive to the requirements of our expanding and exigent modern life, and in Goldwin Smith, as well as Mr. James Law, the faculty will receive an enforcement which will give their institution a splendid and wide-spread national reputation.

The recent tour of the head of the University has been attended with such results as will place Cornell in the front rank of American Educational Institutes. Over fifty thousand dollars have been expended in books, models and apparatus. As the library was previously supplied with a superb collection of works on history, architecture and science, the fresh additions will insure such completions in the catalogue as must materially enhance the reputation of the University with scholars.

We are glad to notice the name of Mr. J. H. Larcomb in connection with the City of Washington Fire Alarm Telegraph, to the management of which he has recently been appointed. Mr. Larcomb has been connected with the telegraph now nearly 20 years, and was always known as among the most skillful and energetic which the early years of the enterprise produced. We are sure that in this new field he will give to it all the energy and ability which distinguished him when he and we were associates in labor. Of his ability for the post assigned him, there can be no question.

### Re-organization of the East India Telegraph Co.

On account of the necessary absence in Europe of Mr. Holland, late President of the above Company, the following important appointments have been made, which cannot fail to add to the vigorous prosecution of the Company's plans:

#### DIRECTORS.

Hon. Andrew G. Curtin, Philadelphia.  
Paul S. Forbes, Russell & Co., China.  
Fred Butterfield, Fred Butterfield & Co., New York.  
Alexander Holland, Treas. Am. Ex. Co., New York.  
Isaac Livermore, Treas. Mich. Central R. R., Boston.  
Hon. James Noxon, Syracuse, N. Y.  
O. H. Palmer, Treas. Western Union Tel. Co., New York.  
Fletcher Westray, Westray, Gibbs & Hardcastle, N. Y.  
Nicholas Mickles, New York.  
Andrew G. Curtin, *President*.  
Nicholas Mickles, *Vice-President*.  
George Conant, *Secretary*.  
George Ellis, (Cashier National Bank of the Commonwealth),  
*Treasurer*.

Subscriptions to the balance of stock to be sold in the United States; application may be made at the office of

The East India Telegraph Co., 23 and 25 Nassau street, N. Y.  
The National Bank of the Commonwealth, New York.  
Messrs. Jay Cook & Co., Washington, D. C.  
The First National Bank, Washington, D. C.  
Messrs. C. D. Head & T. H. Perkins, 31 and 33 City Exchange, Boston, Mass.  
Messrs. Lee, Higginson & Co., 40 State street, Boston, Mass.  
Mr. Henry H. Ormsbee, Providence, R. I.  
Messrs. J. L. Brownell & Bro., 28 Broad street, New York.  
Messrs. Charles F. Chase & Co., Baltimore, Md.  
Mr. W. R. Higby, Cashier, Pequonnek National Bank, Bridgeport, Conn.  
The Merchants' National Bank, Syracuse, N. Y.  
The Syracuse City Bank, Syracuse, N. Y.  
Drexel & Co., Philadelphia.

WE have received from Gov. Rufus B. Bullock, of Georgia, who not many years ago was one of our own fraternity, his inaugural message, dated July 24th. To two sentences in it we refer as indicative of the spirit which pervades it.

"With natural advantages unsurpassed, we have but to practice economy, the energy and the arts of our neighbors in other States less favored by nature, to insure for ourselves ease, contentment and material advancement.

"With thankful hearts to the Giver of all good for that which we are now blessed, let us by charity, forbearance and fortitude, merit an increase of His bounty."

To the arduous and responsible post to which Mr. Bullock has been called, he has our hearty sympathy and desire for his complete success.

### Writing on a Screen.

BY PROF. ALBERT R. LEEDS, OF HAYFORD COLLEGE, PA.

Every lecturer has felt how unsatisfactory it is to write or draw, or in any manner attempt to illustrate his ideas in a large room. This difficulty may be overcome in the following manner: A plate of glass is placed in the lime-light or magnesium lantern, and an inverting prism, put in the forward part of the draw-tube of the objective. If now, while looking and lecturing to the audience, writing is done with an ordinary pen and indian-ink upon the glass plate, and proceeding from left to right upon the plate, it will advance correspondingly upon the screen, and will be read in greatly enlarged characters by those present. The square prism inverts with respect to bottom, and the writing being actually reversed by the writer in reference to the other direction in which the lantern is pointing, the crossing of the rays produced by the lens becomes in this case an advantage, and corrects the letters upon the screen. A collodion film, blackened by exposure to the sun's rays, may be substituted for a naked glass plate to great advantage. On such a film chemical and mathematical formulæ, drawings of apparatus, machinery, crystals, anatomical delineations, &c., may be cut with the utmost delicacy, and appear as intensely bright white lines on a black ground, and with something of the appearance of an immense copper-plate engraving.—*Am. Journ. Sci.*, May, 1868.

### Napoleon III. as an Electrician.

[From the Journal des Telegraphes, Paris.]

On the 29th of May, 1843, the Academy of Sciences, presided over by M. Poncelet, accorded the privilege to the celebrated Arago to explain the theory of a new voltaic battery, communicated by letter to the illustrious scholar. This letter was dated from the Fortress of Ham, and was signed by the Prince Louis Napoleon. It did not find its way into the archives of the Institute, and the works of the Emperor alone took notice of it, as follows:

"FORTRESS OF HAM, April 23, 1843.

"The idea I submit to you to-day relates to a theory I have conceived of the functions of a voltaic pile. The source of galvanic electricity has been attributed by Volta to the contact of two dissimilar metals. Davy has adopted this opinion; but since then some savans, and among others the illustrious Faraday, have given the opinion that the chemical decomposition of metals is the sole cause of electricity. Adopting this last hypothesis, I have reasoned thus: As in the pile there is never but one of the two metals which should be oxidized, so, if the electricity is only due to chemical action, the second metal ought only to take a secondary part in this operation. What part? That, I believe, of holding and conducting the developed electricity. By the first, of an analogous manner to that which passes in an ordinary electric machine. In effect in this: The electricity disengaged by friction crosses a middle imperfect conductor, which is air, and is held and conducted by a perfect conductor, which is metal. In the pile, the electricity produced by the oxidation of any metal that crosses a middle imperfect conductor, which is the liquid, and is received and transmitted by a perfect conductor, which is the adjacent metal—this idea appears to me so clear and simple that I will find a way to prove the exactitude by experiment. I reason thus: If it is true that one of two metals employed in the pile serves only to conduct, you can replace it by an identical metal to that which oxidizes itself, provided that it is plunged in a liquid which, permitting the electricity to pass, does not attack this metal. Experiment has confirmed my prevision. I construct two couples, following the principle of Daniell's constant-current battery, but with one metal only. I plunge a copper cylinder in a liquid composed of water and nitric acid, all contained in a porous earthen tube. I surround this tube with another copper cylinder, plunged in water mixed with sulphuric acid, which does not attack the copper. Having established the communication as one ordinarily practises it, I decompose with this battery of two cups the solution of ioduret of potassium, and, having placed at the extremity of the poles two copper plates plunged in a solution of the sulphate of the same metal, I gather at the poles which were connected a deposit of copper. I make a second experiment, with zinc alone. I put in the porous cup some zinc, with water and sulphuric acid, and I surround this tube with another zinc cylinder plunged in pure tepid water, with two similar couples. I decompose equally the ioduret of potassium, and obtain, in taking the necessary precautions, a deposit of copper at the pole which was in connection with the attached zinc as before. Now I will reverse the usual order of metals, and put the copper in the centre of a tube plunged in water and nitric acid, and I will surround the porous cup with a zinc cylinder plunged in pure water, and I obtain a strong battery.

"I should like to be able to measure with care the different forces of the electric currents produced, but it has been impossible for me to do it for want of a galvanometer. My efforts to construct one do not succeed, because the magnetic needles are always swerved by the attraction of iron bars which surround my windows. However, after experiments that I have been able to make, it seems to me demonstrated—

"1st. That in the pile the cause of electricity is purely chemical, since two metals are not necessary to produce a current.

"2d. That the metal which is not oxidized only transmits the electricity.

"3d. That each metal is positive and negative to itself or others following the liquid into which it is plunged.

"I give you, sir, these reflections with a certain reserve, for I have not made chemistry and physics my special study, for it was only last winter that, in order to shorten the hours of my captivity, I made some experiments, and studied with most lively interest the works of illustrious men," &c.

This theory, as we see, is not without value, since, in the same year, the Prince Lucien Buonaparte occupied the Academy with his interesting discoveries upon the lactate of quinine, and upon *la cerium et la didymum*. The learned Assembly also wished to encourage profound studies, and ordered the insertion upon the journal of the following:

"Although the Prince Napoleon has been preceded by M. Becquerel in the construction of a battery composed of elements of one metal, we believe it our duty to publish his letter. The clearness of reasoning and the results justify our determination in the eyes of all the world."

Ah! if one had known what glorious and brilliant future destiny had reserved for this young physician. The captive of Ham has become Napoleon III.! But no one can know all! Alas! no one—not even an Academician!

### Telegraphic Mutual Insurance Assessment.

We have received up to the night of July 30th, two dollars each from the following parties: J. A. Borst, J. D. Reid, W. O. Lewis, W. H. Hill, T. H. O'Reilly, John Horn, Jr., Thomas Allen, George W. Baldwin, Charles Bagley, Benj. C. Clark, E. Chapman, W. J. Dealey, S. C. Hendrickson, H. F. Makepeace, A. W. Pearke, M. S. Roberts, G. W. Shires, F. H. Zimmerman, J. U. Ansley, Andrew Smith, G. H. Grace, D. W. Edgcombe, D. D. Mallory, H. H. Ward, R. Cunningham, A. B. Chandler, Geo. S. Downes, Henrietta Dieckman, B. F. Ely, S. H. Edwards, H. C. Fardon, Hattie H. Franklin, Carrie A. Hinds, E. F. Ludwig, Thos. McBride, R. H. Morris, Warren H. Moake, M. D. O'Connor, Thos. P. Scully, A. S. Brown, N. H. Brown, W. W. Burhans, R. W. Marriott, L. H. Snow, William Cook, J. White Kelly, Leonard Read, George E. Gilliland, George S. Shepard, James T. Maxwell, James Lytle, W. W. Kelchner, Claude C. Freeman, Louis Maury, W. H. Chivis, G. Chivis, R. L. Deakers, S. Dunlap, W. Ferguson, G. W. Roberts, Gerritt Smith, B. Stephens, H. F. Thurber, F. C. Ward, O. M. Gay, D. R. Downer, A. S. Downer, J. C. Christie, J. E. Selden, M. H. Hedding, F. J. Grace, W. C. Havens, John Mauser, J. B. Page.

NOTICES have been mailed to members of the Telegraphers' Mutual Life Insurance Association, that an assessment of two dollars is due, one dollar for the heirs of Edwin A. Hall, and one for the next application. Some of these may fail to reach the parties. To such we trust this will be regarded as sufficient notice. Let remittances be promptly made. Many have already responded. Address D. R. Downer, Secretary, 145 Broadway, N. Y., or J. D. Reid, Treasurer, Box 3393, N. Y.

### Lightning Playing with Telegraph Wires.

The Oneida (N. Y.) *Dispatch* describes a singular freak of lightning during the thunder shower of July 2. Mr. Baldwin, operator of the Atlantic and Pacific telegraph office, had placed the cut-off in its position. This cut-off is a piece of coated wire eight inches long, arranged to turn the electric fluid back, so as to prevent injury to the apparatus or accident to the operator. In running across the cut-off the lightning melted the wire entirely off in the centre, leaving it hanging by the coating. A report like the discharge of a cannon accompanied the stroke, and was heard by persons several blocks off, who supposed it was an explosion in the office. The wire was coated by a covering of cotton, but strange to say, the fluid set fire to the papers hanging in contact with the wire, two feet above the cut-off, though the coating was not disturbed.

### Reduction of Charges for Cable Telegrams.

The Joint Committee of the Anglo-American and Atlantic Telegraph Company of London, with the approval of the Directors of the New York, Newfoundland and London Telegraph Company, have decided to reduce the tariff on the transmission of messages of ten words (five words additional being allowed for address, date and signature free) between Valentia, Ireland, and Planter Cove, Nova Scotia, to three pounds or fifteen dollars. The tariff on the land lines west of Planter Cove and east of Valentia will be an additional charge. The reduction is to take place on and after the first day of September, 1868.

In the House of Commons the bill providing for the purchase of all the telegraph lines in the United Kingdom by the Government was finally passed.

### A Real Self-closing Key.

The letter of Mr. Haven, below, refers to a proposal to work the wires with open instead of closed circuits, making the spring of the receiving magnet accomplish the closing of the local circuit, instead of the magnet. Of course, in that case, the key left open closes the circuit, and the usual spring keeps it so. This is essentially, under such a mode of using the current, a perfect self-closing key.

The sketch cut represents the key closed and circuit open. It is to us a new and ingenious idea. We hope in another number to publish all the plans submitted to us for self-closing keys as well as our own.

NEW YORK, JUNE 23, 1868.

J. D. Reid, Esq., Editor, &c.

DEAR SIR: In regard to my design for a self circuit closer which has come to your notice, an idea has since occurred to me which I think is an important one in its favor; namely, that its use would insure firm writing.

Some operators from nervous excitement, impatience, or other causes, are in the habit of pounding the key at times, or manipulating in such a style, that now and then a dot is lost, and complaint is made by the receiving operator that "it comes too light." We often hear this remark on the line, coupled with the request "please write firmer." This being the case, in the present partially insulated condition of air lines, what invention for reliable practical use, next to a safe-adjusting relay, would the telegrapher wish to see, or more cheerfully accept, than a key which would not fail to transmit every character as intended, no matter what manner in manipulating the operator might choose to adopt?

Some operators seem to entertain the impression, that when they write *staccato* style, that they make a firmer connection in closing the circuit, and imagine that their writing will reach the remotest station, perfectly as they *intend* it should. That this is a mistake, it is an easy matter to prove.

My reason for thinking that my design will insure firm writing is from the fact that the key lever closes the *main* circuit in making the back stroke which must be a steady movement, when governed by the action of a spring of proper tension. The operator writes on the down stroke which opens the main circuit and closes the local circuits, whilst the back stroke takes care of itself opening the local circuits and closing the main circuit firmly by the action of the spring.

If my idea, when put to a practical test, should not operate, as I now believe it would, I hope that some one will invent something to meet this want.

Yours respectfully,  
W. C. HAVEN.

At the banquet to Mr. Cyrus Field, the Duke of Argyll despatched a very friendly message to a daughter of Mr. Field, who remains at home. The young lady returned this felicitous answer:—"New York, 4 5 P. M.—I thank you most sincerely for the kind words you have spoken of my father, causing me to feel that we are friends, although our acquaintance is thus made across the sea and in a moment of time."

ASTRONOMERS tell us that the moon is drawing gradually nearer to the earth by about an inch every year. They have also discovered that the day is about one-hundredth of a second longer now than it was 20,000 years ago.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, AUGUST 1, 1868.

### The Telegraphs in Great Britain.

By the cable we are informed that the bill to authorize government to buy the property of the private telegraph lines of the kingdom has passed the House of Commons. We have desired it otherwise, and regret its consummation. Yet many things favored this result, and which will prevent any great mischief following the change.

There can be no question of the perfection to which the postal service of Great Britain has attained. It has been the fruit of long experience and study. The most executive minds have given it their care. The delivery of letters and the persistence with which parties are followed up is something wonderful and admirable. A limited territory, splendid roads, the permanency of official appointments, all aid in the perfecting of any government scheme of this nature. The post-office management of Great Britain has therefore justified this new trust. Our regret is to see that centralization of power in the Government, which proportionately weakens the influence of the citizen. The correlation of forces is not more true in physics than in political economy. Power taken from the base weakens the superstructure.

As we have said before, we shall regret any such action here. It will be a sign of decay which will give the lie to our pretensions. We deny Mr. Washburn's atrocious calumnies on the status of American Telegraphs. Even if we admitted them to be true, we should equally resist the change of management he proposes. No corrupt private enterprise can long presume on public forbearance. What legislation cannot do, competition or self-interest will. To give up private enterprises to government is to keep the nation in everlasting childhood.

### An Inducement to Insure.

The Telegraphers' Insurance Association should have been an immediate success; but, so far, has not realized the hopes of the gentlemen who founded it. After nearly a year has passed, and a fair amount of effort has been made to enlarge the membership, the number of applicants has only become 372. Had it reached 500, as it should very easily have done, and could now, if each insured person would secure one additional member, we would have been satisfied. Five hundred dollars, on an investment of one dollar and a half, is a useful sum when death enters a dwelling. It provides for all the decencies of burial, and should leave a comfortable balance, unless the pride of grief consumes it in wakes, and kid, and coaches. There should be five hundred members within a radius of one hundred miles of New York—certainly that number in the State of New York. As a measure of simple provision for the unfortunates whom death has ticketed for a speedy voyage, it should command a prompt and high minded response. Even the present sum, \$272, for such an one, will be

a great relief, and when some comrade dies, will be felt to be a timely and valuable possession.

Since the above was written, Mr. Seba B. Christie, of the Western Union Office, 145 Broadway, died of consumption, July 18, and the money on hand has been paid to his mother, whom he had appointed his heir. Mr. Christie was one of the early members of the association, and one of the most robust and healthy of any of his associates. He was a young man of excellent habits, genteel in appearance, very attentive to his duties, and had the respect of all his associates.

On the evening succeeding Mr. Christie's death, Mr. Edwin A. Hall, operator in the employ of the Atlantic and Pacific Telegraph Company, having gone upon the roof of the house where he boarded to "cool off," as he expressed it, before retiring, fell to the pavement and died during the night. It is supposed that he had fallen asleep, and unconsciously rolled himself off. Thus two deaths of members of the Association occurred within two days, the heirs of the first receiving, as agreed upon, all the contingent fund on hand. For the second an assessment has been made, which has been already freely responded to, and a number of new applicants for membership received.

We sincerely sympathize with the families of these two estimable young men. Mr. Hall was from Rochester, and his remains were conveyed there for interment. He was well known and esteemed by a large circle of friends throughout the State.

### Gen. Anson Stager.

The cherished design which we attributed to Gen. Stager to change his residence to Chicago, is one which had its inception in the suggestion of the officers of the Company, who felt the need of a strong executive authority to control the present and prospective vast interests which centre there. A population increasing with unexampled rapidity, a territory large as civilized Europe thrown open to settlement, a loud constant demand for increased facilities for communication, and the construction of new lines, required one whose executive ability, whose good judgment, whose capacity of labor, whose general popularity, should, at the great centre of this teeming growth, carry out the policy of the Company under large discretionary powers. Cleveland is too far east for such a control.

Under such a pressure, the reasons for which appealed to his own judgment, Gen. Stager has for some time designed to change his residence, although with much excusable reluctance. A beautiful home, enriched by many of the accessories of art, a large circle of friends whom he has won by his geniality and worth, a citizenship every way agreeable to him, all have pleaded against the change. Yet, in obedience to what is an evident necessity, as clear to his own perceptions of duty now, as it has long been felt by the Company, of which he is the efficient western executive, he will soon separate himself from all these ties, and make Chicago his home. We congratulate him upon the change. It will double his usefulness and simplify his cares. Made at the direct solicitation of the officers of the Company with which he has been so long connected, it is the strongest evidence which could be adduced of the confidence they repose in him, and of the high estimate in which they hold his services.

The friends of Prof. Morse have offered him the compliment of a public dinner, which will probably come off during the fall.

EUROPEAN PATENTS are obtained through the Scientific American office in Great Britain, France, Belgium, Holland, Prussia, Russia, Saxony, Austria, Bavaria, Wurtemberg, Italy, Spain, and in Provinces wherever patents are allowed.

## OFFICIAL STATEMENT.

Western Union Telegraph Company.

JUNE, 1868.

Gross receipts,	- - -	\$579,911 00
Current expenses,	- - -	353,375 50
Net profit,	- - -	\$226,535 50

The balance thus shown is \$26,000 above the estimate and \$56,000 above the balance of the same month of the preceding year. Of the causes which led to this we may speak in our next. Suffice it to say now that it is the legitimate fruit of the policy pursued of extending the lines and equalizing the tariff.

SINCE the last semi-annual report of the Western Union Telegraph Company, its bonds have advanced from 80 to 90. This shows the public appreciation of the increasing soundness of the Company. As these bonds are reduced in amount by the monthly absorption which it is the settled policy of the Company to maintain, the price of the stock will gradually advance. At present prices it yields an income of about 11 per cent. Sales have varied during the last month from 34½ to 35½. The lines never worked better, and increased attention is being given to their condition.

### Telegraphic Base Ball Clubs.

Our intelligent correspondent "Voyageur" of St. Louis, in his last letter states that the boys of the St. Louis office had organized into a club to play Base Ball, after the day's duties were over. Now this is capital and sensible. There is no livelier, healthier game, even though both shins and noses suffer now and then. We took it once square between the eyes and saw stars. But we were rather proud of the scar it left. Out with your bats, boys.

LETTERS from England all agree in representing the banquet to Mr. Field as one of the most gratifying and complete.

A COMPANY has been organized with a capital of ten millions, to purchase of the heirs of Prof. Page his rights under the late act of Congress. Bah!

THE Rev. Dr. Guthrie, the eloquent preacher of Scotland, says of his advancing years: "They say I am growing old, because my hair is silvered, and there are crows' feet upon my forehead, and my step is not so firm and elastic as of yore. But they are mistaken. That is not me. The brow is wrinkled, but that is not me. This is the house in which I live; but I am young—younger now than I ever was before."

### Executive Order No. 63.

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
July 31st, 1868.

ANSON STAGER,  
THOS. T. ECKERT,  
JOHN VAN HORNE, } General Superintendents.

All Monthly Office Accounts Current, Check and Free Message Reports, and all papers pertaining to the Auditing and Check and Free Message Departments, will hereafter be forwarded to the Auditor instead of to the Treasurer, as heretofore. The Monthly Reports and Vouchers of the District Superintendents, will also, after examination and approval by the General Superintendent, be forwarded to the Auditor.

This order involves no change in the present system of remittances to the Treasurer.

WILLIAM ORTON, President.

THE operator at Northfield, N. H., is cook for the railroad station, and, having other fish to fry, declines to receive THE JOURNAL. Most intelligent cook, adieu.

## For Tariff Bureau see Sixth Page.

## Nothing Lost.

Nothing is lost; the drop of dew  
That trembles on the leaf or flower,  
Is but exhaled, to fall anew  
In summer's thunder-shower;  
Perchance to shine within the bow  
That fronts the sun at fall of day—  
Perchance to sparkle in the flow  
Of fountains far away.

So with our deeds, for good or ill,  
They have their power, scarce understood;  
Then let us use our better will  
To make them rife with good.  
Like circles on a lake they go,  
Ring within ring, and never stay.  
Oh! that our deeds were fashioned so  
That they might bless away!

—Chambers' Journal.

## Meeting of the Board of Directors.

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 BROADWAY, NEW YORK.  
July 7, 1888.

## Extract from the Minutes.

RESOLVED, That the President be and is hereby requested to express to Major Abasa, the high appreciation of this Board of the marked ability, energy, and fidelity of his administration of the responsible and perplexing affairs of the Company in Eastern Asia, and to assure him of our increased confidence in his capacity and integrity, and of our sincere regard and best wishes for him personally.

Adopted.

O. H. PALMER, Secretary.

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York.  
July 10, 1888.

Sir: I have the pleasure to hand you herewith a copy of a Resolution which, by a unanimous vote of the Directors of this Company at their last meeting, I was directed to present to you.

In complying with the instructions of the Board, I desire to add the assurance of my hearty concurrence in their action, and my earnest wishes for the success you so eminently deserve, in whatever sphere of usefulness you may hereafter be employed.

Commending you to the confidence of good men everywhere, I am, with great respect,

Your obedient servant,

WILLIAM ORTON, President.

Major S. ABASA.

PHILA., June 10th, 1888.

DAVID BROOKS, Esq.,

DEAR SIR:—In reply to your favor, I would say that our telegraph line, connecting our counting house and our works in Montgomery County, is now working and has worked to our entire satisfaction, during this long wet weather.

It is our pleasure to recommend your insulators as being all that you claim.

Respectfully Yours,

BENJ. BULLOCK &amp; SONS.

We are pleased to learn that Charles Williams, Jr., the well known instrument maker of Boston, the burning of whose establishment we recorded a few weeks ago, has entirely restored his establishment, and is now ready for work again. With enlarged premises, new tools, and other appliances for rapid manufacture, we trust Mr. Williams may rise from his ashes to an increased and more remunerative business. He has our cordial wishes for his success.

A TELEGRAPH LINE is projected from Salt Lake City via Fort Hall and old Fort Boise to the Columbia River. This will ultimately make a short route to Vancouver's Island, connecting the British possessions directly with the main line. It will probably be built during the ensuing year.

## A Race for the Telegraph Wires.

Few persons have the slightest conception of the trouble and expenditure required to obtain possession of the telegraph wires when the "mail" arrives at either of the colonies. The arrival one Tuesday morning of the first Panama mail was the occasion of a *bona fide* and most exciting boat race. The appearance of the Raikaia had been most eagerly looked for for some days by the boats' crews employed by the *Argus* (Melbourne), and Messrs. Greville's Telegram Company, for the purpose of landing the first dispatch, and obtaining possession of the wires. The boats brought into requisition were small whale boats. In the *Argus*' boat were Green, the ex-champion, Mr. Cook (the shipping reporter of the *Sydney Morning Herald*, who is employed to land the telegrams for the *Argus*), and two others. In the service of Reuter's agents, Mr. McGregor and three able-bodied men pulled the well-known butcher's boat, Fairplay, the property of Mr. Fairplay, of this city. Both crews reached the mail outside the Heads, and boarded and procured their dispatches from her, and were towed up as far as Fort Denison. Here they let go, and a keen contest ensued, as might be anticipated, McGregor's crew being at a slight disadvantage as regards position. This, however, they lessened by degrees, and before passing Fort Macquarie were slightly in the lead. From this point the boats diverged, the *Argus* boat making for Campbell's wharf, and McGregor for the central steps at the Custom House. Thus the *Argus* crew had a much shorter distance to pull, yet both boats reached the shore within a few seconds of one another. At both points conveyances were waiting, and up the different streets both vehicles went at full gallop, and when they entered George Street, Greville's Telegram Company had a very considerable lead, and their telegrams, in consequence, gained precedence, and the messages, having been already prepared, were transmitted to Victoria, Queens, and throughout this colony. The distance pulled over by the two crews is about a mile and a quarter, and was done at a terrific pace. Both crews strained every nerve, and pulled with a determination seldom witnessed in a champion aquatic contest.—*Sydney Empire*.

AN ingenious savant informs unscientific people if the earth were shot at the sun from its present distance with its present velocity, and a telegram simultaneously sent to the solar inhabitants, they would receive the message in five minutes; the earth would be seen coming toward them after the lapse of eight minutes, and they would have nearly two months to prepare for the shock, which would be received over ten years before they heard the explosion.

## AMERICAN COMPOUND TELEGRAPH WIRE.

SUPERIOR CONDUCTIVITY,  
LIGHTNESS AND DURABILITY.

A MOST IMPORTANT INVENTION.

We would call the attention of Officers of Telegraph Companies, Telegraph Builders and Contractors, and the Public, to the new

PATENT COMPOUND TELEGRAPH LINE WIRE.

Manufactured by the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY,  
OF NEW YORK.

This Wire has already been put up on sections of several Telegraph Lines, and its merits fully tested, and the results show that it combines all the good qualities which are claimed for it, viz., Economy, Superior Conductivity, and Increased Strength, with Decreased Weights of Metal.

In its composition are used three metals, either of which is a good conductor, Steel, Copper and Tin; and the superiority of Copper as a conductor over other metals is well known, and but for its ductility rendering its permanent suspension in a pure state intact impracticable, it would have always been used exclusively as a Conductor on Telegraph Lines. By combining it with Steel the desired strength and permanence is attained, and the necessary weight of the line wires reduced two-thirds, thus obviating the necessity for using a large number of poles to the mile, and by reducing the points of contact, lessening the chances for trouble and escape of the electric fluid.

All other Line Wires must inevitably be superseded by this, and such Telegraph Companies as now adopt it will the sooner realize the advantages to be derived from its use over those whose lines are of the old rotten and rusty iron wire pattern.

STICKWELL & CO'S  
EXTRA MUCILAGE

THICK, CLEAR AND ADHESIVE

Who has not used

STICKWELL'S MUCILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the Parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding "or any other man." It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOUBS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, 8OZ. CONE, 8OZ. FLAT, 3OZ. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES

Sole Proprietor, N. Y.

## TARIFF BUREAU.

## Semi-Monthly Circular.

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
August 1, 1888.

To all Offices on W. U. Lines—

The following changes have occurred since July 1st, the date of the last Tariff Order. Please note them in your Tariff Book:

## NEW OFFICES.

Bateville, Miss., tariff same as Sardis, Miss.  
Benton, Dacotah, tariff same as North Fork, Dac.  
Clayton, Ind., tariff same as Cartersburg, Ind.  
Ft. Wallace, Ka., tariff 15 and 1 more than Monument Station, Ka.  
Miller's Landing, Mo., tariff same as Washington, Mo.  
New Market, N. H., tariff same as New Market Junction, South " " N. H., check New Market.  
Summit House, Mt. Washington, N. H., summer office, tariff same as Conway, N. H.  
Salmon Falls, N. H., tariff same as South Berwick Junction, Me., check South Berwick Junction.  
Waterville, Ka., tariff 75 and 6 more than Atchison, Ka.

## NEW OFFICES ON OTHER LINES.

Ft. Branch, Ind., Tariff 40 and 3 from Vincennes, Ind., check Vincennes.  
Greenwood, Va., 75 and 5 from Richmond, Va., check Richmond.  
Business from the following offices on the Reading and Columbia Railroad lines will hereafter leave our line at and be checked against Columbia, Pa., tariff as indicated:  
Ephrata, Pa., 35 and 3, from Columbia, Pa.  
Lititz, Pa., 25 and 2, " " "  
Manheim, Pa., 25 and 2, " " "  
Reinholds, Pa., 35 and 3.  
"Special rate" to Columbia will be used by all offices having "Special Sheet A," when computing tariff to these points.  
Hereafter rate to Mexico and Pulaski, N. Y., will be 20 and 1 from Oswego, N. Y., check Oswego.

## OFFICES CLOSED.

Tuscola, Ill., Ringgold, Va.

## GENERAL INFORMATION.

All offices having "Special sheet A," will use the "special rate" to Troy when computing tariff to Lansingburgh, N. Y., check Jeffersonville and New Albany, Ind., at 25 cents more than "special rate" to Louisville, Ky., Fonda, N. Y., same as "special rate" to Fort Plain, New York, and Frederick, Md., unless you have been otherwise ordered, at old rate. They will also use the old rate to Columbia, Pa., as tariff to Marietta, Pa., instead of "special rate" as directed in last JOURNAL.

The tariff to White Haven, Pa., will hereafter be same as Wilkesbarre, Pa.

Messages for Dixmont Hospital, Pa., are delivered from Allegheny City; delivery charges, 75 cents.

Business for Unionville, N. Y., in last JOURNAL, will be checked to Erie, Ky. line, instead of Middletown, N. Y. See last JOURNAL.

WILLIAM ORTON,  
President.

## SAD AFFAIR—TELEGRAPH OPERATOR KILLED.—

Intelligence was received here yesterday afternoon that A. E. Hall, son of our former townsman Thomas Hall, who was paymaster on the Central Railroad, was killed the previous night in New York City. Deceased was a telegraph operator in the A. and P. Telegraph Company's office, aged 24 years, and on going off duty, as had been his custom and that of the other operators during this hot weather, repaired to the roof of the building to sleep. About one o'clock, as is supposed, he rolled off the roof and fell to the pavement, a distance of thirty or forty feet, and was killed. His body was found about 4 o'clock. His remains will arrive here to-morrow morning, and thence be taken to Bloomfield, where his father resides, for interment.

Young Hall was one of the most expert operators in the country. At the time of his death he was employed in the Gold Board office of the A. & P. Co. Mr. Butler, operator in the W. U. office in this city, furnishes the following details of the accident: Hall fell from the roof of his boarding house. The weather was very warm, and he remarked to his roommates that he would go on the roof and cool off before he went to bed. That was the last seen of him until his body was found.—*Rock. Union.*

## Thrilling Contrast.

A painter once met a beautiful child. So enraptured was he with its countenance and expression of loveliness that he resolved to paint it. He did so, and hung his favorite picture in his study. He made it his guardian angel. In sorrow and passion he sought relief and tranquility in gazing upon that countenance. He purposed that if he ever saw its opposite he would paint that also. But years passed away before he found a face so infernally ugly as to satisfy his idea of a perfect contrast to his darling picture. It was that of a wretch lying in despair upon the floor of his cell. He painted that terrible countenance. But what must have been his emotions when he learned that it was the same person he had painted before? The first was the face of the innocent child; the last, that of the reckless, ruined youth. The best things perverted become the worst. The sweetest juices, changed, become the sharpest acids. The little angel's likeness had been metamorphosed into that of the fiend.

## California Pine.

An exhaustless source of wealth, now inaccessible, is the immense forests of sugar pine which extend hundreds of miles through the State of California on the mountain range. The proprietor of a lumber mill in Mariposa County has examined carefully a tract of 1,000 acres of this pine, where the trees range from three to twelve feet in diameter, and generally rise from 100 to 125 feet to the first limb. A belt of this timber extends at least three hundred miles parallel to the coast, no part of it above or below a certain altitude. It is reserved for the wants of future generations, but the subject of propagating this pine in all congenial situations is engaging the attention of parties on the Pacific coast.

## A Race Anterior to Our Own.

The late Sir David Brewster, in his very interesting work entitled "More Worlds than One," in discussing the geological condition of the earth, inquires, "But who can tell what sleeps beyond? If we have followed the omnipotent arm into the infinity of space, may we not trace it under our feet in remoter times, and in deeper cemeteries? Another creation may lie beneath the earth's granite pavements—more glorious creatures may be entombed there. The mortal coils of beings more lovely, more pure, more divine, than man, may yet read to us the humbling lesson that we have not been the first, and may not be the last of an intellectual race."

ONE peculiar feature of Lima life, says a correspondent, is the employment of large, clean-looking dogs in the capacity of errand dogs, and for the conveyance of small parcels. The dogs are often accompanied by a small boy, and are fitted out with panniers of leather or wicker, fastened to each side, in the same manner as the donkeys are loaded. These dogs are hired out by their owners, and are mostly employed by the small trimmings stores, although I have seen them employed by butchers and also by bakers, to carry fresh bread or meat every morning to customers. They are said to be very excellent servants, and they go trotting about the streets very sagacious and dignified in demeanor.

MR. CYRUS FIELD last week mentioned some important facts at the recent meeting of the Atlantic Telegraph Company, illustrative of the beneficial effect which a reduction in the tariff of the Atlantic cable has had upon the receipts. Under the £25 tariff the receipts were £505 per day; under the £10 they were £579; and under the five guineas £693. He stated that the company was in a position to do six times the amount of business it is now doing, without adding a shilling to the expense.

## Venom of Toads.

The Toad, formerly considered as a creature to be feared, does in reality possess a venom capable of killing certain animals and injuring man. This poison is not, as is generally thought, secreted by the mouth: it is a sort of epidemic cutaneous secretion, which acts powerfully if the skin be abraded at the time of contact. Dogs which bite toads, soon give voice to howls of pain. On examination it is found that the palate and tongue are swollen, and a viscous mucus is exuded. Smaller animals coming under the influence of the venom undergo true narcotic poisoning, soon followed by convulsions and death. Experiments made by MM. Gratiolet, Cloez, and Vulpian, show that the matter exuding from the parotid region of the toad becomes poisonous when introduced into the tissues. A tortoise of the species *Testudo Mauritanica*, lamed in the hind foot, was completely paralyzed at the end of fifteen days; and the paralysis lasted during several months. Some savages in South America use the acid fluid of the cutaneous glands of the toad instead of the curara. The venom exists in somewhat large quantities on the toad's back. Heated with ether, it dissolves, leaving a residuum: the evaporated solution exhibits oleaginous granules. The residuum contains a toxic powder sufficiently strong, even after complete desiccation, to kill a small bird.—*British Medical Journal.*

## The Alkaline Dewa of the West.

The correspondent of the Chicago *Tribune* writes of the country west of Laramie, on the Pacific Railroad:

From Laramie to here the country is very miserable and very curious. Here and there a patch of Buffalo grass may be seen, but rarely anything except sage brush and cactus. The ground seems incapable of producing anything else. The banks of all the small streams glisten with white where the alkali water has evaporated. Almost all the small streams here are impregnated with this alkali. It renders the water almost useless for all practical purposes, but it produces some very queer effects, as the workmen on the road and the visitors can testify. If one drinks much of it the same effect is produced as if a strong dose of salts is taken. This greatly disgusted the workmen when they were forced to drink it. Nor can the water be used in the engines with any effect: the steam it makes has no power. The water expends itself in froth and suds, and it eats and corrodes the boiler. This has been a great source of annoyance, and is one of the worst obstacles that the road has to overcome. Another peculiarity of this water is the effect it produces on the skin of those who wash in it; it roughens the skin of the hands, just as a cold wind chaps it in winter. It also peels the skin from the face, so that a person who uses this water has a new skin about every seven days. This is especially the case where soap is used in washing. The graders west of here, where the alkali in the water is much stronger, say that when soap is wanted for washing clothes, &c., they put some grease in the alkali water, stir it up with a stick, and there is soap. Naturally it costs but little, and when freights are reduced on the road it is proposed to supply the whole United States with cheap and good soap. Unfortunately there is no demand for that article among the Indians, and the Great Western Soap Factory cannot be started at present. As it is, every man is his own soap-maker. The result of this bad water has been to force the railroad company to dig deep wells along the line of this road. But even this is not always satisfactory; the well at Wyoming, fifteen miles west of Laramie, is almost useless on account of the alkali. In some places along the road the country is almost completely covered with the low, thick sage brush, useless for anything, except in some places where the wood is so large that it can be burned. In this region, where the land happens to be free from the sage brush, it is often so impregnated with the alkali that for two or three inches down the earth crumbles and sinks beneath the feet like ashes. Every now and then there are found in this region drifts of fossils of fish, oysters, clams, &c., thrown up from the bottom of the sea quite a time ago. Some of these fish are so well preserved that the glitter of the gold and silver on their scales is almost as bright as ever. The oysters and clams are tremendous in size, and would well do for the giants of the olden days. Some of the snakes are quite large in size, but few of them are perfect. Some of them are found imbedded in red sandstone, while others lie loose in the earth. Along with these are to be found many sea shells of various kinds. In some cases the fish will be found split open, and all the bones perfectly preserved. Some of these drifts are on the tops of bluffs, while others are low down.

## Telegraphers'

## Mutual Life Insurance Association.

## INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, falling to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

J. D. REID, Treasurer.

## DIRECTIONS TO APPLICANTS.

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage: and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

**L. G. TILLOTSON & Co.,**  
11 DEY STREET, NEW YORK.  
MANUFACTURERS OF  
TELEGRAPH INSTRUMENTS  
AND  
MATERIALS OF EVERY DESCRIPTION.

We invite all Telegraphers to a close inspection of our Work.

**WE ARE PREPARED TO CONTRACT FOR THE ENTIRE CONSTRUCTION OR EQUIPMENT OF TELEGRAPH LINES OF ANY EXTENT DESIRED.**

**OUR WORK WILL BE DONE PROMPTLY,**

And it is particularly requested that any goods sold and recommended by us, not proving satisfactory, SHALL BE RETURNED.

We have on hand an assortment of other makers' Instruments besides our own, and are prepared to supply them at their own prices—

**BRADLEY'S, CLARK'S, HALL'S, WILLIAMS'**

Or any other, excepting such as we know to be of inferior quality.

**OGDEN'S IMPROVED CARBONS**  
WITH THE  
**IMMERSED PLATINUM CONNECTION,**

Make, beyond question, the most perfect Battery yet produced. We have abundant testimony of their GREAT SUPERIORITY OVER ANY OTHER.

We particularly invite attention to our whole arrangement of the  
**CARBON BATTERY,**

Proving, as it does, that as much strength may be obtained from this Battery as the Grove, with far less expense.

**D. L. BRADLEY,**  
No. 7 EXCHANGE PLACE, JERSEY CITY, N. J.,  
Keeps constantly on hand and for sale his  
**IMPROVED TELEGRAPH INSTRUMENTS,**

Having adopted the use of  
**OREIDE METAL,**  
which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed.  
His Relays were awarded  
**THE FIRST PREMIUM**  
at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them. Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the *Achz*, which was patented August 18, 1885. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

**PRICES.**

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	18 00
Main Sounders same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	23 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office order, in which case he will make no charge for package.  
He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers' prices.

**THE BROOKS'**  
PATENT PARAFFINE INSULATOR WORKS,  
No. 22 SOUTH TWENTY-FIRST STREET,  
PHILADELPHIA.

All varieties of INSULATORS manufactured at these Works are warranted to excel the usual style of Glass and Rubber more than one hundred fold. In view of the error and delay in transmission, waste and consumption of battery material, the results of defective insulation, its fragile nature and expense of renewal, nothing is more manifest than its economy.

To RAILROAD COMPANIES relying upon the efficiency of their telegraph departments it is of great value.

JOHN POLHEMUS, Printer and Stationer, 102 Nassau St., N. Y.

OF THE TEL

VOL. I.

*By J. D. Caton.*

Now there came a lull in the babbling half of the immense crowd, and the faint murmurs of many voices died away over the lake in a whisper which struck the opposite shore and shivered the foliage like a September gust of wind. There was a long quiet, however, while many a Harvard man's heart fainted in his bosom, and every Harvard girl blushed to the temple. The blue ribbons waved softly in the soft breeze coming across the lake, and the rain began to drizzle with a little more effect upon the water-proof cloaks: "Hush! what is that!" and a report of a pistol is heard, and while the smoke floats upwards in spiral wreaths at the lower end of the lake from the judges' stake boat, a shout is heard from the crowd, and a narrow, long cigar-shaped thing lying in the water and scarcely making any eddy or swell, darts out from beneath an arch in the causeway, filled with six powerfully-built young fellows, naked as to the arms and neck, and only covered on the chest by a thin white flannel shirt. They pull around the stake boat preparatory to taking position, and are hailed with loud acclaim. This is the Yale crew, as I can tell by the shouts of "Yale," "Yale," "Yale," "Elihu Yale," from the stout-hearted blue ribbons. The Yale boys pull around and swing in near the stake boat, and get more cheers. Then there is another short wait, and from under the same causeway arch darts another long, low, narrow boat, perhaps a foot wide and forty feet long; and now I know this is old Harvard herself, with her six brave handsome champions, for there are thunderous shouts all over the lake, splitting the foliage, of "Harvard!" "Rah!" "Rah!" "Rah!" "Rah!" "Rah!" "Rah!" "Rah!" "Rah!" "Rah!" "Rah!" "I never saw such enthusiasm before as was displayed by the red-ribboned ones at the appearance of the crew. Another pistol shot.

"By jimminy cricket," said a pious man, "they are off! They are off as sure as you live." And off they had gone like an arrow from a bow or the plunge of a diver.

Now, Yale, strain your sinews, and Harvard do your best, for this will be the hardest University race ever pulled in America, and ten thousand bright eyes are beaming on you, and ten thousand soft cheeks are glowing with pleasurable pride as your oars strike the water. Yes, there she is, right above in the bushes, more rosy than a pink-tipped shell, taking all hearts by her delicious smiles and glances with her playful eyes, waving her tiny hand and thrilling ten thousand male eyes by her unequalled loveliness. Happy is the man in either crew who shall be guerdoned by her hand to-day.

"Harvard is ahead!" "Harvard is ahead!" cry a thousand throats; and Harvard is ahead, and forges up to the grand stand, the crew bending to the spoons like machinery and leaping forward to every stroke, like hounds from a throng of leather. Yale has a bigger bodied crew, and her boat lies lower in the water, while the men give forth the same steady all-sufficient stroke. "Do you see that Harvard stroke? Oh, what a nice stroke!" says Molineaux, the colored gymnast of Harvard, to me, as the red handkerchiefs of Harvard pass by my sight, with Yale growing less and less by degrees in her wake. Ho! the Harvard crew now begin to show their skill and magnificent training by the way they pull ahead of the Yale crew, who do not cease in their assiduity, neither do they play; but alas for them, Harvard is pulling forty-six strokes a minute and Yale doing her best at thirty-eight. Harvard spurts now and then, but there is no spurt in Yale, for they are doing their best and can do no more. That glorious fellow in the Harvard bow is doing wonders; his laughing, merry face, and his magnificent body are in unison with his active brain; this is mere child's play for him, and I believe he could do it all day without wear and tear. "Bravo! Bravo! George Haldredge!" shout the Harvard fellows from the shore, and half a dozen red ribbons embraced each other in the wildest frenzy, while the girls in the gallery wave their handkerchiefs and actually cry out.

"Rah!" "Rah!" "Rah!" "Rah!" "Rah!" "Rah!" "Harvard!" "Harvard!" "Oh, this is the biggest thing I ever saw," shouts a strapping, big framed fellow. Six more red-ribboned hats embrace and kick each other in the shins for sheer joy. Now the crews are almost out of sight above Regatta Point, the Harvards four boat-lengths ahead, pulling that same quick stroke for which they have become famous and feared, just dipping their oars in the water, creating no swell whatever, and keeping their boat well up out of the water, by which they save themselves much trouble, while the Yale fellows pull very vindictively and dipping their oars too deep and letting them lay too long in the water. It is no use for George Drew to throw out those massive arms like an enraged tiger; it is no use for Bill Lee, the man from Chicago, to pull out his heartstrings; no use for Roderic Terry to throw his whole soul into that bawling oar which he clutches with the grasp of a vice. The battle is almost lost and won now. The Harvard men are uproarious and shout and caper and offer two to one, three to one, four to one, anything to nothing for a bet, while the ladies rise *en masse* and wave handkerchiefs, and the New York betting men carefully put away large rolls of greenbacks in their pockets, chagrined that they cannot get a cent on the race. "Yale, Yale, Yale!" shouts a man from New Haven in sheer disgust. "Yes," says another Yale man, "shout like hell, anyhow, even if we do get beat bad." A few minutes elapses and the prows of the boats appear rounding Regatta Point, and now the excitement is positively fearful. I never before knew such an uproar. I can

just see Parry, the Yale stroke, looking as if he was about to die in his boat, and Copp's and Bucklin's eyes are almost blinded with perspiration and glamour. Haldredge is still swinging that most fearful of oars; and Loring, with his long, lean body, stretches out his arms like a hawk about to pounce upon a dove; Simonds, with his handsome face and ox-like shoulders, is pulling all he knows, and that is a good deal; while McBurney works nervously but quickly, and every man in the Harvard boat laying down to it as if an empire was at stake. Now the bands burst forth in triumphant brazen strains, that drown everything but the tremendous cheers for Harvard by sympathizers, and the short, sharp, nervous yell, "Rah!" "Rah!" "Rahes!" of the red ribbons.

The two boats pass the grand stand rapidly, Harvard leading two hundred yards, and the grand stand rages and boils and surges to and fro like a convulsed sea. Along they go by the stake-boat, both crews sweating like mules, and everybody cheering. Five minutes more and Harvard, with a great splash of her six oars, lay to it in the water by the stake-line. There is another rending shout, and as I look around and over the lake I can see the Yale boat a quarter of a mile behind, and once more Harvard wins the University race by her magnificent skill and training. The people shout as if demons possessed them, and with a final yell the Worcester regatta of 1868 is a thing of the past, to be remembered in all time by Harvard, and to be sulked over by defeated Yale.

#### Sir Curtis Lampson.

From the incipency of the Atlantic Telegraph enterprise, Sir Curtis Lampson has been one of its principal capitalists and supporters. When others, on the failure of the undertaking in 1858, hastened to sell their stock at any sacrifice, he held on steadily to his. He called together the disappointed shareholders, encouraged the faint-hearted, combatted the despairing, invited the aid of experts and scientific men, advanced large sums of money to sustain the sinking credit of the Company, made his counting-room the rendezvous of the disheartened Directors, and encouraged new efforts by still larger subscriptions of money. To no man, not even excepting Mr. Field, either in a pecuniary or moral point of view, does the success of the Atlantic cable owe as much. He was never timid. In the darkest days his faith was firm. Beyond all others he incurred risks. Failures that seemed to the public irremediable, were his incentives to new efforts. No difficulties appeared to him insuperable. Faults in construction, in paying out, and in repairing breaks in the cable; defects in signals, connections, insulation, coiling and uncoiling, became subjects of his study. The recovery of the lost cable, at attempts for which the world jeered during three years, he made his particular specialty, and to no other man is that greatest achievement of modern science as much due. His Knighthood, which is simply a decoration bestowed by the Queen as a recognition of meritorious service, neither ennobling his family nor inherited by his descendants, only stamping him, what he was all but in birth before, an Englishman, is an honor fairly deserved and nobly won. Sir Curtis Lampson is a native of Vermont.—*Correspondence N. Y. Times.*

TRIAL is being made in the office of one of the London daily papers, of a new printing machine, which is expected to transcend anything yet extant. The paper is made in immense length and delivered out from a roller. The machine is intended to print 46,000 sheets, or 23,000 perfect copies per hour, which is a greater number than has ever yet been accomplished; and it also cuts the paper into sheets, folds them, and records the number printed.

#### Opening of the First Public Railway.

Tuesday, the 27th of September, 1825, was a great day for Darlington. The proprietors of the railway met as early as six in the morning at the Brusselton fixed engine, where the working of the inclined plane was successfully rehearsed. At the foot of the incline the procession of vehicles was formed, consisting of the locomotive engine No. 1, driven by George Stephenson himself; after it six wagons loaded with coals and flour, then a covered coach containing directors and proprietors, next twenty-one coal wagons fitted up for passengers (with which they were crammed), and lastly six more wagons loaded with coals. Strange to say, a man on a horse, carrying a flag with the motto of the Company inscribed on it, "*Periculum privatim utilitas publica*," headed the procession. A lithographic view of the great event, published shortly after, duly exhibits the horseman and his flag. It was not thought so dangerous a place after all. The locomotive was only supposed to be able to go at the rate of from four to six miles an hour; and an ordinary horse could easily keep ahead of that. Off started the procession with the horseman at its head. A great concourse of people stood along the line. Many of them tried to accompany the train by running, and some gentlemen on horseback galloped across the fields to keep up with it. The railway descending with a gentle incline toward Darlington, the rate of speed was consequently variable. At a favorable part of the road Stephenson determined to try the speed of the engine, and he called upon the horseman with the flag to get out of the way! Most probably, deeming it unnecessary to carry his *periculum privatim* further, the horseman turned aside and Stephenson "put on the steam." The speed was at once raised to twelve miles an hour, and at a favorable part of the road, to fifteen. The runners on foot, the gentlemen on horseback, and the horseman with the flag, were consequently left far behind. When the train reached Darlington, it was found that 450 passengers occupied the wagons, and that the load of men, coals and merchandise amounted to about 50 tons. At Darlington the procession was rearranged. The six loaded coal wagons were left behind, and other wagons were taken on with 150 more passengers, together with a band of music. The train then started for Stockton, a distance of only twelve miles, which was reached in about three hours.—*Smiles's Lives of the Stephensons—new edition.*

#### Aurora Works the Telegraph.

During the recent displays of the magnetic storm, or Aurora Borealis, which was an object of wonder and admiration, the telegraph operators at Valparaiso and Fort Wayne, Indiana, curious to test its effect in working telegraph lines, disconnected the batteries from the line and put in ground wires, when they got magnetism sufficient enough to work the instruments quite well, enabling them to communicate with each other.

A FRENCH chemist informs the Academy of Sciences that he has discovered a means of fabricating real diamonds. His process consists in vaporizing molten iron, and condensing the vapor in a peculiar manner, when, as he says, the diamond *ought to be* one of the products of the condensation. If a current of chlorine, he says, be made to pass through cast iron when in a state of fusion, perchloride of iron is formed, which disappears by evaporation, leaving the carbon of the metal at liberty, in a crystallized state. He does not say whether he has actually made a jewel; but M. Dumas, the Secretary of the Academy, says that the experiment is worth trying; whereupon, *Once a Week* facetiously adds: "The experiment will begin with vapor, so there is just the possibility of its ending in smoke."

## Tyndall and Varley in a New Role.

From the *Spiritual Magazine*."FLEETWOOD HOUSE, BECKENHAM, {  
"19th May, 1868. }

"J. Tyndall, Esq., F. R. S., &amp;c.

"MY DEAR SIR:—Mr. Wallace has forwarded me your letter to him, dated 7th inst.

"In compliance with your desire, I will endeavor to describe briefly some of the 'physical phenomena' I saw on two occasions, in the presence of Mr. Home, together with the precautions I adopted to guard against trickery. To facilitate the explanation, permit me to premise, that the object of the *seance* was to demonstrate to me that the physical manifestations were not the result of trickery, and that there was some other intelligence at work besides Mr. Home and the observers. I had repeatedly heard from well-informed people of extraordinary manifestations occurring in the presence of this much-abused gentleman, and became very anxious to ascertain for myself the nature of them.

"Having no introduction, I called one Tuesday morning in the Spring of 1860, at his residence, 134 Sloane street, and told him that I was an Electrician of the Electric and International and the Atlantic Telegraph Companies, that I was well acquainted with electricity, magnetism and other physical forces—that I had heard of extraordinary phenomena occurring in his presence, and was desirous of seeing them and of investigating their cause. I asked him if he would permit me to witness them. His answer was 'He would be delighted to do so.' At the same time he warned me that he could not promise that any manifestations would take place, that the phenomena were of a delicate character, and that it generally required several sittings before the necessary rapport was established to permit of anything decisive.

"The next day I received a formal invitation for myself and Mrs. Varley for Thursday evening, between seven and eight o'clock. Mr. Home was residing in furnished apartments, and the drawing room into which I was introduced on the Tuesday, and in which the phenomena occurred on the Thursday, was over a chemist's shop.

"On one of those occasions, I examined the staircase to see if the floor was of unusual thickness or not, so as to permit of the introduction of machinery, and I also went into the shop underneath and examined the ceiling under the drawing room, but there was nothing unusual. The room was rather scantily furnished; there was a couch, about a dozen chairs, and nothing else capable of concealing any quantity of apparatus.

"Eight of us sat down to a large, heavy, circular table. I had previously arranged with Mrs. Varley to observe very closely, to look out keenly for anything resembling trickery, to observe the room, the furniture and those present for anything that might appear suspicious, and if anything unusual happened to note it carefully and fix it in her memory, so that we might collate our observations. On a slip accompanying this I give you in confidence the names of those who were present, all excepting one whose name I do not recollect, and their positions around the table. Finding so many ladies I felt some disappointment, fearing it would prevent a rigid scrutiny.

"The lady who sat on Mr. Home's left, *i. e.* between me and him (and whom I will call Mrs. A.), and who had devoted considerable attention to the subject, entreated me, as did Mr. Home, to use my utmost endeavors to satisfy myself with regard to the phenomena, and he again urged me on no account of etiquette or otherwise to hesitate to make a complete scrutiny.

"I availed myself of this. After sitting at the table for twenty minutes the first phenomenon occurred. We heard a number of sounds or raps as they are frequently termed. I examined the table underneath while Mrs. Varley observed above. There were four full-sized gas burners in the room burning brightly, all hands were on the table, all feet, as previously desired by Mr. Home, were turned back under the chairs.

The following simple telegraphic alphabet was then explained to me:

1 sound or movement, or action of any kind	No.
8 sounds	Yes.
3 sounds	Doubtful.

*i. e.* that neither No nor Yes would answer the question.

5 sounds or movements, &c., of any kind, the *Alphabet*.

*i. e.* that the *alphabet* was to be run over or repeated aloud, and on the right letter being reached the fact was indicated by three sounds. In this manner words could be telegraphed easily, though slowly, by any one capable of producing the signals in question. Mrs. A. audibly expressed a wish that I should be touched—immediately five sounds were heard and telegraphing commenced. We were informed by this means that the communicator was afraid to approach me. I made no remark, but simply kept a sharp look-out, and endeavored to find whence the sounds proceeded. Shortly after, the table tipped up, first on one side and then on the other, remaining sometimes for many seconds in an inclined position, having described an arc of about 30 degrees. I examined under and over the table—all hands were resting gently on it, and I could see no indication whatever, of any exertion of muscular force on the part of any of us. About this time the sounds became louder, and there were two distinct kinds of raps—the one being a lower, but louder note than the other. The lighter and higher sound communicated that it had now lost its dread of me, and would move my coat. It was pulled or jerked three times—about half

a second of time elapsing between each pull. As these jerks were given to my coat, low down on the right hand side, between my chair and that of Mrs. A., the thought flashed through my mind, that this could not be accepted as evidence; but that, if my coat were pulled above the table, so that I could see it, it would be far more satisfactory. The instant this thought had passed through my mind, the flap of my coat on the right-hand side, within a foot of my face, was turned up three times. Immediately, and in order to test it carefully, I *mentally* wished the left hand cellar to move in a similar manner. Before the thought had been put into words in my own mind, the left-hand flap moved three times, as requested.

"Very shortly afterwards information was signalled that I should be touched on the knee: without moving I again inaudibly desired that my right knee should be touched three times, and instantly I felt three distinct pressures. I mentally said, 'Left knee,' and it was touched three times without waiting a second. I mentally said, 'Right shoulder,' and it was instantly touched, but I could see nothing. I then mentally said, 'Left shoulder,' and finally, 'Top of my head,' and was touched accordingly three times at each place. The whole occupying not more than three times at each place. The whole occupying not more than 10 seconds. As I did not speak or move, or make any gesture, no one was aware of what had taken place until I described it to them. The table was tilted about a great many times, and by means of the signals we were instructed to stand up, which we did, resting our hands lightly on the table, the latter after rocking about for a little while suddenly rose up bodily off the floor 14 or 15 inches, moved about, and then descended. I examined underneath during this phenomenon, but there was nothing visible. The hands were well over the table, and it certainly was not supported by them. It then occurred to me, as my *unuttered* thoughts had been responded to in the early phenomena, that if the table rose off the floor again I would wish it to be moved in various directions; after writing three or four minutes the table rose again into the air about 12 or 15 inches and remained up fully half a minute. I mentally wished it to move in various directions, and it did so, before those thoughts had assumed the shape of words in my own mind.

"During a portion of the *seance*, as many as four distinct kind of raps were heard at the same time, and as many people were putting questions and receiving answers at the same moment. When requested, the raps were produced on the walls, on the ceiling, on our chairs, which latter were distinctly shaken by them: and on several occasions the whole vibrated sufficiently to simultaneously attract the attention of every one.

"Several of us, while seated in our chairs, were suddenly twisted round; and subsequent experiment showed that it required a good vigorous effort to perform a like operation by the hands. These twistings occurred to those who were far from, as well as those who were near to Mr. Home. The *seance* continued till about eleven o'clock; Mr. and Mrs. Home, as well as Mrs. A., pronounced it unusually successful, and expressed surprise at such a display of force at my first investigation.

"On returning home Mrs. Varley and I compared notes. I found that she had put a great many questions mentally and received answers as rapidly as I had.

"It was between 12 and 1 o'clock when we reached our dwelling at the other end of London, five or six miles from Sloane street. Before retiring I requested Mrs. Varley to sit down with me in the drawing room and once more think over carefully what we had seen together with the tests we had employed to guard against delusions: while so engaged, although five miles away from the medium, the sounds or raps commenced upon the walls of our own house.

"The next evening I received a letter from Mr. Home, in which he informed us of the fact that we had heard these sounds in our own house.

"I saw him shortly afterwards and asked him how he knew this, and he said that the same power which had produced the phenomena at his house, had produced the sounds in my own room, and had informed him of the fact and instructed him to write me as an additional evidence.

"SECOND SEANCE AT MY OWN HOUSE, AT BECKENHAM, KENT.

"Present:—D. D. Home, a lady, a city accountant, a merchant, a gentleman, the first officer of a ship, Mrs. Varley, and myself.

"I purchased this house in the latter part of 1863, while it was in course of erection, and before any of the flooring was laid; I am therefore well acquainted with its internal structure.

"In the summer of 1864, I requested Mr. Home to keep his promise of giving me a *seance* at my own house, and I invited the people mentioned to meet him. He had never been in the house before.

"We had a great many phenomena similar to those already described: there were some, however, different from those I had seen in his house. During the course of the evening he became apparently nervous, and requested me to hold his hands, and said: 'Oh! look behind you'—and became somewhat alarmed.

"He then put both his legs over my left knee, and at his request I held both his legs between my legs, and grasped both his hands in my own. We all of us looked in the direction which he indicated—there was a small side table close to the conservatory window, seven feet behind Mr. Home's back, Mr. Home and I being the nearest to it. We were seated thus:

"Shortly afterwards the side table began to move. This table is mounted on casters, and it was driven up to me by some invisible means no one being near it, and while I had hold of both Mr. Home's hands and legs. A large ottoman, capable of seating eight persons, was moved all over the room, and we were all driven by it up to the piano-forte.

"*Imposture* was impossible. Phenomena of this kind were abundant this evening. As many of them occurred in the dusk of the evening they hardly come within the scope of your demand, *viz.* under a 'bright light.' I have witnessed the 'physical phenomena' more than twenty times; but the higher physical phenomena, which convey better proof to those who actually witness them than do the physical, have been witnessed by me more than a hundred times both in England and America.

"You may ask why I have not published this before. The answer is simple—you yourself know how all new things are received in this world of contention.

"I have endeavored, whenever opportunity, health, and business would permit, to ascertain the nature of the force by which these phenomena are produced, but I have not progressed much farther at present than to find out the source whence the physical power is abstracted, *viz.* from the vital systems of those who are present, and especially from the medium. The part of the subject under discussion, therefore, is not yet ripe for publication.

"As to the phenomena themselves, there are numerous accounts on record—some excellently authenticated, both in this and the previous century. We are only now re-studying what has been investigated by the philosophers who lived 2,000 years ago; and when some good Greek or Latin scholar, who has made himself acquainted with the character of the phenomena which have been presenting themselves so numerously since the year 1848, will properly translate the writings of those great men, the world will find out that what is happening at the present time is only a new edition of an old page of history, studied by keen intelligences to an extent that will redound greatly to the credit of those good and clear-headed old sages, who seem to have risen far above the narrow-minded prejudices of their age, and to have investigated the matter under discussion to an extent in some respects transcending our present knowledge.

"I am, my dear Sir, very truly yours,  
" (Signed) CROMWELL F. VARLEY.

## The Invention of Vulcanized Rubber.

After long years of effort and disappointment, Charles Goodyear stood apparently as far as ever from the attainment of his object, until one day, while in earnest conversation regarding his proposed invention, he emphasized an assertion by flinging away at random a piece of rubber combined with sulphur that he held in his hand. The fragment fell upon the stove, was subject to a higher heat than that to which he ever ventured designedly to subject the material; and when it was recovered it was found to possess the qualities for which he had sought so long; cold did not harden and heat did not soften the water-proof and elastic mass. And thus sprang forth the germ of an invention that has built up a new branch of manufacturing industry, given employment to thousands of operatives, and added in myriad forms to the conveniences of life.—*Am. Art.*

We appointed, some 16 years ago, a quick active lad, named Matthew Hunt, to a messengership in the Louisville, Ky., office. A day or two ago he called on us, still young, still active, but now a St. Louis merchant, doing a large and growing business, trusted and honored, as all true men are. We like to see these boys dropping into this quiet corner of ours, to tell us how the world uses them. Success to all of them.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month commencing with December 1, 1887. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, AUGUST 15, 1888.

### The Bewildered Stockholder.

A few days ago we watched an elderly gentleman, with a hat so ancient and so smoothly brushed as to suggest habits alike of neatness and economy, studiously conning the recent exhibit of the Western Union Telegraph Company. With his right shoulder against the glass of the street door, the forefinger of his right hand between his teeth undergoing the progress of a gentle chew, and with his left holding the JOURNAL OF THE TELEGRAPH, his whole attitude denoted intense interest and study. Just as we were turning aside, the old gentleman suddenly cocked his head on one side, changed the point of chew from the first to the upper joint of his salivated digit, and with his left eye partly closed and the brother optic gleaming beneath the sharp arch of his elevated eyebrow, looked the very personification of an algebraic puzzle. By and by, however, his features relaxed, and resignation, if not contentment remained behind. Yet there was evidently something still resting in his mind undigested.

Observing, we presume, something communicative in our always pleasant features, the owner of the hat and finger, sideling up to us with a kind of cat-like carefulness which was entirely unnecessary and somewhat amusing, asked in a half-pronounced and furtive manner:

"Belong to this Company?"

"Yes, sir."

"President in?"

"Believe he is. Do you want to see him?"

"Well, yes, I want to know some things about this Company I can't understand."

"Perhaps I can relieve your mind, sir. What is the trouble?"

"Well, you see," and the old hat looked like the knob of a mark of interrogation, "this item of construction, construction always coming into these statements after a line has been built clear over the whole way from Calais to San Francisco I don't understand, and," waxing a little warm and the hat looking pugilistic, "I don't believe. There's money enough spent for construction to make my stock worth par and my dividends six per cent., sir."

"Well, my dear sir, don't get angry. Construction and Re-construction, you know, are both troublesome things to understand. But both are necessary. Now listen a moment:"

"The territory of the Western Union Telegraph Company is under three general Superintendents, all of them first-class, practical men, and it is their business at the beginning of every year to make an estimate of what they need and the amount of new line which ought to be or must be built."

"Must, must," sharply retorted the old hat, "what business have they to 'must.' Is, is, isn't the line built already, or is there any line at all? Tell me that, sir," and the brim of the hat and the two mobile lips made signals to each other in a most alarming way.

"Now, now, now don't be impatient, and listen: In one of these divisions, 37 railroad companies have determined to extend their roads 3,485 miles during the coming year. They have telegraph lines along their present roads, but need them wherever their roads run. They cannot do without them. If we don't build lines for them, some one else will. It won't do to let other lines cover our territory, you know. Don't you see? That's what makes the Company strong and useful."

The old hat muttered the word "useful" as if it was a silly thought, but rather stiffened up on the "strong," and asked with considerable calmness—"are you going to build all them lines this year for these railroads?"

"Well, we must build some of them, if not all, and there's a good deal more to do besides that."

"More," what 'more?' Do you mean to tell me that the other two divisions must have as many more miles of line built for them—over 10,000 miles of new line in a single year? Where's my January dividend to come from? By George, I'll sell."

"No, no, don't you sell, the dividend will be all right. But men ought to be more intimate with the necessities of this great concern. During the last four years or so, the Company has built over 25,000 miles of line. It cannot stop building. Every new town which springs up in the vast range of country opening by the Pacific Railroad must have its office. Increase of population demands new facilities. New railroads must have new lines, and reduced tariffs must, in developing new business, require added wires to enable companies to perform it. No, sir, we cannot stop construction; it is the policy of an intelligent company to place the facilities of intercourse in possession of every community everywhere, and we intend to do it."

"God bless me!" exclaimed my agitated friend—and the old hat moved out into Broadway, and was soon lost among a sea of other hats as it threaded its way to Wall street.

This "construction" item troubles many. And yet it is the visible sign of life, the basis of a successful future. The gain of \$56,000 in June is due to it. Every new line is a new rivulet opened, whose last trickle is heard in the money-drawer of the Treasurer, at 145 Broadway, New York.

### Stomachic Observations.

Some time ago we published the statement of some European genius, that he had discovered a mode by which all the operations of the stomach and bowels could be seen. Several applications were made for copies of the paper containing it, and a request from one enthusiastic correspondent to know if such a machine could be produced. A second time we had a similar announcement from Breslau, with a similar result. To see the operations of the stomach seems to be invested with remarkable charms.

Now we protest. The happiest thing in life is to be supremely unaware of the existence of a stomach at all. Carlyle said he was happier until he found he was the possessor of so diabolical a thing as he found a "stamack" to be. With a machine for watching it we would have the most unutterable unhappiness at our tables, where such machines would surely go, as the processes of the destruction of hash, and eggs, and buttered fish, and soft crabs, were going on, and watched. We should be afraid to eat. We would be jumping up at night in our disturbed gowns to see the condition of the oysters we ate at 11 P.M., and the cream we swallowed at 12. No, no; such knowledge is too wonderful. At least, let it be confined to the doctors. The least we think about stomachs the better they work. That is orthodox philosophy. We speak that which we do know. Let the stomachscopes alone.

### Telegraph Lines.

In the report upon the Universal Exposition of Paris, prepared by M. Neumann, in the name of the Austrian Commission, it is shown that the telegraphic lines of the whole world would have a total length of 47,255 geographical miles. There are in Europe 8,000 telegraph offices, and 4,000 in the other continents. No less than 1,300,000 hundred weights of metal have been used for the conducting wires, and the expenses of establishing all the lines are estimated at nearly \$42,000,000.—*Scientific Amer.*

We have only to inform M. Neumann that the Western Union Telegraph Company has as many miles of actual pole line, as he has allowed to be in existence in the whole world.

MR. WM. M. SPINK, of the Western Union Telegraph Office, St. Louis, has accepted the post of night report operator, at the office of that company in Cincinnati. Mr. S. is, besides being a skilful operator, a man of education, and uses his pen gracefully and fluently. He has contributed already several pleasant and acceptable letters to this journal, and we trust to hear from him often.

### Telegraphers' Insurance.

The following has the right ring in it. We would be glad to receive one thousand applications within thirty days. We would feel prouder of the craft:

TELEGRAPH OFFICE,  
McKENNANVILLE, Pa., August 4, 1888.

MR. J. D. REID:

Dear Sir—Enclosed please find amount assessed me on account Insurance—\$2.

Hoping all the telegraphers in the land will take hold of this mutual benefit, placed within the reach of all, binding us together in one fraternal band, and giving us the assurance that we are lightening each other's burdens, thus accomplishing one of the noblest objects of life. Yours sincerely,

S. M. G. WENCK.

### Telegraphic Insurance Association.

ASSESSMENTS RECEIVED SINCE JULY 30.

**EXECUTIVE ORDER No. 64.****Reduction of Tariff on Atlantic Cable Business.**

On and after September 1, 1868, the rates of tariff on Atlantic Cable business will be as follows:

TARIFF IN GOLD TO ANY POINT IN GREAT BRITAIN AND IRELAND.

	10 words or less.	Each additional word.
From all points in Nova Scotia and New Brunswick, except Sackville, . . .	\$16.35	\$1.63
" Sackville, N. B., . . . . .	16.10	1.61
" Boston, Mass., . . . . .	16.65	1.66
" New York City, . . . . .	16.85	1.67
" all points in Maine, New Hampshire, Vermont, Massachusetts (except Boston), Rhode Island, Connecticut, New York (except N. Y. City), New Jersey, Pennsylvania, Delaware, Maryland; and District of Columbia, . . . . .	17.35	1.72
" All points in Virginia, West Virginia, North Carolina, South Carolina, Georgia, Alabama, Mississippi, Louisiana, Tennessee, Kentucky, Ohio, Indiana, Illinois, Michigan, and Wisconsin; also, from St. Louis, Mo., and Lake City, Tallahassee and St. Marks, Fla., . . .	19.00	1.83
" All other points in Florida, . . .	22.50	2.13
" All points in Texas, Arkansas, Missouri (except St. Louis), Kansas, Nebraska, Iowa, Minnesota, Colorado, Dacotah, Wyoming, New Mexico, Utah, Idaho, Montana, Nevada, California and Arizona, . .	21.75	2.08
" All points in Oregon, Washington Territory and British Columbia, . .	24.75	2.33

We are notified of following changes in rules for Checking, Counting, etc., which otherwise remain unaltered, as per Executive Order No. 58, published in the JOURNAL OF THE TELEGRAPH, February 15, 1868.

Figures in ordinary messages must be expressed in words thus "2" two—"45" four fifths. The charge will be for the number of words and letters without regard to the figures they represent.

Count two-pence, three-pence, &c., up to eleven-pence inclusive, each one word.

Prepaid answers must be presented for transmission not later than eight days after arrival of original at delivery station. If answer of only ten words is prepaid, it is sufficient to insert in original message "reply paid."

In messages repeated back from destination to originating station, the words "repetition paid" must be inserted after address and charged for.

Code messages, constructed for purposes of secrecy, of disjointed sentences or words, rendering the meaning unintelligible, will be transmitted with every possible care, but the Telegraph Companies while willing to investigate by post, complaints respecting errors in such messages, will not return the charges upon them unless they be "repeated messages." Should the receiver of such a message have it repeated, the amount paid for application and reply will not be returned unless the message was originally a "repeated message" and paid for as such by the sender.

**TARIFF TO PLACES BEYOND GREAT BRITAIN AND IRELAND.**

On messages to places beyond Great Britain and Ireland, charge the following rates, in gold, in addition to the tariff to Great Britain and Ireland:

TABLE			
For each 10, or fraction of 10, words above 20, charge in addition, one-half of these rates.			
20 words or less.			20 words or less.

We are notified of following changes in Rules relating to Continental business:

Determine the number of chargeable words by count of actual words in the entire message, including address, date and signature, without reference to the number of letters.

All compound names and words count for as many words as they contain.

The Continental Telegraph Companies will not entertain or investigate complaints of error or delay in unrepeatable messages.

In all other respects Rules contained in Executive Order No. 58, remain unchanged.

WILLIAM ORTON, President.

**TARIFF BUREAU.****Semi-Monthly Circular.**

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
August 15, 1868.

To all Offices on W. U. Lines—

The following changes have occurred since August 1st, the date of the last Tariff Order. Please note them in your Tariff Book:

**NEW OFFICES.**

Clarendon Springs, Vt., tariff same as Rutland, Vt.  
Emblenton, Pa., tariff same as Brady's Bend, Pa.  
Gilmer, Utah, tariff same as Weber, Utah.  
Meranac, Mo., tariff same as Kirkwood, Mo.  
Templeton Depot, Mass., tariff same as Gardiner.  
Velonia, Ind., tariff same as Brownstown, Ind. (Velonia will be open during the melon season only.)  
Wheatland Furnace, Pa., tariff same as Sharon, Pa.  
Wheatland, Ind., tariff same as Vincennes, Ind.  
Newfield, N. J., summer office, tariff same as Vineland, N. J.

**OFFICES OPENED ON OTHER LINES.**

Camp Reed, Utah, tariff same as Weber, Utah. Check Weber.  
Gorham, Me., tariff 25 and 2 from Portland, Me. Check Portland.  
Pierreville, Quebec, tariff 25 and 2 from Montreal, Quebec. Check Montreal.

**OFFICES CLOSED.**

Blandensville, Ill., Zilwaukee, Mich., and Freemansburg, Pa. Business for Freemansburg will be mailed at Bethlehem Pa.

**GENERAL INFORMATION.**

The through tariff to the following named offices on the Delaware and Hudson Canal Telegraph line, is now 35 and 3 from Scranton, Pa., Rondout, N. Y., and Lackawaxen, Pa. Business will be sent by the route giving the lowest rate, and be checked accordingly. Lackawaxen is an "Erie line" office; business sent by that route will therefore be checked to the same point as is now checked on business for Lackawaxen.

Archibald, Pa. Mongaup, N. Y.  
Barryville, N. Y. Neversink, or  
Carbondale, Pa. Cuddebackville, N. Y. }  
Eddyville, N. Y. Olyphant, Pa.  
Ellenville, N. Y. Phillipsport, N. Y.  
Hawley, Pa. Pond Eddy, N. Y.  
High Falls, N. Y. Providence, Pa.  
Honesdale, Pa. Waymart, Pa.  
Kerhonkson, or White Mills Pa.  
Middleport, N. Y. Wurtsboro, N. Y.  
The name of the office heretofore known as Bolling Springs, N. J., has been changed to Rutherford Park, N. J., and Holderness, N. H., to Ashland, N. H.

WILLIAM ORTON,  
President.

PHILADELPHIA & READING RAILROAD,  
SUPERINTENDENT'S OFFICE,  
READING, June 1, 1868.

DAVID BROOKS, Esq.,

DEAR SIR:—We have in use upon the lines of this Company three different kinds of Insulators, among which is your improved Paraffine, excelling all others, both as to insulation and durability. The lines having your insulators work well during all kinds of weather.

Respectfully,  
C. T. SELLERS,  
Superintendent Telegraph.

BEST MATERIAL AND WORKMANSHIP.

The Oldest Establishment in the United States.

**AMERICAN COMPOUND TELEGRAPH WIRE.**

SUPERIOR CONDUCTIVITY,  
LIGHTNESS AND DURABILITY.

A MOST IMPORTANT INVENTION.

We would call the attention of Officers of Telegraph Companies, Telegraph Builders and Contractors, and the Public, to the new

PATENT COMPOUND TELEGRAPH LINE WIRE

Manufactured by the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY,  
OF NEW YORK.

This Wire has already been put up on sections of several Telegraph Lines, and its merits fully tested, and the results show that it combines all the good qualities which are claimed for it, viz., Economy, Superior Conductivity, and Increased Strength, with Decreased Weight of Metal.

In its composition are used three metals, either of which is a good conductor, Steel, Copper and Tin; and the superiority of Copper as a conductor over other metals is well known, and but for its ductility rendering its permanent suspension in a pure state intact impracticable, it would have always been used exclusively as a Conductor on Telegraph Lines. By combining it with Steel the desired strength and permanence is attained, and the necessary weight of the line wires reduced two-thirds, thus obviating the necessity for using a large number of poles to the mile, and by reducing the points of contact, lessening the chances for trouble and escape of the electric fluid.

All other Line Wires must inevitably be superseded by this, and such Telegraph Companies as now adopt it will the sooner realize the advantages to be derived from its use over those whose lines are of the old rotten and rusty iron wire pattern.

STICKWELL & CO'S  
EXTRA MUCILAGE

THICK, CLEAR AND ADHESIVE

Who has not used

STICKWELL'S MUCILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the Parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding or any other man. It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOURS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, 8OZ. CONE, 8OZ. FLAT, 8OZ. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES  
S. S. STAFFORD,  
Sole Proprietor, N. Y.

## What Next?

Telegraph lines and cables having had their excitement and their congratulatory suppers and gold medals, the great public maw is open for something new. We have been expecting daily to hear of some feasible proposal to receive a gentleman at some handsome New York receiving office, fasten him inside a gilded ball, duly labeled, give him a drink of Colton's ether to render him unconscious of motion for a few seconds, and blow him by pneumatic tube out on the sidewalk of Philadelphia or Washington, inside of ten seconds, with all the integuments of the blowee's raiment clean and undisturbed. We are, perhaps, not quite ready for that yet, although it is coming. But we are going to fly! Men are to become angelic in fact, and women what they are now, or are supposed to be, angels. We cut the following from "ENGINEERING," one of the two great English scientific papers. Oh! ye young maidens who want to fly into your lovers' arms, be comforted, for the day draweth nigh! You sigh

"Oh! that I had the wings of a dove."

Well you shall have them, sweetest. Mr. Spencer is making them for you. Only don't put too much steam on as you come on aerial flight with your fan-shaped terminus to

"Rest, rest in this bosom, love."

Come gently, gently, with all your cranks and appendages cool, giving due notice by proper whistle of your approach.

## THE FLYING MAN.

At the recent meeting of the Aeronautical Society, it was announced by Mr. Wenham, that one of the members of the society, Mr. Spencer, had already constructed an apparatus, by the aid of which he had accomplished the feat of raising himself from the ground level and performing a horizontal flight of sixty feet; and it was further stated by Mr. Wenham that Mr. Spencer expected to fly the length of the Crystal Palace during the meeting of the Aeronautical Society to be held there next month. Since the above announcement was made, we have received from Mr. Spencer some particulars of the apparatus employed by him. It consists of a pair of wings of rather small size, arranged so that they can be worked by the arms, and a large fan-shaped tail of very light construction, connected to the body by basket-work, so that it stands at an angle of about 8° with the horizontal. Mr. Spencer does not profess to fly in the ordinary sense of the term. He uses his apparatus by taking a short, quick run, this run being continued until, by pressure of the air against the under surface of the tail, he is raised from the ground. He then, by using the wings, maintains the momentum which he has acquired as long as possible, and is thus enabled to skim along at a short distance above the ground. Mr. Spencer commenced his operations by practicing long jumps without the aid of the apparatus, and he then commenced using the wings, and finally added the tail. By continued practice, and from time to time making alterations in his apparatus, Mr. Spencer has been enabled to extend considerably his early flights or "skims," and we were informed by him a few days ago that he had lately accomplished a flight of 180 feet, starting and alighting at the ground level. Mr. Spencer is now engaged in completing a new apparatus, which he hopes to finish in time for the exhibition of the Aeronautical Society at the Crystal Palace, and we look forward with some interest to witnessing its performance.

A CORRESPONDENT who signs himself "Above Canal Street," deems the branch offices entitled to a share of the credit given to the central office in the recent statement of business done during "Convention Week." This we cheerfully accord. The labor was all the greater from having to perform it alone.

## Petrification of the Human Body.

W. P. Bain, M. D., writes as follows to the *Lancet*, on the subject of Dr. Marini's preparation of the human body:

"Having handled some of his preparations in Florence last Autumn, I am able to say that he is the inventor of a mode of turning the human body or any part of it into stone, in any attitude that may be desired. I inclose the photograph of a senator of the Italian Parliament, taken four months after his decease, in which he is represented seated in his chair, with his clothes on, just as when alive, his eyes retaining, in an astonishing degree the vivacity of life. I also inclose the photograph of a table, the slab of which is formed of pieces of the human body—brain, muscles, etc.—all turned into stone, and which, when struck by me, sounded as a marble table. I also inspected a lady's foot, likewise petrified, and which had every appearance of marble, until upon close inspection, the texture of the skin was apparent. Dr. Marini showed me, too, some specimens of the human body, which were in a moist and perfect condition, preserved for years. He assured me also that the week before he had dined off a duck which had been killed months previously. The foot of a mummy was in his apartment at the time of my visit, in which the color assumed that of life, and the toes were perfectly flexible.

"I am perfectly certain that these inventions are genuine and of high value; and when Dr. Marini arrives here, I hope to be able to introduce him to the heads of the profession. The Emperor of the French, with his usual tact, has expressed himself warmly to Dr. Marini in approbation of his inventions.

## Stomach and Mind.

Much of our conduct depends, no doubt, upon the character of the food we eat. Perhaps, indeed, the nature of our meals governs the nature of our impulses more than we are inclined to admit, because none of us relish well the abandonment of our idea of free agency. Bonaparte attributed the loss of one of his battles to a poor dinner, which at the time disturbed his digestion. How many of our misjudgments, how many of our deliberate errors, how many of our unkindnesses, our cruelties, our acts of thoughtlessness and recklessness, may be actually owing to a cause of the same character! We eat something that deranges the condition of the system. Through the stomachic nerve that derangement immediately affects the brain. Moroseness succeeds amiability, and under its influence we do that which would shock our sensibilities at any other moment. Or perhaps a gastric irregularity is the common result of an over indulgence in wholesome food, or a moderate indulgence in unsuitable food. The liver is afflicted. In this affliction the brain sympathizes. The temper is soured, the understanding is narrowed, prejudices are strengthened, generous impulses are subdued; selfishness, originated by physical disturbances which perpetually distract the mind's attention, becomes a chronic mental disorder; the feeling of charity dies out; we live for ourselves alone, we have no care for others. And all this change of nature is the consequence of an injudicious diet.—*Journal of Chemistry*.

## A Sure Sign of Death.

M. Martenot de Cordoux, of the Lyons Military Hospital, states the following as an infallible means of deciding on the certainty of death—a matter of more importance on the Continent than with ourselves, owing to the precipitancy of interments there. Bring the flame of a candle in contact with a finger or toe for a long enough time to raise an ampulla or bladder. If this contain serosity, life is certainly still present, while, if it burst, discharging nothing but vapor, life is as certainly extinct. In one word, a dry vesicle is a sign of death, a liquid one of life.—*Gaz. Med. de Lyon.—Med. Times and Gazette*.

ELECTRO-MAGNETIC machines are perhaps the least likely of all inventions to supersede the steam engine. The consumption of a grain of zinc, as Mr. Joule has shown, though much more costly than a grain of coal, does not produce more than one-eighth of the same mechanical effect.

## What to Do, and When to Do It.

1. If a man faints, place him on his back and let him alone.
2. If any poison is swallowed, drink instantly half a glass of cool water, with a heaping teaspoonful each of common salt and ground mustard stirred into it; this vomits as soon as it reaches the stomach; but for fear some of the poison may remain, swallow the white of one or two raw eggs, or drink a cup of strong coffee, these two being antidotes for a greater number of poisons than any dozen other articles known, with the advantage of their always being at hand; if not, a pint of sweet oil, or lamp oil, or "drippings," or melted butter, or lard, are good substitutes, especially if they vomit quickly.
3. The best thing to stop the bleeding of a moderate cut instantly, is to cover it profusely with cobweb, flour and salt, half and half.
4. If the blood comes from a wound by jets or spirts, be spry, or the man will die in a few minutes, because an artery is severed; tie a handkerchief loosely around, near the part between the wound and the heart; put a stick between the handkerchief and the skin, and twist it around until the blood ceases to flow; keep it there until the doctor comes; if in a position where the handkerchief cannot be used, press the thumb on a spot near the wound, between the wound and the heart, increase the pressure until the bleeding ceases, but do not lessen the pressure for an instant until the physician arrives, save to glue up the wound by coagulation or cooling of the hardening blood.
5. If your clothing takes fire, slide the hands down the dress, keeping them as close to the body as possible, at the same time sinking to the floor by bending the knees; this has a smothering effect upon the flames; if not extinguished or great headway gotten, lie down on the floor, and roll over and over; or better, envelop yourself in a carpet, rug, bed cloth, or any garment you can get hold of, always preferring woolen.
6. If the body is tired, rest; if the brain is tired, sleep.
7. If the bowels are loose, lie down in a warm bed, remain there and eat nothing until you are well.
8. If the action of the bowels do not occur at the usual hour, eat not an atom until they do act, at least for thirty-six hours; meanwhile, drink largely of cold water or hot teas, and exercise in the open air to the extent of a gentle perspiration, and keep this up until things are righted; this suggestion, if practiced, would save myriads of lives every year both in city and country.
9. The three best medicines in the world are warmth, abstinence, and repose.—*Hall's Journal of Health*.

ONE wise point in the administration of the new line of cable telegraph between France and America is the fixing in the Company's charter of one hundred francs for twenty words as the maximum tariff to be charged. The high rates of the present cable have been perhaps excusable on the ground of a desire to make sure of ample returns for those who took the first risks and made the most precarious investments in what was once so problematical. But it was a timid and narrow policy even in that view; a lower rate would have enormously increased the business done, as it has in postage. By the competition that is to come, this will be remedied.—*Times*.

It has been found by experiments that a stream of electricity derived from a powerful electro-magnetic machine, driven through a solution of brown unrefined sugar, will bleach it, electricity being thus made to perform the function of charcoal. It appears that one of Wilde's electro-magnetic machines, driven by a 15 horse-power engine, has been set up for this object in a sugar refinery in Whitechapel.

## Telegraphers'

## Mutual Life Insurance Association.

## INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

J. D. REID, Treasurer.

## DIRECTIONS TO APPLICANTS.

1. The number admissible as members of the Association at any one time, having been limited for the present to *After Hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

IMPROVED TELEGRAPH INSTRUMENTS,  
Having adopted the use of  
OREIDE METAL,  
which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed.  
His Relays were awarded

#### THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them. Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

#### PRICES.

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	18 00
Main Sounders same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package.

He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers prices.

PATENT PARAFFINE INSULATOR WORKS,  
No. 22 SOUTH TWENTY-FIRST STREET,  
PHILADELPHIA.

All varieties of INSULATORS manufactured at these Works: we warrant to excel the usual style of Glass and Rubber more than one hundred fold. In view of the error and delay in transmission, waste and consumption of battery material, the results of defective insulation, its fragile nature and expense of renewal, nothing is more manifest than its economy.

To RAILROAD COMPANIES relying upon the efficiency of their telegraph departments it is of great value.

# JOURNAL OF THE TELEGRAPH.

NO. 20.

NEW YORK, SEPTEMBER 1, 1868.

VOL. I.

## TELEGRAPHIC STORM SIGNALS.

CINCINNATI OBSERVATORY, July 29, 1868.

DEAR SIR—I take the liberty of bringing to your attention, and through you to that of the Associated Press, a plan of operations looking to a system of storm warnings, such as will, I believe, be highly appreciated by the public.

It cannot have escaped your notice that during the past twenty years very many endeavors have been made by various nations to utilize the science of meteorology. From the Paris Observatory daily bulletins are published showing the state of the weather in Western Europe. In England storm warnings are published many hours in advance and sent to the ports that are threatened.

The great value of such storm warnings long ago suggested the importance of the study of the phenomena of our own climate, and these labors have met with commensurate success. But such endeavors must be long continued and not spasmodic, and in view of their importance, I take the liberty of suggesting a simple plan by which the Associated Press may contribute much towards the progress of the science of meteorology as well as towards its utilization.

The Cincinnati Observatory, because of its central position with reference to the railroad and telegraph systems of our country, may, with special propriety, be made the central station for meteorological dispatches from all parts of the country.

The newspapers daily publish such dispatches from ten to fifty stations, and it is suggested that if the Associated Press will substitute for these the far more accurate and valuable observations of the trained meteorological observers stationed all over our country, and will forward them to this observatory, we will submit them to a careful discussion and will within a few hours return them systematically arranged and condensed to the Associated Press. In this shape they will be of increased value to all who consult them.

We shall, moreover, ourselves enter these observations upon an appropriate manuscript chart, and propose that when we send the daily digest of the weather to the Associated Press, we accompany it with such general predictions of the weather for the next two days, as we may seem authorized to venture upon.

It seems certain, that at least in the case of a great storm, we may arrive at a greater degree of certainty in these predictions than is obtained in England and France where only seven-tenths of the predictions are verified.

Such a system as is proposed would, it is believed, powerfully contribute to advance scientific and practical meteorology. We have received promise of the hearty co-operation of the observers of the Smithsonian Institute and of the army, in case the systematic daily publication of good observations and storm warnings is attempted.

To render these meteorological reports as simple and brief as possible, consistent with accuracy, a series of blanks will be issued to each observer who will each day at an appointed minute (8 a. m., Cincinnati mean time) record the following data:

- a. Barometer reduced to 32° and to a common standard.
- b. Temperature of the free air.
- c. Amount of moisture in the free air.
- d. Direction and force of the surface wind.
- e. Quantity of lower clouds, kind, and direction of motion.
- f. Quantity of upper clouds, kind, and direction of motion.
- g. Amount of rain or snow during past 24 hours.
- h. Condition of the atmosphere (clear, hazy, foggy, &c.)

Further instructions will be given the observers by which the dispatch from each will average twenty or twenty-five numbers or letters. Observers of the requisite experience can be readily found in all desired localities. They should be distributed widely over the country—if not to be found at any desirable point, then the telegraph office at that point will be supplied with the proper instruments and some employee of the company instructed in their use—the company being responsible to the extent of \$100 for the value of the instruments.

The observers will send their blanks to the nearest telegraph office, addressed to the "Cincinnati Observatory," and we must receive them all at the Cincinnati office of the Western Union Telegraph by 12 o'clock, noon. Should there be no communication with any station we are to be informed of the fact and the delayed dispatches are to be forwarded at the earliest opportunity. These dispatches are to remain at and to be the property of the Cincinnati Observatory.

The observers will furnish their observations *gratis*, receiving in return a copy of the Daily Bulletin or summary in a form convenient for preservation.

The daily digest and the weather predictions are to be furnished by the Cincinnati Observatory *gratis* to the Associated Press and to such institutions as unite with us in the undertaking.

At least 100 stations ought to be thus occupied and report daily. If the Associated Press will assume the expense of fifty daily dispatches, it will not be difficult for us to secure the co-operation of other interested parties who will afford the means of largely increasing the number of daily dispatches.

Hoping that this or some improved plan may commend itself to your attention.

I remain very respectfully yours,  
CLEVELAND ABBE, Director.

JOHN A. GANO, Esq.,

Ed. Cin. Commercial & President C. Chamber of Commerce.

## Electric and International Telegraph.

Half year's receipts, £172,828, against £167,461 for corresponding period of 1867. Working expenses and income tax, £101,583; net balance £71,245, against £68,995. The usual 10 per cent. per annum dividends are declared free of income tax, and £12,752 is carried to the trust fund. The telegraph's bill has passed, subject to a money bill next year. The Company will receive 20 years purchase on present net profits.—*London Economist*.

## Correspondence.

BRADY ISLAND, Neb., August 8, 1868.

To the Editor Journal of the Telegraph:

This country appears to have been forgotten entirely; at least so it seems, as I have never seen as much as a mention made that there are railroads and telegraph lines extending to these hot sandy plains, the very centre of the most barren parts of the American Continent. Yet here we have the two great promoters of civilization—the Union Pacific Railroad and the Telegraph.

Now, that mosquitoes have become less numerous, the nights cooler, rattlesnakes blind, and Major Frank North with his Pawnee Scouts have driven the Sioux Indians down to the Republican River, making it safe to let go my scalp for a short time, and so giving me some leisure, I propose, in my own poor way, to give you an account, in brief, of how we operators manage to survive out here on the plains, together with an item on the progress of telegraph lines.

The country here is not entirely bereft of attractions and is not wholly a barren waste as some have supposed. There is some beauty in these rolling hills, and valleys and winding streams. From early Spring to late Fall there are flowers for every month in bloom. The air is pure and delightful, and today, far as the eye can reach over the plains, the broad expanse of green is diversified with flowers of almost every hue, while down on the Platte river banks, clumps of sturdy cotton-wood trees and wild willows shade and adorn its banks.

The scarcity of wood makes it very valuable. Red cedar predominates and is procured from the bluffs on the south side of the Platte river, and has to be drawn by mule and ox teams from 20 to 30 miles, costing the U. P. R. R. Co. delivered at their stations, piled, \$12 to \$15 per cord, poor scraggy stuff at even that. Telegraph poles are procured from the same region, each pole costing \$3.

It is now nearly four months since I made my first *debut* out here, and entered the employ of the U. P. R. R. as operator, &c., and in declaring myself well pleased with my situation, employer and country, I only half express my satisfaction. My anticipations were not over sanguine, hence my pleasant surprise.

The labor is neither arduous nor confining. Of course an operator here, as elsewhere, is expected to be on hand at all times, but there are opportunities for recreation of a pleasant character. The plains abound in buffalo, elk, antelope, deer and prairie chickens, while the streams swarm with ducks and geese. Occasionally for a day, or a half, we have a chance to join in the excitement of a hunt; or in early morning, gun on shoulder, without going far from station, have plenty of opportunities for securing a fresh slice of antelope for breakfast.

We are, of course, deprived of many of the pleasures and delicacies of good society, such as we have been accustomed to in the east. The remuneration, however, is very liberal, which, with a close watch of our scalps, and with the novelty of the country, amply repays for the sacrifice. Then, there are opportunities to accumulate wealth. Several operators

along the line have already quite large herds of stock, while others are making a start in the same business. Some of them will in a very short time become independent and wealthy.

Our mode of living is truly not very inviting, but has its pleasures as well as its disadvantages. There are good substantial frame station-houses located at from 12 to 20 miles apart, the entire length of the road, and are being built as the road advances. At each station there are section houses built by the company for track repairers, and in many instances towns are springing up, as if by magic, about these stations. These section houses are so constructed and managed that operators can find very comfortable boarding houses, where they are provided with good substantial food at a cost of \$5 or \$6 per week.

If you choose you can board yourself—keep "bachelor's hall." It is thought nothing disgraceful for a young man to do his own cooking, and living as economical as he pleases. Many live in this way. I have done so for the last three months, and find that my expenses are but \$10 per month. You can get all your groceries at Omaha by train free of freight, and at eastern market prices. Some operators bring their wives with them, and, as the stations are so constructed that a part may be used for a dwelling house, which is allowed them free, together with fuel and light, in addition to their salary, they can live very comfortably and happy, and in a few years the country will become settled about them and they will find themselves possessed of considerable property.

I would not have you think in painting this picture I am trying to induce operators to come out here by any means. I am merely giving you the facts as they are with us. I would not advise any young man to come, although I believe any young, experienced number one operator, coming well recommended, would find no difficulty in securing a good situation.

The Union Pacific Railroad is being rapidly pushed forward to completion. Only last week another section of 160 miles west of Laramie, of the road was opened with ten new offices requiring twenty operators. These have all been filled now at salaries varying from \$65 to \$85 per month.

The great national iron thoroughfare that will soon span the continent, is now in operation 692 miles west of Omaha, the western terminus being a mushroom town called Benton. The road is divided up into divisions of equal distances, A, B, C, and D. The management of the telegraph line belonging to the railroad company is under the able superintendency H. H. Cook, Esq., of Omaha, whose system of management precludes the possibility of the trains coming into collision on any part of the road. The boys all speak well of him.

The Western Union Telegraph Company, with W. B. Hibbard as Superintendent of Western Division, at their head, are building a double line of telegraph from Omaha to San Francisco this summer, and with some seventy men are putting up eighteen miles of post per day. In the course of a week or ten days the lines will be in working order to Cheyenne. These lines are to take the place of the old route on the south side of the river. This will give us four lines, two on each side of the railroad, and will, when completed, add materially to the appearance of the road. There are forty poles to the mile in the new lines. The wires are fastened over to each end of cross arms, attached to the poles about three feet from the top, leaving room sufficient for another line on the top, to be erected some time next season.

Respectfully yours,

W. J. BIGGAR.

We return thanks to Mr. Biggar for his interesting letter and hope often to hear from him. He is in a country pregnant with a great future.

#### Cook's Automatic Telegraph.

There can be no two opinions as to what are the essentials points to be secured in a Telegraphic System which presents itself for acceptance as a State Telegraph—correctness, speed, and economy. Facility of manipulation and simplicity are the inevitable corollaries of the first and second, while the third almost necessarily follows from these two qualities of easy manipulation and simple mechanism. All instruments, then, must be estimated by their possession, relatively to each other, of these qualities.

Mr. Cook's new Telegraph asserts roundly its pre-eminent claim to all three: First, as regards correctness, the dispatch set up in ordinary type, and in the same sense in which it is written, can be verified by a competent reader, or by the sender himself. From this moment all possibility of error is absolutely eliminated; either the message does not arrive at all, or it arrives with mathematical correctness. Correctness is of prime importance: a message which is not intelligible, or in which misconstruction is possible, can never be cheap, and its speedy delivery is a mockery. Next to accuracy comes rapidity. Taking into account all the vicissitudes of a telegraphic service, it is evident that the vital point to be attained is the *minimum occupation of the line*. This great desideratum forms one of the chief claims of the new system; from eighty to one hundred messages per hour can be transmitted with ease and certainty over distances of a thousand miles,—sixty to eighty over still greater. The service is but partially suspended by the breaking down of a line. As the messages arrive they are set up in type, and the moment the communication is re-established they are passed under the instrument with wonderful rapidity. This advantage can only be possessed by a typographic or autographic instrument.

Owing to various causes the type-setting part of the process has been completely misunderstood, calculations based on the type-setting of even the best compositors in ordinary establishments being absolutely erroneous. Without entering into the causes Mr. Cook does not hesitate to guarantee an average rate of fourteen words per minute as the rapidity attainable by young girls or boys, with a few week's practice. It is evident, therefore, that as each compositor can set up forty-two messages of twenty words per hour, three will suffice to keep an instrument in full work, while the manipulation of the instrument is so simple as to require a single clerk only. As the message requires no transcription, but is sent as it arrives, a great saving is effected alike in time and expense. The instruments are not materially more costly than the Morse; will work under conditions in which the Morse signals become illegible, and are independent of the carelessness and inattention of the transmitter, and will moreover send at least three times the average number of messages. They become relatively much cheaper in minor stations when the work is not sufficient to keep two instruments in full operation. The fact that the machine may be used at will and without any loss of time, either as transmitter or receptor, is a great advantage, while by the simple turning of a button they are rendered autographic. Of course the penalty of loss of speed in these as in all other autographic instruments has to be paid, but four and twenty messages per hour may be transmitted with certainty.

The object of the inventor has been to produce an instrument in which error is out of the question, speed attained, and economy effected. The one is effected by the setting up of the message in type, the second by the automatic and chemical action of the instrument, the third by the substitution of ordinary for highly skilled labor, and the substitution of one for several instruments; once regulated, the instruments keep in order an indefinite time, a certain

discretion in the relative force of the printing and counter currents in order to meet the accidents of weather, loss to earth, &c., being all that is required is far from absolute and is perfectly attainable by the simple means adopted with the consent of the inventor, Mr. Hipp. Unlike the Hughes instrument Mr. Cook's improvement on Bowditch's is affected in an insignificant degree by defective synchronism. In the former the substitution of one letter for another, and consequent error, the instruments are synchronised, but the exactitude required is the result; in the latter the legibility and correctness remain intact, only the printing is more or less inclined to the right or left, instead of being, as it is when the synchronism is perfect, absolutely perpendicular, but it is clear, for instance, that an E remains an E, whether it be printed E. E. E, S. S. S, P. P. P, and this divergence represents a maximum of defect.

It now remains to describe, briefly, the *modus operandi*.

Each instrument is provided according to the exigencies of the service with a given number of compositors, or type boxes, easy to hold, conveniently disposed for the reception of two, four, six, eight, or ten lines of type—the message is set up rapidly, verified, and placed in the machine. The pressing of a button warns the machine clerk at the opposite station, that a message is coming, he places on a metallic plate a sheet of paper of a certain size, which has been previously dipped into a weak solution of Iodide of potassium, places this plate in its place on the instrument, and turns the manipulator to the letter R, thus establishing the circuit proper to reception; the clerk at the transmitting end has, by this time, placed his type, set the message in its place, and the instant he turns his manipulator to the point establishing the circuit needful for transmission, the two instruments are set in motion, the point passing at the one station over the metallic surface of the type, at the other, over the prepared paper; this passing over repeated five times produces a perfect reproduction of the type, and as each passage of the style or point occupied two seconds, and each line contains ten words at least, it is clear that a message of twenty words is produced in twenty seconds, or three per minute, one hundred and eighty per hour. This rapidity is of course modified by the substitution of one message for another, but with the most ordinary attention, a hundred messages may and have been transmitted within the hour. The printed paper is then detached from the plates, immersed for a few seconds in water, passed under a roller, and put into its envelope, which (as the address is printed first) is already prepared and sent to its destination.

HENRY COOK.

#### Sunshine.

The country houses of Great Britain are by no means shaded as our own, and the most considerable piles of buildings, such as Eaton Hall, Blenheim, Dalkeith, and Burghley House, have hardly a noticeable tree within a stone's throw of their walls. The flower patches and coppices of shrubbery approach more nearly, and to the garden front of those magnificent homes, you walk through walls of blooming shrubs. But the full flow of sunshine upon the window is a thing courted. Allowing for all difference in climate, I think there may be a question if we do not err in this country by overmuch shading. A cottage in a wood is a pretty subject for poetry, but it is apt to be uncomfortably damp. And there are village streets with us so embowered that scarce a ray of sunshine can play fairly upon the roofs of fronts of the village houses from June to October. A summer's life under such screen cannot contribute to the growth of roses in the cheeks any more than to the growth of roses at the door. There is no provision against agues—whether moral or physical—like a good flow of sunshine."—*Rural Studies*, Donald G. Mitchell.

MR. EDITOR—In looking over a little work entitled "Smith's Manual of Telegraphy," published by L. G. Tillotson & Co., of New York, I find on the 45th page, where speaking of Lightning Arresters, he says: "A short piece of wire (six inches long) considerably longer than that in the relay magnet, run from each main circuit binding screw of the relay, and the ends dipped into a small bottle of water, forms one of the best protections against lightning. The distance of the wires from each other in the water, as also their depth in it, may be varied, but they must not be allowed to come together. Water being a poor conductor of galvanic electricity, only a small portion of the current will pass through it, the larger part choosing the magnetic wire; but atmospheric electricity being possessed of enormous intensity prefers the short water route."

I was forcibly impressed with the simplicity and seeming perfect adaptation of the above described arrester to the protection of the fine wire of the relay magnet from atmospheric electricity, and having been recently "burned out," I gladly adopted the above described plan for the protection of my relay, and constructed and used one for about three weeks, allowing my instrument to remain on the line during the prevalence of a thunder storm, long after I was aware that other operators who were experiencing the same storm, had "cut out" without any injurious result, and was beginning to feel that "the burned child need no longer dread the fire," until one day our worthy Division Superintendent called into the office, and observing the arrester attached to the relay, asked "What that thing was for," and when told, and the theory explained as well as I could, he objected to its further use, upon the ground that "it resisted the action of the main line current." I objected to that by saying that there was no possible escape, and that the current had the same facility for passing through the relay that it had before the arrester was attached, the same wires to conduct it being undisturbed. He answered me "that I did not understand the laws of resistance," which is perhaps only too true, yet I did not feel quite satisfied. Please favor us with your views upon it.

#### OPERATOR.

We omit the date of this communication to prevent trouble to the writer. We are unwilling to believe there is a superintendent anywhere so stupid as to suppose that the mere insertion of wires as stated increases resistance to a main current. The objection to such a lightning arrester is the diminution of the current passing through the magnet, by which action might be impaired, and its proximity to the magnet.

#### Philadelphia.

The Western Union Telegraph Company, at the southeast corner of Third and Chestnut streets, is one of the great institutions in the way of transmitting and receiving information to nearly every town and city in the United States, to Canada, England, Egypt, and even China. To accommodate this vast business, 123 wires enter the building, and are connected with two batteries; one of 65 cups, with a positive pole, which furnishes battery power to 28 different wires; the other with 45 cups and a negative pole, furnishes power to 11 different wires. Of the 123 wires, 49 are known as through wires, sending messages direct to certain given points. Twelve are for way stations; 26 are loop wires for use in connection with branch offices; 11 wires for city office, and 25 to be kept for contingencies. These lines connect with 49 instruments in the fifth story, all messages received by these are given to the operator by sound instead of on paper, as originally invented, and three are connected with printing machines located on the first floor.

The wires lead out of the office as follows: 24 to New York; 15 to Washington; 10 to Pittsburg; 1 to Cape May; 1 to Salem, N. J.; 2 to Scranton, by

way of Trenton and Easton; 1 to Atlantic City; 1 to Long Branch, and 1 to Williamsport.

The force required to carry on the business of the office is thus summed up: 39 operators of Morse instruments, 3 of the printing; 16 clerks; 8 office boys; 30 messengers; 1 janitor; 3 for turning printing machine; 1 battery keeper; 8 repairers; 6 branch office clerks; 34 clerks on city line; 1 manager; 1 office clerk; 1 night clerk; 1 cashier; also on city line, 37 operators; 2 clerks; 1 superintendent, and 21 messengers, making a total of 214.

The wires of the Philadelphia office have recently been very skilfully arranged by Mr. M. V. B. Buell, Assistant Superintendent. Few men in the service know better how to do it.

#### Manipulating with an open Circuit.

To the Editor Journal of the Telegraph:

The plan of working telegraph lines suggested by W. C. Havens, in the last number of your paper, though possessing valuable features, is by no means a novelty. In the American Fire Alarm Telegraph used in the principal cities in the United States, the keys and relays for communicating between the signal boxes and the central station by "Morse," are arranged on this plan, so that when the key is depressed, the main line is broken and the circuit closed. The European railway lines, working the Morse system by a continuous current, are invariably arranged in this manner. It is in several respects an improvement on the plan in general use in this country, and is worthy of more attention than has hitherto been bestowed upon it. P.

NEW YORK, Aug. 4, 1868.

#### Self-Closing Keys.

We are still in frequent receipt of various contrivances to accomplish the automatic closing of keys after use. The plan proposed by Mr. W. H. Haven in a late number effectually accomplishes this, when the open circuit is used to manipulate, and has been in use for many years on the continent. Our correspondent "P" testifies to its merit, and with such an endorsement we are satisfied. Indeed the mode is so simple that it commends itself.

We have given us by Mr. Jos. J. B. Frey, of N. Y., another mode of effecting the same purpose. The key as shown to us is made of simple brass wire and certainly has whatever merit there is in simplicity. The explanation is as simple as the design and requires no change in any of the present appliances except the key. Indeed the present key with an insulated anvil beneath the back adjusting screw, and the ordinary anvil made neutral, accomplishes the same thing. It is only necessary then to read with the back stroke of the sounder, which can easily be done by deadening the ordinary anvil.

Here is a sketch we have made of Mr. Frey's key, for which he has applied for a patent.

1—Is a neutral anvil.

2—Is a detaining loop on which connection is made by the back stroke.

3—Is the spring, which, like our friend Benton's, is a part of the armature.

The key is manipulated exactly as in the usual manner, only that the sounders are read from the back stroke. Of course the key is always closed when at rest. In operating, the shaft of the key must always be allowed to go up promptly so as to make connection on the detaining loop or secondary anvil, or adjusting screw as may be adapted. A system adapted to the use of these keys would for ever prevent open circuits.

MR. FIELD reports the failure of the cable of 1866 at 35 minutes past 12 on Monday, August 3d, supposed to be caused by an iceberg on the Newfoundland coast. These recurring casualties from icebergs suggest the conviction that another and more southern landing place must be found, where interruption from this source will be impossible. Connection with Europe by telegraph is now too important to leave us indifferent respecting any means by which the fear of losing it may be removed.

#### Florida.

TALLAHASSEE, Fla., Aug. 5.—The bill ordered to a third reading, relative to the oath for telegraph operators, was not totally disposed of until to-day, when it was defeated. It proposed taxing all telegraph companies in the State one dollar per mile for land lines, and fifteen dollars on cables. The oath was to be "iron clad."

PROF. TYNDALL concludes his memoir of Faraday with the following beautiful tribute to his memory: "You might not credit me were I to tell you how lightly I value the honor of being Faraday's successor compared with the honor of having been Faraday's friend. His friendship was energy and inspiration, his mantle is a burden almost too heavy to be borne."

STUART, then manager of the Winter Garden Theatre at New York, and the husband of the well known actress, Julia Barrow, had planned to have gumbo soup in their summer retreat at New London once upon a time during the war. Gumbo soup needs okra, a plant unattainable short of New York, whither Barrow went for it, and was to telegraph to Stuart, that all might be ready. But Stuart received no telegram, and the soup waited till next day. That noon the Norwich paper, amid the war despatches, contained this: "Stuart—have got Okra—Barrow." The next day the New London paper elaborated it into the capture of Okra, an important place on the South Carolina coast, by the federal General Stuart, and the gumbo soup was relished all the better for the zest added by this remarkable victory.

To the Editor Journal of the Telegraph:

We have just received notice of an error in transmission in a cable message to Liverpool, wherein the word "hoax" was made to read "oaks." Our friend Smith suggests that the dialect of the English instruments is responsible for the "bull."

Respectfully, CABLE ROOM.

The cable mechanism neither records nor articulates by sound. An operator has to watch the changes of a reflected light, and read off to an assistant. If the operator is a genuine "John," it is easy to see where that unfortunate aspirate was lost. Or can it be that these English instruments have learned to repudiate the "haitches?"

Mr. M. R. Wolff, formerly of general telegraph office of P. C. and St. L. Railway, Steubenville, Ohio, has been appointed ticket agent of C. and P. Railroad and manager of W. U. Telegraph office in that city.

#### A Model Scientific Writer.

Professor Fraser says with regard to Sir David Brewster's great precision, energy, and determination of thought—that during the seven years that he (Professor Fraser) was editor of the *North British Review*, Sir David Brewster contributed an article to every number; and that he did far more—that he stated the day when his first slip of paper would come, and the day when it would be finished. His manuscripts came as they were written—day after day, and sheet after sheet—and without the necessity of a revision of those preceding. He thus worked with the precision and regularity of a mechanical rather than a mental machine.—*Scientific Review*.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address— JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, SEPTEMBER 1, 1868.

### The Difference.

The *London Economist*, of August 8, says, in reference to the price to be paid for the English telegraphs by the Government:

"It is objected that Government is going to give too much for the telegraphs. But a Government in such cases *must* expect to pay dear. They grant a privilege and then buy up the privilege; they authorize an experiment and then purchase the good result; and in fairness the Government ought to pay dear; and in practice a Parliamentary Government *must* pay dear."

What does the English Government pay to the Telegraph Companies for their property? It pays a sum the equivalent of the *net profits* of 20 years. The chief telegraph company of England is the "Electric and International," which declares an annual dividend of 10 per cent., besides a surplus applied to what is termed a "Trust Fund." Taking ten per cent., however, as the basis of profit, the English Government agreed with the telegraph companies *before* the passage of the recent bill, by which the Government was authorized to acquire their lines, to pay therefor *twice the amount of their capital*. And in this they do no more than simple justice. A private company under a government charter has demonstrated, at its own risk, an important agency of power, usefulness and profit. By all the laws of honor it is entitled to its success and all its fruits, present and prospective. The British Government recognizes this, and pays accordingly. Had it been a failure, no offer of participation in the loss would ever have been made.

Were the same offer made in America, we suspect that stockholders would not much object. The Western Union Telegraph Company is legitimately earning now six per cent. per annum, although paying only four. If Government were to say to its President, "We want your lines; you have proven their great value, fairly and enterprisingly; we can utilize the post office force in their management; we will purchase your stock at a premium of 20 per cent. on its par value, equal to 20 years of net profits at six per cent."—we think the President would very respectfully accept the offer, however much he might doubt the policy of the governmental assumption of such an enterprise. Even were the offer 80 per cent., or 20 years profit on an annual basis of four per cent., as now declared, we think he and all the people would say "amen."

But Mr. Washburn in the American Congress, using only the fact of the English Government's assumption as a proof of private incompetency, asks \$75,000 to destroy existing enterprises by *competition*, and while praising the inventor of the telegraph, seeks to rob him of that which is more necessary to him than fame.

If the example of foreign nations in their treatment of public enterprises is to be taken by our own, we object to the elimination of that justice which, in some respects, allays apprehension of the evils to the public which the change might inaugurate, and which in this country we assert must necessarily follow the Government management of our telegraph system.

### Wanted—A Common Language.

As the nations become united by sub-oceanic cables, the need of a common language becomes evident. The proposed extension to China increases this. An English or American operator can transmit messages in French, Spanish, or Italian; but when it comes to the Chinese, whose 80,000 characters are like ingenious changes on fiddlesticks and chicken's feet, human ingenuity is at fault.

On the Chinese coast, between the large seaboard cities, messages will probably be required to be written in English. This will lead to the acquisition of the language. Interpreters will be used for translation, and as intercourse increases with our Pacific territory, the English language will more and more become to China a necessity, and the basis of a system of education in which the study of the English language will form a prominent part. Thus the unity of languages will begin. When the nations of the earth are bound by a common bond, and are cast face to face with each other by the telegraph in the necessities of commerce and the discussion of political problems, there must be some common speech by which, without misinterpretation, the language of all shall be understood. Autographic telegraphs will be useful, but a common language is the *sine qua non*.

WE have been favored with a visit from Sir Charles Bright, the well-known English electrician, since his unfortunate mission in connection with the second Cuba cable. Mr. Bright is a gentleman of cultivation and refinement, and we were glad to see him among us, although the visit would have been more cheerful to both had his Cuban work been successful.

Sir Charles had a fine opportunity, while here, to correct some misapprehensions which he had shared with reference to the working of the land lines which connect with the Atlantic cable. A circuit of 1200 miles from New York to Plaister Cove, worked with a rapidity which practically annihilates the intervening space, and with a single repeater at St. John, surprised him. Without previous call messages were sent in his presence to the managers of these distant offices, and replied to without an instant's hesitation. This circuit is perhaps the best on the continent, and worked with the most commendable care. Every message for Europe is repeated, and no error has occurred on it for the past twelve months. Although the wire on a part of the route is imperfect and soon to be replaced, and the insulators are of the common modes, no weather prevents prompt and accurate transmission.

WE regret the ill-success attending the laying of the second Cuba cable. Want of knowledge of the currents of the Gulf has been the cause by which a larger amount of cable was required to make up for the sinuosities of the course of the vessel than was provided. A few miles more of cable would have prevented the misfortune which now postpones to another season all attempts to restore it. Still the present cable performs the work of the line well and satisfactorily, and a little more experience may enable its energetic managers to largely increase its capacity for transmission, and execute easily all the business which may be offered.

By a recent letter from our friend C. F. Varley, we learn that he has been engaged as consulting electrician in the proposed laying of the cable from Brest to the United States, of which so much lately has been said. So next year we may expect to see his pleasant face among us again.

THE English test of the Varley and Brooks insulators, see page 6. It has been long in type. There must be excellence in an insulator which, with such a test, shows such a record. Examine it.

### OFFICIAL STATEMENT.

Western Union Telegraph Company.

JULY, 1868.

Gross receipts,	- - -	\$601,730 61
Current expenses,	- - -	396,163 66

Net profit,	- - -	\$205,566 95
-------------	-------	--------------

Above expenses include an unusual outlay of \$35,129.87 for reconstruction.

THE *Economist*, of August 15, notices at length the prospectus of the Societe du Cable Transatlantique Francais for a direct line of cable to the United States. The Government concession is to Baron d'Erlanger and Julius Reuter, for twenty years from September 1, 1869. A wire has been secured between England and Dieppe. It thus appears that the route of the cable is from France to England, thence to Brest, thence to the Island of St. Pierre, and thence to the United States. Total distance, 3047 miles. The steamer Great Eastern is engaged to lay the cables. The core wire is 400 lbs per knot. The minimum tariff will be £2. The capital is 60,000 shares of £20. The concessionaries receive 5000 paid up shares, also, one-fifth of the surplus over 10 per cent. and deducting 5 per cent. of profits as a reserve fund. Sir James Anderson is General Superintendent. M. Drouyn de L'Huys is on the Committee in France.

OVER FIFTY THOUSAND of the Brooks' Insulators have been sent to California this season, mostly for the Central Pacific Railroad. A letter from Mr. F. L. Vandenberg, Superintendent of the Telegraph, dated Sacramento, February 10, referring to their use there, says:

"I pronounce them the greatest improvement introduced into the telegraph since its existence." \*

### Telegraphers' Mutual Insurance Association.

It is known that for some months the Executive Committee of the Telegraphers' Mutual Life Insurance Association has declined applications from the extreme South. We are glad to say that this restriction is now removed. It was a measure of precaution.

We cannot avoid urging all to connect themselves with this organization. Two brother operators have died and their families been provided with ample means of burial. It is a noble and easy charity. Every policeman in New York is thus insured. Each pledges a dollar from his salary to be given to the family of the first man who falls. Does it not appeal to the generosity of every good man to do likewise? See advertisement.

### ASSESSMENTS RECEIVED.

## TRIP TO TIP-TOP.

## Opening of the Mount Washington Railroad.

BY A TELEGRAPH SUPERINTENDENT.

To the Editor of the Journal of the Telegraph.

On the 13th of the present month a party consisting of delegations from the New England Railroad Companies, members of the press, and of the Western Union Telegraph Company, left Concord for the White Mountains, to inaugurate the opening of the Mount Washington Railroad. This is the Cog railroad to the summit, of which there has been so much talk for two or three years past.

Stopping at Plymouth, we dined at "Pemigewasset." This is a magnificent Summer house, and well patronized. The scene here was gay and festive. Two long trains stopping in front of the house for the passengers to dine (none of your "five minutes for refreshments," but a good half hour), the long wide platform filled with guests of the house and passengers who had already dined, and were now enjoying their cigars and meerschaums before taking to the rail again, the band discoursing their sweetest strains, altogether gave an impression of the pleasantest character, and many were heard to exclaim, "I mean to come here again."

Leaving the Pemigewasset we went on to Littleton, some sixty miles, where we left the cars, and were transferred to coaches, provided for the occasion, and after riding 5 miles stopped at Bethlehem (not of Judea). Here there was some discussion as to whether we should stop all night or go on to the White Mountain House, some 12 miles further. Knowing how some people dislike to turn out in the morning, I was decidedly opposed to camping so far from the scene of the next day's labor. It was finally decided that the bulk of the party should go on, and we accordingly started, and arrived at the White Mountain House about 8½ P. M. We found the House crowded with guests. The landlords were pleasant and courteous, and did all they could do under the circumstances.

I was blandly informed that I could have a berth down on the floor, but disdaining so downy a couch, I reckoned I knew a game worth two of that, and going to the "Instrument" called up Crawford House and asked "Doyle" if he could take care of myself and a few friends. "Yes, Sirree!" was his pleasant response, "come along and we will do you good." So in a few minutes, with half a dozen companions, we were on our way to Crawfords, in the best coach I ever rode in.

In less than an hour we were pleasantly received and comfortably located in the Crawford House, by mine host, Doyle. A nice supper was discussed and a cigar enjoyed, when we were shown to our rooms, and for one, I can say my slumbers were peaceful and serene.

In the morning Messrs. Wolcott & Doyle fitted us out with a spanking four-horse team and after partaking of a hearty breakfast of trout that had leaped from the brook into the frying pan, we started for a 11 mile ride to the depot of the Mt. Washington R. R. Co., which we did in about an hour and a half. We found about two hundred people congregated and the cars in possession, so that one of the Directors was obliged to state to them in a gentle manner, but without circumlocution, that the excursion today was for invited guests. Most of them took the hint and vacated, and in a few moments we were under way.

I first took a good look at the underpinning and made a careful inspection of the running gear, and satisfied myself that there was no chance for a sudden slide, and then took my seat in the car without a single apprehension. We had a heavy load and went rather slowly. We stopped several times to "water up" and give the passengers a chance to

look around and enjoy the landscape. These stops were facetiously termed "ten minutes for refreshments." The engine shoves or pushes the car up. Each car is controlled by brakes in a peculiar manner, so that it really seems impossible that anything should so give way as to let the cars slide.

Our telegraph wire runs along on the stringers as far as the road is completed and then goes off on its own hook up to the Tip Top and down the other side to the Glen House.

This trip was all the more interesting to me, as I had the honor and the pleasure a few years since, in company with Gen. M. Lefferts, then general superintendent of the American Telegraph Co., of introducing the public to Mount Washington by telegraph, and two or three years more will develop a rail road depot, and, I hope, a large and commodious hotel on the summit.

The premises being in litigation, has alone prevented the erection of a fine house.

Next season the public can go over the Mountains either way. Up one side by rail, and down the other by carriage, or vice-versa.

If any telegrapher should stray up there with a limited amount of funds, I would advise them not to put on any airs, but to make tracks before they obliged to throw themselves upon the generosity of the hotel keepers.

A case of this kind occurred a few days ago, and I trust the young man found his way home a wiser and more humble man, than when he booked his name with such a flourish on the hotel register.

I might tell you something of the difficulties attending the running of and the maintaining of a telegraph wire in these mountain regions, but I have already written too much. I send you a few photographs of the railroad, which will give you some idea of it, and hope that next season you may be able to see and try it yourself. Very truly yours,

J. S. B.

In a lecture delivered at the Royal Institution On the Doctrine of the Correlation of Force in its bearing on mind, Professor Alexander Bain shows that the extension of that correlation to mind must be made through the nerve-force. According as the mind is exerted, force is drawn away from the proper corporeal functions, which are to that extent weakened. We all know by common experience that great mental exertion is rarely combined with great physical robustness; neither do we find many principles of a combination of different modes of mental excellence. Leonardo de Vinci was a great artist and a great man of science; but how few have there been like him! Great sensibility is seldom associated with great activity of temperament, nor intellectual originality with emotional exuberance.

WE call attention to the advertisement of Jos. J. B. Frey. These keys will be very neat and, by necessity, self-closing. Chester makes them. Chester is always neat. Any circuit can be worked with them. The ear takes the back stroke readily. Though the manipulator is on an open circuit, the change is scarcely perceptible, sometimes not at all. The circuit is closed when the key is open!

WE regret to learn of the suicide of Joshua Rab-bath, delivery clerk of the Louisville office of the Western Union Telegraph Company, after a faithful service of nearly fifteen years. He has two sons in the service, both of whom are excellent operators as well as excellent men. Suicide suggests some heavy mental burden of which life has become weary. Suicide at 69 seems very sad.

WE are obliged to place several valuable advertisements on page 6.

For the corrected cable tariff see page 6.

## TARIFF BUREAU.

## Semi-Monthly Circular.

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
September 1, 1898.

To all Offices on W. U. Lines—

The following changes have occurred since August 15, the date of the last Tariff Order. Please note them in your Tariff Book:

## NEW OFFICES.

Bismarck, Mo., tariff same as Dent Station, Mo.  
Canton, Mo., tariff same as Palmyra, Mo.  
Croton, Iowa, tariff same as Summit, Iowa.  
Flushing, L. I., tariff 30 and 3 more than New York City.  
Howlett, Ill., tariff same as Niantic, Ill.  
Lagrange, Mo., tariff same as Palmyra, Mo.  
Lees Summit, Mo., tariff same as Independence, Mo.  
Marseilles, Ill., tariff same as Leland, Ill.  
Pikeville, O., tariff same as Union City, Ind.,  
Putney, Vt., tariff same as Brattleboro, Vt.  
Sand Prairie, Iowa, tariff 90 and 6 from Chicago, 75 and 5 from St. Louis.  
Sheridan, Ks., tariff same as Monument, Ks.

## NEW OFFICES ON OTHER LINES.

Rochester, N. H., tariff 25 and 2 from Great Falls, N. H. Check Great Falls.  
Union, N. H., tariff 25 and 2 from Great Falls, N. H. Check Great Falls.  
Alton Bay, N. H., tariff 30 and 3 from Dover, N. H. Check Dover.  
Ft. Ancient, O., tariff same as Morrow. Check Morrow, O.

## OFFICES CLOSED.

Dent Station, Mo., Monument, Ks., and Nannet, N. Y. Business for Nannet will be mailed at Suffern, N. Y.  
All offices having "special sheet A" will hereafter use the "special rate" to Nashua, N. H., when computing tariff to offices, on Nashua, Milford and Peterboro Telegraph Line, paying to W. U. Co. at Nashua.

## GENERAL INFORMATION.

The name of the office heretofore known as Weber, Utah, has been changed to Echo City, Utah, and Lyons, Ill., to Riverside, Ill.  
All offices west of Buffalo, N. Y., should check Buffalo on all business for Binghamton, N. Y. It is an Erie line office.

WILLIAM ORTON,  
President.

## MARRIED.

On Thursday, August 20, by the Rev. Dr. Gallaudet, Watson D. Schram, Manager of the Western Union Telegraph Co.'s office at the Board of Brokers, N. Y., to Josie, youngest daughter of John Sneckner, all of N. Y. city.

## FREY'S SELF-CLOSING TELEGRAPH KEY.

- 1.—Hard Rubber Point.
- 2 and 3.—Platina Point.
- 4.—Negative Anvil.

Invention can be adopted to any pattern or style of key. See Editorial description. The Right of Manufacture and use in Foreign Countries for sale. Address

JOS. J. B. FREY, INVENTOR,  
New York City.

WM. KIDD, C. H. PEIRCE,  
A. BOODY, C. S. OTIS.

KIDD, PEIRCE & Co.,  
BANKERS,

19 BROAD STREET AND 57 EXCHANGE PLACE,  
NEW YORK.

Stocks, Bonds, Gold and Government Securities bought and sold on Commission.

S. S. STAFFORD'S  
COMBINED  
WRITING AND COPYING FLUID,  
Labelled by me, for the last ten (10) years, ARNOLD'S FLUID  
Superior to any Fluid used. It is Greenish Blue in color, turning Jet Black, flows freely, dries rapidly, does not set-off in books, gives one or more excellent copies. Has no sediment, can be used to the last drop. It is 33½ per cent. cheaper than any other (so called) combined ink. Used exclusively by the Western Union Telegraph Company.  
For sale by all Stationers and Druggists, and at No. 11 Cedar street, New York.

S. S. STAFFORD,  
Chemist, N. Y.

## EXECUTIVE ORDER No. 64.

## Reduction of Tariff on Atlantic Cable Business.

On and after September 1, 1868, the rates of tariff on Atlantic Cable business will be as follows:

## TARIFF IN GOLD TO ANY POINT IN GREAT BRITAIN AND IRELAND.

From all points in Nova Scotia and New Brunswick, except Sackville, . . .	10 words or less.	Each additional word.
" Sackville, N. B., . . . . .	\$16.35	\$1.63
" Boston, Mass., . . . . .	16.10	1.61
" New York City, . . . . .	16.65	1.66
" all points in Maine, New Hampshire, Vermont, Massachusetts (except Boston), Rhode Island, Connecticut, New York (except N. Y. City), New Jersey, Pennsylvania, Delaware, Maryland; and District of Columbia, . . . . .	16.85	1.67
" All points in Virginia, West Virginia, North Carolina, South Carolina, Georgia, Alabama, Mississippi, Louisiana, Tennessee, Kentucky, Ohio, Indiana, Illinois, Michigan, and Wisconsin; also, from St. Louis, Mo., and Lake City, Tallahassee and St. Marks, Fla., . . .	17.35	1.72
" All other points in Florida, . . .	19.00	1.83
" All points in Texas, Arkansas, Missouri (except St. Louis), Kansas, Nebraska, Iowa, Minnesota, Colorado, Dakota, Wyoming, New Mexico, Utah, Idaho, Montana, Nevada, California and Arizona, . .	22.50	2.13
" All points in Oregon, Washington Territory and British Columbia, . .	21.75	2.08
" All points in Oregon, Washington Territory and British Columbia, . .	24.75	2.33

We are notified of following changes in rules for Checking, Counting, etc., which otherwise remain unaltered, as per Executive Order No. 58, published in the JOURNAL OF THE TELEGRAPH, February 15, 1868.

Figures in ordinary messages must be expressed in words, thus "2," two—"4-5," four fifths. The charge will be for the number of words and letters without regard to the figures they represent.

Count two-pence, three-pence, &c., up to eleven-pence inclusive, each one word.

Prepaid answers must be presented for transmission not later than eight days after arrival of original at delivery station. If answer of only ten words is prepaid, it is sufficient to insert in original message "reply paid."

In messages repeated back from destination to originating station, the words "repetition paid" must be inserted after address and charged for.

Code messages, constructed, for purposes of secrecy, of disjointed sentences or words, rendering the meaning unintelligible, will be transmitted with every possible care, but the Telegraph Companies while willing to investigate, by post, complaints respecting errors in such messages, will not return the charges upon them unless they be "repeated messages." Should the receiver of such a message have it repeated, the amount paid for application and reply will not be returned unless the message was originally a "repeated message" and paid for as such by the sender.

## TARIFF TO PLACES BEYOND GREAT BRITAIN AND IRELAND.

On messages to places beyond Great Britain and Ireland, charge the following rates, in gold, in addition to the tariff to Great Britain and Ireland:

20 words or less.	30 words or less.
Belgium, . . . . . \$ 63	Spain, . . . . . 3.25
France, . . . . . 84	Algeria, Portugal, Turkey, . . . . . 4.00
Holland, . . . . . 94	key in Asia, . . . . . 4.25
Switzerland, . . . . . 1.46	Ionian Isles, . . . . . 5.63
Prussia, Austria, German States, . . . . . 1.50	Russia in Asia, . . . . . 7.38
Channel Islands, . . . . . 1.67	Tripoli, . . . . . 12.38
Denmark, . . . . . 1.75	Alexandria, . . . . . 13.38
Sweden, . . . . . 2.00	Cairo, . . . . . 15.63
Norway, . . . . . 2.18	Suez, . . . . . 25.25
Italy, Turkey in Europe, and Greece, . . . . . 2.25	India, . . . . . 25.75
Russia in Europe and Sicily, . . . . . 2.50	Ceylon, . . . . . 25.75
	China, Port Galle, . . . . . 27.00

For each 10, or fraction of 10 words above 20, charge in addition, one-half of these rates.

We are notified of following changes in Rules relating to Continental business:

Determine the number of chargeable words by count of actual words in the entire message, including address, date and signature, without reference to the number of letters.

All compound names and words count for as many words as they contain.

The Continental Telegraph Companies will not entertain or investigate complaints of error or delay in unreported messages.

In all other respects Rules contained in Executive Order No. 58, remain unchanged.

WILLIAM ORTON, President.

## AMERICAN COMPOUND TELEGRAPH WIRE.

SUPERIOR CONDUCTIVITY,  
LIGHTNESS AND DURABILITY.

## A MOST IMPORTANT INVENTION.

We would call the attention of Officers of Telegraph Companies, Telegraph Builders and Contractors, and the Public, to the new

## PATENT COMPOUND TELEGRAPH LINE WIRE.

## Manufactured by the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY,  
OF NEW YORK.

This Wire has already been put up on sections of several Telegraph Lines, and its merits fully tested, and the results show that it combines all the good qualities which are claimed for it, viz., Economy, Superior Conductivity, and Increased Strength, with Decreased Weight of Metal.

In its composition are used three metals, either of which is a good conductor, Steel, Copper and Tin; and the superiority of Copper as a conductor over other metals is well known, and but for its ductility rendering its permanent suspension in a pure state intact impracticable, it would have always been used exclusively as a Conductor on Telegraph Lines. By combining it with Steel the desired strength and permanence is attained, and the necessary weight of the line wires reduced two-thirds, thus obviating the necessity for using a large number of poles to the mile, and by reducing the points of contact, lessening the chances for trouble and escape of the electric fluid.

All other Line Wires must inevitably be superseded by this, and such Telegraph Companies as now adopt it will the sooner realize the advantages to be derived from its use over those whose lines are of the old rotten and rusty iron wire pattern.

For further information, call on or address

**Telegraphers'****Mutual Life Insurance Association.****INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.**

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

J. D. REID, Treasurer.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

**DIRECTIONS TO APPLICANTS.**

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing *one dollar and a half and a three cent postage stamp for each application*, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage: and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

IMPROVED TELEGRAPH INSTRUMENTS,

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed. His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them. Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-400th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

#### PRICES.

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	18 00
Main Sounders same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package.

He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers prices.

VOL. I

## SCIENTIFIC.

### A New System of Telegraphing.

TONAWANDA, N. Y., August 31, 1868.

A remarkable and extraordinary discovery has taken place in this small town, that bids fair from its nature to accomplish a great revolution in telegraphy, and, in fact, in all existing systems of communication. The discoverer, Mr. J. H. Mower, has allowed me to furnish the following account of his experiments and aspirations, which is his first disclosure of his important secret:

About the time that the Atlantic cable was in its incipient stages of success, and by way of diversion Mr. Mower turned his attention to electricity as a communicating agent and subjected it to minute examination in this direction. He noted the enormous expenditure that was made in laying the Atlantic cable and sought to obtain some cheap and desirable conductor. Everything that was susceptible of a high degree of electricity was brought into requisition, and he continued his investigations for upwards of six months. He then, having exhausted all magnetic concrete bodies, resorted to the electricity of Franklin, lightning, electricity, too, in its most powerful and dangerous form. From time to time, as nature afforded, he sought to mould it to his use by different combinations. He used a substance of high conductability and received the lightning and discharged it into water. He observed the decomposition of the water by this powerful chemical agent, and resolved, by artificial means, to generate a current great in intensity and profuse in quantity. To this end, by a curious and ingenious method of uniting the Voltaic pile of great producing power with an electrical machine of his own construction, a fluid of astonishing qualities was emitted, possessing all the desirable requisites to a quick and thorough decomposition of water. It now became necessary to test the efficacy of this combination for purposes of communication, and accordingly a reservoir twenty-five feet long and six feet deep was built, and the different portions of the apparatus were immersed. A series of experiments showed that a succession of distinct electrical shocks would, without regard to external influences, decompose the water in a straight line of transmission at a uniform depth from the surface, separating the water into its constituent elements, oxygen and hydrogen, from one end of the reservoir to the other. The transmission was instantaneous—so quick, in fact, that its transit could not be measured by the smallest division of time. Having thus far been successful in establishing such encouraging results, he caused to be made an instrument to receive the chemical ingredients as decomposed and measure them successively as transmitted, both in weight and volume; and their quantitative relations to each other being known (oxygen to hydrogen as one to two in volume and as eight to one in weight), he easily tabulated a set of signals by which at last was secured intelligible, facile and rapid communication. This evolution is known among chemists as the electrolysis of water, though, of course, it is greatly modified. This, then, was his discovery in miniature.

The limits of the farm house were now too small for the advanced state of his operations, and he soon collected his material and set out for Buffalo to make his experiments upon an enlarged plan in the waters of Lake Ontario. He remained there until the 17th of June, 1868, and it became necessary for him, in order to effect his new purpose, to take into his confidence a gentleman whose scientific attainments would assist him in such matters of astronomy as would be requisite to find the most exact degrees of latitude at the termini of a line parallel to the equator, and, therefore, to have each point bear from the other due east and west. For the western terminus of this line a point near the city of Toronto, C. W., was selected, and its latitude was found to be 48 degrees 38 minutes 28 seconds north. Several days were spent in reducing a set of intricate astronomical observations to the extreme delicacy of finding the latitude to inches on the surface of the earth. This being done they went to the eastern end, in the town of Sandy Creek, Oswego county, in this State, and located it with the same degree of precision as in the first instance, not neglecting to verify both by accurate surveys. The line joining these two points is about one hundred and thirty miles long, and is, as before stated, due east and west. The apparatus was then immersed at a considerable distance from the shore in twenty-five feet of water, and was protected from the violence of the waves and currents by temporary wooden bulkheads completely surrounding it.

Accompanied by your correspondent the experimenter went again to the western station, and the other portion of the apparatus was sunk in the same depth of water (when uninfluenced by the tide) and upon the same mathematical parallel of latitude. It was likewise protected by a wooden casing. Reservoirs of sheet iron construction, of forty cubic feet capacity, were placed at each end and properly adjusted to receive and measure the constituents as they should be resolved to conform to the previously codified signals by which the electrical effects were to be interpreted. On the 6th day of July everything had been arranged with scrupulous care, the various parts of his battery, machine and connecting apparatus were appropriately adjusted and the final trial commenced. A dozen fruitless attempts were made to make the instruments perform their offices. At last the various parts were brought up for inspection and the fault was soon discovered and the co-worker was duly informed by telegraph. Three days passed, and on Monday, the 10th of July, at two o'clock, everything was again got in position, the weather being calm and the water smooth and unagitated. A scow was secured from which to operate and was finally anchored at each end. He then commenced to generate a powerful stream and an immense quantity of the decomposing fluid, which he stood ready to let loose upon the susceptible medium, a hundred radiating agents converging to a common centre, all charged with electricity, and which were only waiting for the needed touch to speed the fluid upon its impulsive errand. At seventeen minutes past two o'clock he handled the operating screw and sent the following despatch:

J. B. SPEARMAN:

Success at last is mine.

JAMES H. MOWER.

At nineteen minutes past two o'clock back came the response:

Mr. MOWER:

The world will acknowledge your triumph.

J. B. SPEARMAN.

The theory upon which he determined to the line of transmission—a parallel of latitude founded upon the natural disposition of elect over the earth; but as to the particulars Mr. Mower declined to enlighten me, as was also the case in regard to many points of his apparatus.

As to the whole evolution of despatching messages through water, using it as the only medium, without the aid of any wire or insulating conductor, it may be explained thus: The water at the point of contact with the fluid is decomposed in the first drop, when the chemical separation advances to the second globule and there effects a like change, communicating the evolution to the third, and so on in the line of transmission, always in the same stratum of water, to the end of the series; and when positive decomposition takes place in the first, negative decomposition is evolved in the last. It will be seen at once that the quantity of electricity required to resolve the evolution is in constant proportion to the force of chemical affinity by which the elements are united, and it therefore only requires great propulsion to send the decomposed ingredients on *ad infinitum* in the direction of the promulgation of the agent effecting the same. Why this line of invariable decomposition is always east and west, Mr. Mower, as I remarked before, will not now disclose. The reason for the electricity's acting in the same stratum is explained in the unequal densities of different strata; and that the intensity of gravitation acts as well for unponderable bodies as for those of considerable weight. Nor can any salt or base, held in solution by water, deflect the line of transmission from its parallelism to the surface of still water; first, because of the laws of gravitation: and, secondly, for the reason that these bodies are themselves acted upon by magnetic influences. The only obstacles to the action of this mode of telegraphy will be the tidal waves rising and falling in the two hemispheres at different times; but these barriers can be easily surmounted by sinking the apparatus to a depth beyond their influence.

Mr. Mower called his assistant to Albany and compared the chronometers which they had in use during the trial and found that, allowing for the difference of time in the two places, the average time of transmission was less than three-eighths of a second for a distance of over one hundred miles. From this fact it is plain that some particular law governs this new discovery.

Mr. Mower has placed his legal interests in the hands of responsible parties, who are preparing his caveats which will soon be filed in Washington. He is about to sail for Europe to secure the same rights there, when he will establish a line of telegraph between Montauk Point and the Spanish coast, which, he assures me, can be done for less than \$10,000.—

Correspondence of the N. Y. Herald.

## Correspondence.

## Telegraphers' Insurance.

To the Editor Journal of the Telegraph:

In sending you the enclosed assessments and need subscriptions, I am minded to enclose also some good wishes for the success of the association in the form of a few suggestions. I cannot help feeling the deepest solicitude in regard to it, and whilst wishing it were possible to increase these few cents into as many dollars or thousands of dollars, I have been pondering over the best means of eventually arriving at complete success. The association is one of the very best I know of. Quoting a friend, who did not need to be asked twice for his name, "I think it is tip-top, for it looks as if operators had not all turned fossils." They are so selfish and indifferent sometimes that I cannot help speaking earnestly. I work myself up to a pitch of generous enthusiasm and expect to find the majority co-operate with me in some scheme for our general good, like our Insurance Association; but I met instead with such good natured, careless indifference, that I am sometimes tempted to let them be buried in Potter's Field, if they prefer it, or to let them severely alone for the future. Have you met with no such instances, no such replies as: "Oh, my life ain't worth that!" "My good fellow I would, but I'm broke." "Yes, sometime, not now." "Very good thing, but how many will die yearly, do you know?" or a dozen other replies equally as exasperating. It seems marvellous that they cannot see it at a glance, and so make it needless to urge them to what is their own advantage. Every little while somebody pays out in charity sums they never expect to see returned, and the known prospect of an assessment, much smaller, seems a terrible burden, when it is sure to be returned. They forget the object, that is all. Here, one suggestion I have to make, is *appropos*. These assessments might be much more equally divided and be made much lighter, thereby if each member was assessed a percentage on salary instead of any stated sum. For instance, one per cent. on one month's salary would be proportionate. A salary of fifty dollars would scarcely feel the deduction of fifty cents. Collection could be made with more speed, ease and accuracy were the Superintendents to take this, as a trifling charitable burden, upon themselves in each of their districts. Besides this, it seems to me the mode proposed of paying up a liability is a trifle faulty. For instance, in case of a death where collections—as in our migratory hard-to-get-at fraternity—are not prompt or fail entirely, the stipulated fund, of course, is lessened. Would it not be advisable, as the association grows and its property accumulates, to have its property in a fund to guard against contingencies of this kind, and have the assessments in the proportion of a dollar, or one per cent. on salary, to each member? This is not mentioned, I believe, at all. I am convinced that this provision will be found necessary in time. I will not trespass upon your time and space farther, although I am in the mood to continue indefinitely, but I would very much like to have you tell me what you think of my gratis advice.

Believe me, always,

Yours sincerely,

LOGANNE.

BUFFALO, N. Y., August 5, 1868.

To the Editor Journal of the Telegraph:

DEAR SIR:—We have several "Hicks' Repeaters" here, and are frequently troubled with weak extra locals. Suppose a set at work and a weak extra local on the west side, the east sending; can you inform us what causes the west side to sputter and break back? It is natural to suppose that the extra local being weak, the main circuit magnet would have more power over the armature and keep it closed.

A reply through the columns of the JOURNAL will oblige many of the operators, and

Yours truly,

S.

The extra local on the west gains in strength during the moment that the eastern main and western extra local circuits are open, and at the instant these circuits are closed, acts with more than its average power. This momentary strength which passes off at once is sufficient to overcome the strength of the western main circuit on the western relay for an instant, thus causing the breaking back and sputtering.

WESTERN UNION TEL. OFFICE,  
August 6th, 1868.

To the Editor Journal of the Telegraph:

Will you please explain through the columns of the JOURNAL the following: During a recent thunder storm I was sitting about two feet distant from my instrument and local battery, when a report and flash occurred directly over my register, equal to the report from a small pistol—did not notice any lightning within the space of three minutes, either before or after the occurrence—felt no shock except when I sit on my chair after jumping about fifteen inches straight up in the air. Please explain and oblige,

YOUNG OPERATOR.

If "young operator" was shocked because he "sit" in his chair "after jumping about fifteen inches straight up in the air," we really cannot see why. But if he asks if a shock may be received strong enough to make an operator jump like a kitten before a bee-hive without hearing thunder or seeing lightning, we think it quite likely. Perhaps the flash and the jump were so synchronous that the astonishment of the power acting on young operator's understanding was so great as to make him oblivious to its cause. Heavy shocks are often felt when the cause is distant, or otherwise unobserved.

CHICAGO, September 4, 1868.

To the Editor of the Journal of the Telegraph.

In your issue of September 1, you give a sketch and explanation of Mr. Frey's Self-Closing Key, and say "all that is necessary is to deaden the ordinary anvil of the sounder and read from the back stroke." Should such a system come into practical use, why not reverse the local points in the relay and close the local circuit by the back stroke of the relay armature?

WESTERN.

Quite right friend "Western," and something more. This plan would save local batteries all action when the line is not in use, as the local circuits would be held open by the relay magnet armature. We confess to having given little attention to this discussion except as a pastime, but see that there is in it something worthy of more careful attention.

#### Curious Discovery in Medicine.

Dr. Humboldt, nephew of the late illustrious German, in his practice at Havana, has ascertained that the poison of the scorpion tribe is a remedy for yellow fever. He inoculated two thousand four hundred and seventy-eight men of the military and naval garrison; six hundred and seventy-six afterward caught the fever, of whom not more than sixteen died. A distinguished Frenchman, M. de Gasparin, having heard of the facts cited by one Dr. Desmarts, communicated to him a fact in his own experience. He had long been afflicted with rheumatism, which kept him almost constantly infirm. One day, in picking up a handful of weeds in his garden, he was stung by a wasp on the wrist. The arm swelled; but the rheumatic pain disappeared. Seeing this result, he caused himself to be stung the next day along the seat of pain in his leg, and was again delivered from suffering, and was able to walk with ease. This happened three years ago, and every subsequent reappearance of the malady has been cured by similar means; and by a wasp-sting on the neck of M. de Gasparin an attack of bronchitis was overcome.

#### Hill's Battery.

To the Editor Journal of the Telegraph:

DEAR SIR—As it has ever been much thought of and talked about as to what is the *best* and *cheapest* main battery for working our Morse lines, will you permit me space enough to present my experience for the last two months with the "Hill's" battery. The months of April and May have been remarkable for frequency of severe lightning and heavy rains. I have worked this line, 180 miles in length, with thirty magnets constantly in circuit, with 123 cups of "Hill's" battery, sixty at one end and sixty-three at the other, at an expense for the two months of \$3.26, being actual cost of Sul. copper used. Our line is insulated with the "Wade" insulator, with the exception of about 100 Brooks' four inch improved insulator, and we have invariably worked the whole circuit in and through every storm with ease.

MILWAUKIE.

PROFESSOR TYNDALL, in his lecture on "Vibratory Motion" at the Royal Institution, illustrated the very low conducting power of hydrogen for sound by a novel experiment. A bell struck by clockwork was placed under the receiver of an air pump, and the air exhausted as perfectly as possible. By applying the ear close to the glass a faint sound could still be heard. The exhausted receiver was then filled with hydrogen, when the bell was again heard to sound, but faintly. On pumping out the hydrogen all trace of sound ceased, even when the ear was placed close to the receiver. Hydrogen being about fifteen times lighter than air, it might be supposed that its low conducting power arose from its tenuity. But such is not the case; the conducting power of air, rarefied fifteen fold, and therefore of the same density, exceeds that of hydrogen in a marked degree.

#### Patents.

60,452.—TELEGRAPH INSTRUMENT.—Paul Antoine Marie Chavassaignes and Jacques Paul Lambrigt, Paris, France.

We claim, 1st, The combination of the devices herein described for effecting the notation and automatic transmission of telegraphic messages, the same being constructed and arranged to operate in the manner and for the purposes set forth.

2d. An insulating-link, composed of the ingredients herein named, taken in the proportions substantially as specified.

3d. A decomposable liquid, made of the ingredients herein named, taken in the proportions substantially as specified.

60,298.—TELEGRAPH INSTRUMENTS.—George Little, Hudson City, N. J.

I claim, 1st, The combination of a pen with a reservoir.

2d. The combination of a pen, reservoir, and coil.

3d. The combination of a pen, reservoir, and coil, with paper properly actuated.

4th. The combination of a pen, reservoir, and properly moved paper.

5th. The combination of a pen, float, and reservoir, and a. of these in combination with coil, and all of these also in combination with properly actuated paper.

6th. The combination of a pen and a reservoir, having an opening therein for the protrusion of the pen, with air-gluing tube, and all of these in combination, first, with a float, second with a coil, and third, with properly actuated paper.

7th. The combination of a pen with a reservoir of fluid and a permanent magnet properly located, and all of these in combination, first, with a float, and second, with a coil, and thirdly with both a coil and float.

8th. The combination of a pen, a reservoir, and a coil, when the reservoir is vertical and provided with an opening at the bottom thereof, and the pen passes through the opening, and the coil surrounds the vertical reservoir, and these parts thus relatively arranged in combination with a regulating tube.

9th. The combination of a pen, a vertical reservoir, open at bottom, a coil surrounding the reservoir, and a permanent magnet, located above the reservoir, and all these parts thus relatively arranged, in combination with a permanent magnet, located below the reservoir and pen.

10th. The combination of the following parts, viz., a pen, a float, a reservoir of fluid, a regulating tube, a coil, a paper properly actuated, and these in combination with a permanent magnet, so located as to influence the pen, all these combinations, and the parts or elements making up the combinations, being substantially such as herein specified and set forth.

**The Brooks' Insulator in England.**

Early last year it was announced that Monsieur Vicomte de Vougy, Director General of the Telegraph Lines of France, had appointed a commission of Electricians to decide upon the style and material of an insulator for telegraph lines under his charge. This commission was composed of eminent electricians, among whom were Messieurs Gauguain Gavorect, Du Moucel and others, whose names are familiar to all readers of works on electrical science. The most approved insulators of the different countries in Europe were procured and tested in the open air, exposed to the weather. Among others presented for trial was that of Mr. Brooks. After three months of trial, an order was given, on October 1, 1867, to Mr. Brooks for a sufficient number to enable the commission to make a practical test of their value. The result of this examination and test was made known through the columns of the *Semaine Financière* of January 24, and *La Union* of February 4, stating that the Brooks had proved far superior to all its competitors.

The English Telegraphers hearing of the success of this Insulator, sent to Philadelphia for samples to test in comparison with their own in the fogs and mists of London.

A table of results, which has just been received, speaks for itself, and shows that the merits of this instrument are not lost by a change of climate or a transfer to hands in no wise interested in their development or exhibition.

We were present lately at a series of tests of the Brooks and other Insulators, made in this city April 27, 1868, which fully confirmed the results obtained at Silverton. The testing instruments employed were a set of resistance coils, made at the Silverton Works, and a Ruhmkorff Galvanometer of admirable construction, whose delicacy was such that the contact of one finger, with a brass bending screw at one terminal, while a finger of the other hand rested on a copper wire at the other terminal, deflected the needle several degrees. The results are reduced to ohms of resistance to make them comparable with the Silverton experiments, in which a far more sensitive galvanometer was employed, and a more powerful battery.

The constant of the galvanometer was first determined by passing the current of one of the sulphate of mercury cells described by Mr. Chester, p. 257, of our last volume, through a resistance of 10,000 units or ohms and the instrument. This gave an actual constant for one cell of 6,160°, or for the entire battery of 151 cells, afterwards employed, of 930,160°.

One pole of the battery being then connected with 88 Brooks insulators, and the other through the galvanometer to the earth, a deflection of 8° was observed, giving for each insulator a deflection of  $\frac{8}{88} = \frac{1}{11}$  of a degree, which represented a resistance under the conditions described above, of 102,817,600,000 ohms.

At the same date, a trial was also made with 22 earthenware insulators, charged with paraffine by the same method as for the other insulators. The deflection in this case was 17° or  $\frac{17}{22}$  per insulator, which being reduced as before, gives 12,087,365,902 ohms.

There was then immediately a trial made with 22 glass and bracket insulators, the kind generally employed in this country.

The deflection here measured was 7852°, or 356  $\frac{1}{11}$  per insulator, showing a resistance in ohms of 2,605,000.

The atmospheric conditions under which these experiments were made were as follows: It had rained steadily on the 20th and 21st until evening, when a fog formed and continued until 8 A.M. of the 22d, when the deflections were greatest, and were measured as before stated.

The Silverton tests on March 31st, the time of greatest deflection, reduced to ohms, stand as follows:

United Kingdom Tel. Co.'s large porcelain ..	4,087,500
Varley's double porcelain cup .....	3,270,000
British and Irish Mag. Tel. Co.'s porcelain ..	2,725,000
United Kingdom Tel. Co.'s small porcelain ..	3,270,000
Brooks' patent .....	40,875,000,000
" " .....	40,875,000,000
" " .....	168,500,000,000
" " lug for crossarm .....	54,500,000,000

Several points are here worthy of remark. First, the English tests give a higher actual resistance for the Brooks instrument than those made here. This is undoubtedly due to a better state of the weather. Such a favorable condition for putting to test the efficiency of insulators, as was furnished on April 22d, is, fortunately for the telegraph company, not often to be met with. Again we see that the various English insulators tested were ahead of our usual glass and bracket, while these in their turn were left, each further in the rear, by the Brooks apparatus.

The constant of this galvanometer made by Ruhmkorff, is, as we have already seen, 6160°, with a single cell through 10,000 ohms, while that of Prof. Thompson, used in the Silverton tests, has a constant of 835° through 1,000,000 ohms, or 100 times the resistance, thus showing that the delicacy of the English instrument was five times as great as the French.—*Journal of the Franklin Institute.*

**Telegraphers' Mutual Insurance Notice.**

To the Editor Journal of the Telegraph :

The officers of the Insurance Association announce by direction of the Executive Committee, that the restriction hitherto placed upon application from the Gulf and extreme Western States, has been removed, and hereafter any applicant, if otherwise eligible, will be received regardless of his or her place of residence. This is done that the benefits of the Association may be as widely diffused as possible and that all may have an opportunity to share in its advantages. It is hoped that the managers and superintendents throughout the South and West will call the attention of their operators and clerks to this notice and to the advertisement constantly published in this paper.

THE Western Union Telegraph Company will erect nearly 6,000 miles of wire before December next, without satisfying half the calls made upon it, so great is the demand of the present year for the means of communication.

**Discovery of Galvanism.**

In the whole history of accidental discovery, there is no event more remarkable than that by which that other form of electricity, known as galvanism, was brought to light. To quote M. Arago: "It may be proved that this immortal discovery arose in the most immediate and direct manner from a slight cold with which a Bolognese lady was attacked in 1790, for which her physician prescribed the use of frog broth."

In accordance with the medical advice, a number of frogs were prepared for stewing, and by some chance a few of them were laid on the table near an electrical machine, in the laboratory of Galvani, professor of anatomy at Bologna, and husband of the lady in question. An assistant working in the apartment had occasion to draw sparks from the machine, and each time that he did so, Signora Galvani observed that the limbs of the dead frogs moved as though alive. She called the professor's attention to the fact; he repeated the experiment, and with the same result. But without intending it, he went farther than this, and found that the limbs of frogs could be excited as well by means of good conductors as by a machine. The power was present, and required only an efficient cause to develop its action. Galvani, it is said, having prepared the hinder

halves of several frogs for anatomical investigation, "passed copper hooks through part of the dorsal column which remained above the juncture of the thighs, for the convenience of hanging them up till they might be required for the purposes of experiment. In this manner he happened to suspend several upon the iron balcony in front of his laboratory, when, to his inexpressible astonishment, the limbs were thrown into strong convulsion." On examining further into the phenomenon, he ascertained that it could be produced at pleasure by touching the surface of a nerve and of a muscle at the same time with a metallic conductor; and arguing from the whole body of facts that came within his experience, he propounded a theory of animal electricity which for some time dazzled the imaginations and stimulated the enthusiasm of a host of partisans, according to whom the existence of a "nervous fluid" had been demonstrated by the experiments.

**Substantial Honors.**

At Napoleon's invitation, Volta visited Paris in 1801, and explained and illustrated his theory of contact of metals and electro-motive action to the members of the Academy of Sciences. The First Consul was one of the audience; and "when the report of the committee on the subject was read, he proposed that the rules of the Academy, which produced some delay in conferring its honors, should be suspended, and the medal immediately awarded to Volta as a testimony of the gratitude of the philosophers of France for his discovery. This proposition being carried by acclamation, the hero of a hundred fields, who never did things by halves, and who was filled with prophetic enthusiasm as to the powers of the pile, ordered two thousand crowns to be sent to Volta the same day from the public treasury, to defray the expenses of his journey."

**A European National Telegraphic Congress.**

An important meeting has lately been held at Vienna, under the title of the International Telegraphic Conference. The object of the meeting was to resettle the system of telegraphic communication between Europe and the East.

The position occupied by England at this Conference, says the *Pall Mall Gazette*, may be gathered from the official report of the remarks of Colonel Goldsmid, at the sitting of July 13. Colonel Goldsmid asked that measures should be taken to assure to the Indian despatches a more prompt and regular transmission. He said that if the English delegates had not offered a formal amendment to this effect, it was because they had only at the very last moment received notice of the decision which permitted them to take part in the conference, and because they had no knowledge of the proposals of the various governments until after their actual arrival at Vienna.

The *Pall Mall Gazette* adds: "If we are to be thus left out in the cold in international congresses, might it not be well to take our own parts, and lay a direct deep-sea line for ourselves?"

**FREY'S SELF-CLOSING TELEGRAPH KEY.**

1.—Hard Rubber Point.  
2 and 3.—Platina Point.  
4.—Guide.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address— JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, SEPTEMBER 15, 1868.

### Politics and the Telegraph.

We have received a letter from one of the most faithful and conscientious of our office managers, asking whether he can properly accept the chairmanship of a political executive committee to which his fellow citizens desire to appoint him. He himself doubts its propriety, yet his political convictions being somewhat intense, asks advice. He, however, evidently wants to "pitch in."

In this matter we must confirm his doubts, and advise a prompt declination of the offered honor. We claim for every man the right to hold manfully and fearlessly his political convictions, but there are positions in which, by the very necessities of the case, these must be held unobtrusively and delicately. The most prominent of these is the managership of a telegraph office. Both parties must use the wires to accomplish party ends and to execute political purposes. In such a position it is not in human nature to be satisfied to leave a message in the hands of the active partisan of hostile politics. It is equally hard for an active partisan manager to be entrusted with his opponents arrangements and not in some way have it sway his own movements. There is thus forced upon an office manager such a manly and discreet carriage of his sentiments as to inspire confidence and quench distrust. When Government assumes the appointments in telegraph offices we may expect to meet the Ku Kluxes of the reigning party at the telegraph counter; but until then we must keep in mind that we serve our citizens of all creeds, and bear ourselves as if having none. We must be blind as justice, and as true.

### New Telegraphs.

We publish the "new mode of telegraphing" as a part of the current telegraphic gossip. It will not do to laugh at anything now-a-days. The Tona-wanda experimenter, of modest mein and quiet manners, has the honor of our first page. The rhapsodies of the narrator we omit. We await the grand experiment between Spain and Montauk Point. By the way, what has become of the man who established the frog telegraph? He was said to have had one intelligent no-tailed toad on the American and an equally enlightened froggy vertebrate on the trans-Atlantic coast. When one of these yellow gentlemen winked his eye, the other did ditto. So, also, when he gaped or shook his sides or said *ke chunk*. And thus a series of signals were to be arranged. The closing of the right eye was to mean "Seward med, look out for war." The shrug of the left shoulder was to mean "keep dark and buy all you can." How convenient such a system would be need not be stated. Frogs would be the pets of the world.

Well, we invite Mr. Mower to call and enlighten us. It has long been known that water can be used as a part of a circuit. Good currents have been obtained across a river without wire many years ago. Who knows how many Reapers may result from this new Mower.

### Operators' Life Insurance.

A young, handsome, flaxen-haired lady came into our sanctum a few mornings ago, full of enthusiasm for the success of the Operators' Insurance Association. She only needed the possession of that wonderful alembic in which so many puzzles are solved, a long and full purse, to have provided a magnificent death fund for all her associates on the spot. It was quite animating to see the flaxen ringlets and the long *suivez moi jeune homme*, toss themselves in the animation of the mutual conversation. Were all the members equally anxious, and each existing member would send in two new names, it would make the organization a handsome success. Indeed there seems reason to believe that it will soon be a success any way. A number of new applicants have been added to the organization and more are coming.

On another page will be found an article by our enthusiastic and warm-hearted visitor under the *nom de plume* of Loganne. There is a very wise and practical suggestion in it very wonderful to have come out of such a gay and pretty little head. It is wonderful how much philosophy sometimes wings itself from beneath so small a bonnet. Loganne proposes, which we second, that assessments be made on incomes instead of by arbitrary amounts. Thus an operator receiving \$50 per month, would pay 50 cents when a death occurred, while one receiving \$100 per month, would pay \$1. Were the District Superintendents to become sub-treasurers, and all operators enter into such a system, it would provide a large and handsome fund at death to each.

There is one drawback to this. As numbers increased, the exposure to assessments would increase also. Yet we would be glad to see it inaugurated. Personally, we desire every operator insured, even were he in the last stages of decline. We want to see and feel that something warm and generous and fraternal binds the members of the profession to each other.

### Courtesy.

Under this caption the editor of this paper is accused of discourtesy to a cotemporary. We certainly never received anything from the source of the accusation under its present editorship to elicit any peculiar respect. We have been rarely mentioned by it except in ridicule, and the paper we edit never but in terms of contempt. This is true of the very issue in which "Courtesy" is a caption. It is the last caption which should ever appear under such a guidance.

The advertisement, non-publication of which is complained of, was handed to a lad in the office in our absence, who advised us by telegraph of the fact. It was ordered printed, and placed in the editorial page, although the paper was made up. On learning subsequently, however, that it would occupy a column, we had to order its publication omitted.

On our return the lad who received it knew nothing of any desire to have the advertisement appear in a later number, and its nature suggested otherwise. We received no note or request of any kind respecting it, and when the day for publication came, it was omitted although all ready for use. This is the extent of our sinning, which we only state for those who may be surprised at the accusation.

MR. FREY'S KEY, the advertisement of which appears on the third page, has been modified by the combination of the guide and anvil, so as to make the former as it appears in the cut, unnecessary. A perfect, simple, homogeneous, trunnionless key is thus supplied. By changing the points of the receiving magnet, the local batteries are kept from action, except when in actual use. These are valuable accomplishments and deserve attention.

### The Electric Telegraph.

Eloquent, though all unheard,  
Swiftly speeds the secret word,  
Light or dark, or foul or fair,  
Still a message prompt to bear:  
None can read it on the way,  
None its unseen transit stay.  
Now it comes in sentence brief,  
Now it tells of loss and grief,  
Now of sorrow, now of mirth,  
Now a wedding, now a birth,  
Now of cunning, now of crime,  
Now of trade in wane or prime,  
Now of safe or sunken ships,  
Now the murderer outstrips,  
Now it warns of falling breath,  
Strikes or stays the stroke of death.  
Sing who will of Orphean lyre,  
Ours the wonder-working wire!

THE discovery of the loss of a package of editorial and other matter on its way to the printer, unknown to us until the last moment, must apologize for any infelicity in arrangement and imperfection in either style or matter. We prefer to let the paper go as it is to delaying the usual period of publication.

### Curious Effect of Lightning.

The following singular fact has been communicated to the French Academy of Sciences by M. A. Robierre, a well known physicist. In August the city of Nantes was visited by a violent storm. Flashes of lightning followed each other in quick succession, and a gentleman who happened to be crossing one of the bridges of the Canal de Bretagne at the time, suddenly found himself enveloped in a blaze of light. The phenomenon lasted little more than a second, and caused no unpleasant effect. On returning home the informant, having occasion to count the money in his purse, arrived at the conclusion that he must have received a piece of fifty centimes instead of a half-Napoleon. But, on a closer investigation, he discovered, to his astonishment, that the piece of money he had taken for silver was really the gold one, but covered with a thin film of silver. The following is the explanation given by M. A. Robierre of this this strange occurrence. The half-Napoleon had been put into the compartment of the purse adjoining that containing silver coin. The electric fluid volatilized part of the latter metal, which, in this state, had penetrated through the leather partition and deposited itself on the gold piece with remarkable uniformity. This is the first time such an effect has ever been observed.

An advertisement in the *London Times* seriously announces a new song, with the modest request, "Oh, give me back but yesterday!" A companion to the above, "Oh, could you spare to-morrow, love?" is in preparation; to be afterward followed by the sequel lyric of "You haven't got such a thing as next week about you, have you?"

M. JOSE CACERES has received exclusive right to lay a cable between Mexico and the Spanish Antilles.

## BASE BALL.

## The North Bends and Night Owls.

CINCINNATI, September 9, 1888.

To the Editor Journal of the Telegraph:

Bad sixpences are proverbial for turning up. As I feel worth just about ten cents this morning, I believe I will turn up for the benefit of all concerned.

Acting upon your suggestion, the day and night operators of the Western Union office here each formed themselves into a Base Ball Club, and have had several tilts together, the Owls coming out victorious after hard contested fights. On Monday last the night men proceeded to Cleves, Ohio, where Mr. Williams resides during the summer months, and played a game with the North Bend Club of that place. The telegraphers, who played remarkably well for beginners, again led the score, which I subjoin and which included clean home runs by Superintendent Williams and Charlie Scott.

Umpire—J. W. Warner, Cincinnati B. B. C.

What fun the boys did have and how they did enjoy their fresh bread, cheese and pure milk eaten under the shade of the giant oaks which abound in such numbers round the pretty village of Cleves. And what a laugh we did have when on our arrival at Delhi we contrasted Scotty's six feet odd inches surmounted by several more inches of "beaver," with the slight form of Charlie Best, the operator there, who stands three feet five inches in his boots and weighs fifty-four pounds. He is, however, a good, sound operator and a perfect little gentleman.

But to another topic. Messrs. Gilliland & Scott of this office have opened an establishment here for the manufacturing and repairing of telegraphic and electrical apparatus. As they are both old telegraphers and experienced electricians they will doubtless succeed, as the Queen City furnishes a good field for an institution of this kind. The firm is also engaged in the manufacture of a new instrument, invented by Mr. Gilliland, and designed to be used by business firms. A two mile circuit has already been placed in successful operation for the firm of Proctor & Gamble. Several others are in process of construction. This instrument is very highly spoken of, being an improvement on the dial telegraph now in use, and with a few minutes instruction a person can send at the rate of seven and eight words per minute.

Ed. M. Harris, Ellis Wilson and Charlie Lithgow have accepted situations with the Western Union Company here, while Mr. Doan has resigned for the purpose of entering other business. Lee Hensley, formerly of St. James Hotel office here, has been given a berth on Minnesota Valley lines at St. Paul. Mr. J. D. Watt, his successor, on being asked "134" the other day, replied "Watt." Mr. Inquisitive still undecided, again asked: "Watt (what) did you say?" As they can't get that "what" through each others heads, they are probably "fighting it out on that line" yet.

Yours, as ever,

VOYAGEUR.

WE have published during several numbers testimonials of the merits of the Brooks' insulator, furnished us by the inventor. In this number additional testimony appears from sources entitled to weight. Devotion to a single end, intelligently pursued, is usually successful. We want to see perfection attained in this troublesome department, and the recognition of some insulator as a standard.

OFFICE OF S. S. LOW'S REPORTING TELEGRAPH.  
18 NEW STREET, NEW YORK.  
August 7th, 1888.

D. BROOKS, DEAR SIR:

We have used your patent Paraffine Insulator upon our lines in this city with the most satisfactory results. The nature of our system and the character of the business transacted by us, are such as to render the absolute insulation of the wires a matter of the utmost importance, and the perfection of the insulator in this respect leaves nothing to be desired. Our largest circuit of about a mile and a half when tested in a heavy rain storm, with 25 cups of carbon battery, gave no perceptible leakage upon the galvanometer.

Yours truly,

FRANK L. POPE, Supt.

86 Liberty Street.

## The Tidal Wave on the North Pacific.

On the 31st of August there was a telegram received from San Francisco as follows:

On the 15th instant, a singular tidal phenomenon occurred off San Pedro, Southern California. A series of waves commenced flowing upon the coast, causing the tide to rise 63 or 64 feet above the ordinary high water mark, which was followed by the falling of the tide an equal distance below the usual low water mark. The rise and fall occurred regularly every half hour for several hours.

Of course the cause is now clear. These waves were started by the great earthquake in Peru, and must have traveled nearly 4,000 miles within the two days or less that intervened between the shock in Peru and the effect in California—that is, nearly 109 miles an hour.

CHARLES DICKENS once said: "There is nothing—no, nothing—beautiful and good that dies and is forgotten. An infant, a prattling child, dying in its cradle, will live again in the better thoughts of those who loved it, and play its part, though its body be burned to ashes or buried in the deepest sea. There is not an angel added to the hosts of heaven but does its blessed work on earth in those who loved it here. Dead! Oh, if the good deeds of human creatures could be traced to their source, how beautiful would even death appear!—for how much charity, mercy and purified affection would be seen to have their growth in dusty graves."

## AMERICAN COMPOUND TELEGRAPH WIRE.

SUPERIOR CONDUCTIVITY,

LIGHTNESS AND DURABILITY.

A MOST IMPORTANT INVENTION.

We would call the attention of Officers of Telegraph Companies, Telegraph Builders and Contractors, and the Public, to the new

PATENT COMPOUND TELEGRAPH LINE WIRE.

Manufactured by the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY,  
OF NEW YORK.

This Wire has already been put up on sections of several Telegraph Lines, and its merits fully tested, and the results show that it combines all the good qualities which are claimed for it, viz., Economy, Superior Conductivity, and Increased Strength, with Decreased Weight of Metal.

In its composition are used three metals, either of which is a good conductor, Steel, Copper and Tin; and the superiority of Copper as a conductor over other metals is well known, and but for its ductility rendering its permanent suspension in a pure state intact impracticable, it would have always been used exclusively as a Conductor on Telegraph Lines. By combining it with Steel the desired strength and permanence is attained, and the necessary weight of the line wires reduced two-thirds, thus obviating the necessity for using a large number of poles to the mile, and by reducing the points of contact, lessening the chances for trouble and escape of the electric fluid.

All other Line Wires must inevitably be superseded by this, and such Telegraph Companies as now adopt it will the sooner realize the advantages to be derived from its use over those whose lines are of the old rotten and rusty iron wire pattern.

General Agent.

STICKWELL & CO'S  
EXTRA MUCILAGE

THICK, CLEAR AND ADHESIVE

Who has not used

STICKWELL'S MUCILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the Parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding "or any other man." It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOURS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, 8OZ. CONE, 8OZ. FLAT, 8OZ. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES

S. S. STAFFORD,  
Sole Proprietor, Y

### The Spot in the Sun.

The existence of a large spot in the disk of the sun was mentioned in the *Evening Post* a few days ago.

The length of the spot was 5,500 miles, the black portion extending for 24,000 miles; or, to give a more familiar idea of its magnitude, two planets, each as large as our earth, could have been engulfed within this chasm without squeezing. The periphery of the central spot was mottled with black and gray dots.

The lithograph has a very curious appearance, somewhat resembling a capital Q, or a comet with a curled tail surrounded by an infinite number of small specks of a grayish tint.

### TARIFF BUREAU.

#### Semi-Monthly Circular.

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York.  
September 15, 1888.

To all Offices on W. U. Lines—

The following changes have occurred since Sept. 1, the date of the last Tariff Order. Please note them in your Tariff Book:

#### NEW OFFICES.

Adair, Iowa, tariff same as Boone, Iowa.  
Afton, Iowa, tariff same as Scranton, Iowa.  
Alburtis, Pa., tariff same as Millerstown, Pa.  
Benton Harbor, Mich., tariff same as St. Josephs, Mich.  
Charlemont, Mass., tariff same as Greenfield, Mass.  
Cohasset, Mass., tariff same as heretofore.  
Davidsburg, Mich., tariff same as Holly, Mich.  
De Soto, Iowa, tariff same as Des Moines, Iowa.  
Dexter, Iowa, tariff same as Des Moines, Iowa.  
Durant, Iowa, tariff same as Wilton, Iowa.  
Frankfort, Ky., tariff 50 more than Atchison, Ky.  
Hoosac Tunnel, Mass., (east side) tariff same as Greenfield, Mass.

Irontdale, Mo., tariff same as Bismarck, Mo.  
Lowmoor, Iowa, tariff same as Dewitt, Iowa.  
Millville, Ind., tariff same as Hagerstown, Ind.  
North Granville, N. Y., tariff same as Comstock, N. Y.  
Quarry, Iowa, tariff same as Marshalltown, Iowa.  
St. Josephs, Mich., tariff 10 more than Niles, Mich.  
San Jose, Ill., tariff same as Delevan, Ill.  
South Dennis, Mass., tariff same as E. Dennis, Mass.  
Sulphur Springs, Ind., tariff same as New Castle, Ind.  
Summitt, Iowa, tariff same as Panora, Iowa.  
Sycamore, Ill., tariff same as Courtland, Ill.

#### OFFICES OPENED ON OTHER LINES.

Dundee, Quebec, tariff 25 and 2 from Montreal, Quebec.  
Check same point as business for Montreal.  
Houlton, Me., tariff 20 and 1 from Woodstock, N. B. Check Woodstock.

#### OFFICES CLOSED.

East Dennis, Mass., Middleville, N. Y., Newport, N. Y.,  
Sykesville, Md., Weehawken, N. J., Elk Mountain, Dac.,  
Velonia, Ind., and Locke, N. Y. Business for East Dennis,  
Mass., will be delivered by stage from South Dennis.  
Ocean House, Rye Beach, N. H., Mt. Vernon, N. H., Craw-  
ford House, Glen House and Mt. Washington, N. H., and  
Pequot House, Conn., closed for the season. Business for  
Pequot House will be delivered from New London, Conn.;  
charge for delivery, \$1.25.

#### GENERAL INFORMATION.

Offices on the lines heretofore known as the I. and M. and C.  
and M., will add the following to their list of offices of the  
Western Union Company:

Bronsons, Mich.,	tariff from Chicago, 65;	from St. Louis, 155
Clayton, Mich.,	" " 65	" " 155
Clymer, N. Y.,	" " 165	" " 150
Columbiana, O.,	" " 115	" " 135
Emlenton, Ind.,	" " 170	" " 195
Euclid, O.,	" " 100	" " 185

Wyandotte, Mich.,	" " 85	" " 175

Offices in the Eastern and Southern Divisions, and offices in  
the Central Division not on the I. & M. and C. & M. lines will  
add the following offices to tariff sheet dated Sept. 1.

The rates from Chicago and St. Louis will be used by offices  
in the Eastern and Central Divisions, and those from Louisville  
and Washington by offices in the Southern Division.

	Tariff from Chicago.	Tariff from St. Louis.	Tariff from Louisville.	Tariff from Wash'n.
Brighton, Ill.,	80	25	95	230
Cario, Ill.,	105	70		
Canton, Mo.,	90	70	110	250
Checaqua, Iowa,	90	80	130	250
Clinton, Wis.,	50	100	110	220
Columbia, Mo.,	110	85	135	330
Croton, Iowa,	90	75	115	215
De Soto, Iowa,	100	100	150	285
Elk Horn, Wis.,	60	105	110	220
Farmington, Iowa,	90	80	115	250
Grinnell, Iowa,	100	95	125	285
Howlett, Ill.,	80	65	90	220
Girard, Ill.,	75	60	90	225
Kewanee, Ill.,	60	85	110	230
Knoxville, Ill.,	75	75	110	235
Lagrange, Mo.,	90	70	110	250
New Cambria, Mo.,	100	75	135	330
Poplar Grove, Ill.,	60	100	110	220
Plank Road, Ill.,	35	100	105	205
Sycamore, Ill.,	45	95	110	215
Utica, Mo.,	125	85	140	345

The post-office address of Berwick, Ohio, office, is Green  
Camp, Ohio.

Stanstead, Quebec, is a Western Union office, and should be  
checked direct. The tariff is the same as to Newport, Vt.

On and after September 20th offices having "Special Sheet A"  
will check Trenton, N. J., at 25 added to "special rate" to New  
York or Philadelphia, which ever may be the lower.

WILLIAM ORTON,  
President.

### Signs of Dreams.

Dr. Hammond's *Quarterly Journal of Physiological  
Medicine and Medical Jurisprudence* contains a long  
communication on "Dreaming," from which we  
extract the following: "Lively dreams are, in general,  
a sign of excitement of nervous action; soft dreams  
a sign of slight irritation of the brain, often, in  
nervous fevers, announcing the approach of a  
favorable crisis. Frightful dreams are a sign of  
determination of blood to the head. Dreams about  
fire are, in woman, signs of impending hemorrhage.  
Dreams about blood and red objects are signs of  
inflammatory conditions. Dreams about rain and  
water are often signs of diseased mucous membrane  
and dropsy. Dreams of distorted forms are fre-  
quently a sign of abdominal obstructions and dis-  
orders of the liver. Dreams in which the patient  
sees any part of the body especially suffering indicate  
disease in that part. Dreams about death often pro-  
duce apoplexy, which is connected with determina-  
tion of blood to the head. The nightmare (*incubus  
epithalles*) with great sensitiveness is a sign of deter-  
mination of blood to the chest. 'To these,' says  
Baron Von Fechtelsleben, 'we may add that dreams  
of dogs, after the bite of a mad dog, often precede  
the appearance of hydrophobia, but may be only the  
consequences of excited imagination. Dr. Forbes  
Winslow quotes several cases in which dreams are  
said to have been prognostics: Arnaud de Villeneuve  
dreamed one night that a black cat bit him on the arm.  
The next day an anthrax appeared on the part bitten.  
A patient of Galen's dreamed that one of his limbs  
was changed to stone. Some days after his leg was  
paralyzed. Roger d'Oxtoyn, knight of the company  
of Douglas, went to sleep in good health; towards  
the middle of the night he saw in his dream a man  
infected with the plague, quite naked, who attacked  
him with fury, threw him on the ground after a  
desperate struggle, and, holding him between his  
open thighs, vomited the plague into his mouth.  
Three days after he was seized with the plague and  
died. Hippocrates remarks that dreams in which  
one sees black spectres are a bad omen."

*Fun* calls Cyrus W. a Field for enterprise.

It is said that Mr. Field contemplates purchasing a  
home on the Hudson and retiring from active busi-  
ness. We don't think Mr. Field is ready for such  
oblivion.

### Electrical Phenomena—Balls of Fire, &c.

A correspondent of the *Detroit Free Press*, writing  
from Midland, Michigan, June 15, says:

"On the night of the 14th, Sunday, we witnessed in Midland  
one of the most extraordinary exhibitions of electrical phe-  
nomena perhaps ever beheld in a temperate climate, and at so  
high a latitude. About five o'clock in the afternoon a low  
lying, long, sinuous mass of dark clouds seemed to come climb-  
ing up against the wind over the valley of the Tittibawassee  
from the southeast, meeting a light scirrhous fugitive series  
of clouds from the opposite direction, but apparently higher.

"About 11 P.M. the ball seemed to open in earnest. The  
lightning not only became constant, but four, five, six, and  
even seven flashes would shoot from different parts of the sky  
at the same time; round the horizon they chased or crossed  
each other's path like fierce serpents, from zenith to nadir they  
poured like a falling shower of meteors.

"We seemed to be about the centre of the movement. As  
some of the higher lightnings flashed along the zenith, I could  
count five or six strata of clouds betrayed by their illuminated  
edges beneath it. The whole firmament was one blazing, fiery  
mass, and forcibly reminded the beholder of the sublime de-  
scription of the Evangelist, of the period 'when the heavens  
shall pass away like a scroll, and the elements melt with  
fervent heat.' I watched at least eleven balls of fire dart to  
earth within a mile radius and an angle of less than 180 degrees  
from where I sat.

"The only casualty, and that not fatal, is the most singular  
I ever heard of. Toward the east end of Midland, James  
Spencer and his wife and child slept in an eight by ten room in  
a cottage, and a younger brother occupied the next bedroom.  
One of the flashes struck a tall pine close to the corner of his  
bedroom, and descending it leaped about twenty feet from the  
ground through the gable end of the house. Through the bed-  
room ceiling it passed, leaving a hole like a musket ball.  
Thence it struck the upper corner of the mirror hanging against  
the wall, and running down its back again pierced the glass  
with a three-eighth inch hole, and slightly shivering the frame  
made for the bed. It took hold of Mr. Spencer at the wrist,  
and winding upwards around his arm, darted across his body,  
leaving a burnt mark on his skin and a singed mark on his  
woolen shirt on its passage, and leaving him insensible. It  
next took hold of his infant, about six months of age, singed  
the hair off its scalp, knocking it also senseless, but turned be-  
fore more than frightening the mother by its side, and made for  
the next room where Johnny Spencer was lying. It tore  
through that, leaving a mark like the trace of a bullet, and  
again made for the outside. Johnny 'never even dreamed of  
it.' He was fast asleep when the screams of Mrs. Spencer  
brought Mr. Charbonneau, who, with his family, slept in the  
other end of the house, to the rescue.

"Mr. Charbonneau describes the scene as frightful, a room  
densely crowded with sulphurous smoke, a woman screaming  
for dear life, a father insensible, a child but barely breathing,  
and the prospects of fire imminent. It took two hours of cold  
water ducking and a plentiful application of internal stimulant  
to bring Mr. Spencer to consciousness, and then he did not  
know what had happened. The babe to-day breathes slowly  
and is unconscious, but its rate of pulsation is evidently on the  
increase. I visited the place this morning, and the scene is  
wonderful: the pine is riven, the end of the house all shattered  
to atoms outside, the interior distributed promiscuously about,  
and what was twenty-four hours ago a fair, sound looking cot-  
tage, is now all but a ruin. And still more wonderful, its in-  
mates are all as yet alive and promise to do well if no relapse  
sets in."

## Telegraphers'

## Mutual Life Insurance Association.

## INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

J. D. REID, Treasurer.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

## DIRECTIONS TO APPLICANTS.

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

By permission of the Western Union Company, and to avoid risk by mail, remittances may be made by an order signed by a Manager on John Horner, Cashier, New York office. Whenever practicable it is desirable this should be done.

His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their  
superiority is generally acknowledged by operators who use them.  
Aside from the advantages apparent upon inspection of these  
magnets, their acknowledged merits consist in the construction of  
the helix, which was patented August 15, 1865. This being of naked  
copper wire, so wound that the convolutions are separated from  
each other by a regular and uniform space of the 1-800th of  
an inch, the layers separated by thin paper. In helices of  
silk insulated wire the space occupied by the silk is the 1-150th to  
the 1-300th of an inch; therefore a spool made of a given length and  
size of naked wire will be smaller and will contain many more con-  
volutions around the core than one of silk insulated wire, and will  
make a proportionably stronger magnet, while the resistance will  
be the same.

## PRICES.

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	18 00
Main Sounders, same as the above, with heavy arma- ture lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	6 50

All other appliances made to order. Extra spools for replacing  
such as may be spoiled by lightning, furnished at \$1.25 each. Old  
spools taken at the price of new wire by the pound. Goods sent to  
all part of the continent with bill C. O. D. Or, to save expense of  
returning funds by express, remittance may be made in advance by  
certified check payable in New York, or Post-office orders, in which  
case we will make no charge for package.  
We have ample facilities for furnishing all other kinds of Tele-  
graph supplies at the lowest manufacturers prices.**BLISS, TILLOTSON & CO.,**

VOL. I.

## Concentrated Progress of the World.

Few phenomena are more remarkable, yet few have been less remarked, than the degree in which the progress of mankind in all those contrivances which oil the wheels and promote the comfort of daily life, has been concentrated in the last half century. It is not too much to say that in these respects more has been done, richer and more prolific discoveries have been made, grander achievements have been realized, in the course of the fifty years of our own lifetime than in all the previous lifetime of the race.

It is in the three momentous matters of light, locomotion, and communication that the progress effected in this generation contrasts most surprisingly with the aggregate of the progress effected in all generations put together since the earliest dawn of authentic history. The lamps and torches which illuminated Belshazzar's feast were probably just as brilliant, and framed out of nearly the same materials, as those which shone upon the splendid *fetes* of Versailles when Maria Antoinette presided over them, or those of the Tuilleries during the Imperial magnificence of the First Napoleon. Pine wood, oil, and perhaps wax, lighted the banquet halls of the wealthiest nobles, alike in the eighteenth century before Christ and in the eighteenth century after Christ. There was little difference between the lamps used in the days of the Pyramids, the days of the Coliseum, and days of Kensington Palace. Fifty years ago, that is, we burnt the same articles, and got about the same amount of light from them as we did five thousand years ago. Now, we use gas of which each burner is equal to fifteen or twenty candles; and when we wish for more can have recourse to the electric light or analogous inventions, which are fifty fold more brilliant and far-reaching than even the best gas.

All the advance that has been made in these respects has been made since many of us were children. We remember light as it was in the days of Solomon; we see it as Drummond and Faraday have made it.

The same thing may be said of locomotion. Nimrod and Noah traveled just in the same way, and just at the same rate, as Thomas Asaheton Smith and Mr. Coke of Norfolk. The chariots of the Olympic Games went just as fast as the chariots that conveyed our nobles to the Derby, "in our hot youth, when George the Third was King." When Abraham wanted to send a message to Lot he despatched a man on horseback, who galloped twelve miles an hour. When our fathers wanted to send a message to their nephews, they could do no better and go no quicker. When we were young, if we wished to travel we thought ourselves lucky if we could average eight miles an hour—just as Robert Bruce might have done. Now, in our old age, we feel ourselves aggrieved if we do not average forty miles.

The same at sea. Probably, when the wind was favorable, Ulysses, who was a bold and skillful navigator, sailed as fast as a Dutch merchantman of the year 1800, nearly as fast at times as an American yacht or clipper of our fathers' day. Now, we steam twelve and fifteen miles an hour with wonderful regularity, whether wind and tide be favorable or not; nor is it likely that we shall ever be able to go much faster. But the progress in the means of communication is the most remarkable of all. In this respect Mr. Pitt was no better off than Pericles or Agamemnon. If Ruth had wished to write to Naomi, or David to send a word of love to Jonathan when he was a hundred miles away, they could not possibly have done it under twelve hours. Nor could we to

our friends 30 years ago. In 1868 the humblest citizen can send such a message, not a hundred miles, but a thousand, in twelve minutes.—*Spectator*.

THE French transatlantic telegraph seems to meet with unexpected difficulties. Napoleon III. has refused to permit M. Vandal, the director-general of the French post, to become one of the directors of the company. It is also feared in Paris that the intimate connection with the enterprise of M. Erlanger, who was the banker of the Confederacy throughout the rebellion, will prejudice the undertaking in the United States.—*Times*.

## Correspondence.

### The Other Side of the Story.

WYOMING TERRITORY, Sept. 9th, 1868.

To the Editor of the Journal of the Telegraph:

Permit me to address a few lines through your valuable columns to the telegraphers in the East. A good many know very little about this vast American desert, through which the Union Pacific passes, and which, at a not very remote date, will connect by the closest ties the commercial interests of the Eastern States with those of the Pacific. Operators coming out and engaging in the service of the Union Pacific have but a very faint idea of the duties that are to be imposed upon them, much less the salary they are

to receive. Only those who have been through the "mill" can give any idea of what is undergone by telegraphers, who are the poorest paid and have the most arduous duties of any class of men on the road. Please follow me, and I will try and give you as near as possible my experience. Arriving at Omaha, after a very fatiguing journey, I reported to Mr. H. H. Cook, superintendent of telegraphy. He offered a position as night operator, salary \$65 per month, on his division, which extends to Cheyenne, 500 miles west of Omaha, but gave me to understand that by going west to the end of the track, 800 miles, I would receive \$100 or \$125 per month. I could not account for this, but supposed it was on account of the Indian troubles, and having a strong desire to see and perhaps have a brush with the "reds," I concluded to go as far west as possible. Accordingly got orders to report to J. K. Painter, at Laramie, 600 miles west of Omaha. He also gave me a very flattering account of what the country was 700 miles west, and again I was sent forward (not that I desired to do so, but could not help myself), and reported to Mr. J. N. Orrell, chief operator of the most western division, whom I found to be a very gentlemanly person, and willing to do all in his power for the operators in his employ. I now started to take charge of my new office, near the end of the track, which I found to consist

of a small tent set on the sand, a soap box for an operating table, a small barrel for a chair, one rifle and forty rounds of cartridges, and two common goat blankets. Had promissory visions of a good mattress, cook stove and cooking utensils. I found the nights very cold—ice will form on a pail of water almost any night in the year in this climate. Having no night operator, I had to commence work at four or five in the morning and work till nine P. M., and sometimes till midnight. Then I was at liberty to "turn in." Turn into what? Why, roll up in my blankets, with my boots for a pillow, and lay down in the sand and alkali dust, which latter so irritated the nostrils as to cause

the nose to bleed almost constantly. There is at every station a water tank, (which, in many places, has to be supplied by a regular water train, there not being water in many places), one or two section houses or tents and telegraph office. The only board I can get is at one of these section houses with the track laborers. Friends, have you ever taken a meal in an Irish shanty? You all must have seen some along any of the Eastern railways. If you have, you know the quality of board we get out here. The first day I eat nothing; the second I made a meal of sour bread and strong butter. Perhaps you knew the effects of such diet. Suffering from the cold for over three weeks, my stove and mattress at length arrived. The former consisted of sheet iron, made in the form of a cone, two feet high and eighteen inches broad at the base, a small door on the side and no bottom, with about six inches of pipe attached. After some study I found I would have to build a mound of earth or stone, and elevate my stove so that the pipe would reach through the canvas of the tent. The mattress was about thirty inches wide by six feet long, and could be bought in the States for \$1. What water there is is so impregnated with alkali, iron, salt, sulphur, &c., as to be almost impossible to wash in, and as a beverage is only equaled by a good dose of salts. Graybacks of enormous size are very plentiful. I have not yet seen any person who could not find some on their persons. The only redeeming quality is the grandeur of the scenery. You see rocks piled up in all fantastic shapes thousands of feet high. The peaks of the snowy range of the Rocky mountains, covered with the snow and ice of centuries, tower up 12,000 or 15,000 feet above the sea level. For those romantically inclined this is all very pleasant, but soon becomes tedious. No sweet fields of waving grain, not even a spear of green grass, meets the weary eye. Nothing but level plains of sand, dotted with wild sage and hardy mosses; on the mountain side a few hardy and stunted cedars cling to the rocks. Nought save these and barren rocks are to be seen for hundreds of miles. As yet I have not seen ANY redeeming qualities in the railroad. You are sent here; if you do not like it, why, go HOME, but you get no passes; 800 miles or more from civilization, and railroad fares about eight cents per mile. Some of the boys have had the mountain fever, brought on by overwork and exposure, and were sent to the hospital, where they had poor attention, in fact none save what they received from brother operators, and I believe had the privilege of paying the doctor a fee of \$5 per visit. Everything is lively now, and will be so while the road is in process of building, but so soon as finished, and nothing but the regular routine of duty, no company save the section men within ten or fifteen miles on either side of you. Pleasant reflections for the operator who has to winter in these mountains, where it is likely to snow up so that trains will be blocked up a month or more at a time. Now we will see how profitable it is to work for this company. They only pay \$75 per month; board at from seven to ten dollars per week, and is such as none would have at any price in the East; washing from twenty-five to fifty cents per article. Alkali dust settles in your clothes and boots, and when once wet eats them up in a short time. Every thing is four or five times the price that they are in the East. I have given a correct account, and if any of you have the Western fever come out and try it. Am sure you will soon find a cure, if you do not get the mountain fever, after a month's "residence" here.

I am yours,

A TOTAL WRECK.

THE line from New York to Havana, although from Punta Rassa to Havana there is not a foot of wire above ground, is capable of being worked as rapidly as any land air line, and is operated with much care and correctness.

#### Telegraph Instrument.

Robert K. Boyle, New York city. This invention relates to a new telegraphic printing apparatus, which is so arranged that it will adapt itself to every variation of the weather, and that it will utilize the whole power of the current. The invention consists, first, in a new arrangement of connecting the magnet with the electro magnets. In this apparatus four electro magnets are employed, a pair being arranged on each side of the horseshoe magnet. The two electro magnets on each side are arranged one above the other. Two horseshoe magnets are firmly secured to an oscillating horizontal bar, in such a manner that each end of each horseshoe is between the two opposite face plates of two opposite electro magnets. By means of this arrangement the through current, which is generally obtained, is avoided, and the horseshoe magnet will more easily change its position when the polarity of the electro magnets is reversed.

#### Effect of the Galvanic Current upon the Tenacity of Wire.

Mr. James Wylde has made public the results of some experiments which are of great importance to telegraphic science. He says that he found, some years since, that when intense currents were passed through the best copper wire, in only one direction, its tenacity was gradually destroyed, so that it could finally be crushed to pieces by the fingers. This loss of tenacity occurred first and in a greater degree at the negative pole. An examination with a microscope revealed at the broken surface a complete molecular change, a crystalline structure having taken the place of the fibrous. He states that, having entered upon some extended experiments in connection with submarine explosions by means of the voltaic current, he was frequently annoyed by the breaking of one of the wires, and in all cases found the structure at the broken part crystalline. From these facts he infers that intense currents passed through submarine cables must eventually deteriorate them, and counsels their avoidance. The frequent reversal of the current, in regard to direction, lessens or entirely prevents the molecular change in the wire. —*Scientific American*.

#### Death of the German Chemist Schonbein.

The telegraph announces the death of another eminent philosopher, whose labors have conduced greatly to the progress of science during the last half century. Christian Friedrich Schonbein was born in Wurtemberg, Oct. 18, 1799. At the age of twenty-five he was a professor of chemistry at Reihau. After visiting and spending considerable time in France and England, for the purpose of completing his scientific education, he commenced a brilliant career in the university of Basel. His first experiments in this celebrated institution led to important voltaic and electro-chemical investigations, which resulted in the demonstration of important principles. In 1839, his attention was attracted to certain peculiarities in the chemical action of oxygen, and its existence in the allotropic condition to which the name of ozone has been given, was made by him the same year. In 1845 he invented gun-cotton. The later portions of his life have been devoted to experiments with oxygen, and the production of numerous works upon abstruse physical and scientific subjects.

IMPORTANT concessions having been obtained from the French Government, a French company has been organized to lay a cable from Marseilles to Corsica, which will probably be extended to Algiers, and ultimately along the north coast of Africa to Suez. This will place Paris in connection with the great public works there which now approach completion, and which must have so important a bearing on the commerce of India.

#### A Massive Cable.

The new cable recently laid between Lowestoft and Tandvoort (83 miles in length) to replace the one formerly landed farther to the north, on the English coast, is perhaps the heaviest and most carefully constructed ever prepared.

It has four conductors, each of which consists of a strand of seven number 22 wires of the weight of 107 lbs. per knot, with a resistance of not over 12.07 Ohms per knot, and a specific conductivity of 92.34 per cent. of pure copper. The insulator is of three coatings of gutta percha with three alternative coatings of compound, of the weight of 150 lbs per knot. The cable, when delivered, showed the following extraordinary conditions:

Resistance of Insulation, . . .	746 millions per knot.
Conductivity, . . .	96 per cent.
Inductive Capacity per knot, . . .	3784 Farada.

The sheathing in eighteen miles of the main cables consisted of 11 No. 1 best best galvanized soft iron wires; each wire was first passed through a bath of bituminous compound, and then served with two reverse servings of tarred Russian hemp. Weight of main cable, 12 tons per knot.

The shore end cable core after being wormed and served, was first sheathed with fifteen No. 5 best best galvanized iron wire, then covered with tarred jute and again with bituminous compound. The cable was then finally enclosed with an external sheathing of eleven strands, each containing three No. 5 galvanized iron wires, each strand having previously passed through a bath of compound and then covered with two reverse servings of tarred Russian hemp, the whole being covered with bituminous compound. This illustrates the immense care now taken in the manufacture of these world girders, and the perfection to which they have attained.

#### A Good Rule.

CHICAGO, Sept. 14th.

A most beneficial result has been effected in this district by the establishing and enforcing of a rule regarding delayed messages. The rule requires that in every case where a message is on the books over twenty minutes, that a record of the same be made, and sent to the superintendent, with a memorandum showing cause of delay. All cases of this kind are promptly investigated, and any employee at fault is made accountable. The rule has been in force about two weeks, and a marked change is already noticeable.

The Western Union Telegraph Company will put up another wire from Chicago to Omaha this month — 500 miles.

D.

AN envelope with an S and P ingeniously twisted around each other and stamped thereon, is on our desk to-day. On opening it we find the name of Mary J. Prentiss on one card and Mr. and Mrs. S. J. Smith, Jr., at home, on the other. Another pair of doves! How thick they are on these cool fall nights! This is a very proper union. The lady has been a 'Prentice(ss) long enough, and is now taken into partnership. Happy Smiths! we kiss our hand to you.

#### Where is Glip?

Not a little fun was occasioned by the following messages that passed over the wire a few days since.

To —

"Our Glip is lost, what shall we do?"

(Answer.)

To —

"You say you have lost our Glip, Well, my reply is, let her rip. Tell Kennedy, and all his pack, If they find her, not to bring her back. 'Twas ever thus, and thus it am, Pay this despatch, I'm busted

SAM."

42, collect 1.73.

THE Atlantic cable of 1865 has never been interrupted since it was laid down.

**The Speed of the Senses.**

According to the researches of Helmholtz, a distinguished German physiologist, and others, it has been ascertained that the nervous fluid moves at the rate of about ninety-seven and one-tenth feet in a second. Now electricity travels with a speed exceeding 1,200,000 feet in a second, and light over 900,000,000. A shooting star moves with the velocity of 200,000 feet in a second, and the earth in its orbit around the sun 100,000. A cannon ball has a mean velocity of 1,800 feet in a second; an eagle, 180; and a locomotive, 95. The nervous fluid, it will be perceived, has no very remarkable rate of speed. A fact, which among many others it is asserted, serves to indicate its non-identity with electricity. Again, Professor Donders, of Utrecht, Holland, has recently been making some interesting experiments in regard to the rapidity of thought, which are likewise interesting. By means of two instruments, which he calls the noematachograph and the noematachometer, he promises important results in the future. For the present he announces that the brain requires sixty-seven one-thousandths of the second for the elaboration of a simple idea. Further, it is stated that the eye requires seventy-seven one-thousandths of a second to communicate an impression to the brain, and that for the ear to communicate a sound one hundred and forty-nine one-thousandths of a second are necessary. The eye, therefore, acts with nearly twice the rapidity of the ear.

**Persistence.**

In the *Archives du Christianisme* there is a deeply interesting account of a Spaniard who printed the New Testament in a deep cellar. He labored alone with a poor wooden machine and very few types. His work progressed slowly; he could print but a few pages at a time. Being shut out from his glorious Andalusian sun, and exhausted with labor, his health failed, and he raised blood. He was urged to rest for a while, but he refused, declaring that he would not leave the cellar until he could bear from it in his own hand a Spanish New Testament printed in Spain. He kept his word, and Christian friends have seen and handled this New Testament. There is great hope for Spain when such men, worthy contemporaries of Matamoras, rise up from the surrounding darkness, and prove themselves valiant for the truth even unto death.

**Telegraphers'****Mutual Life Insurance Association.**

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

D. R. DOWNER, Secretary.

J. D. REID, Treasurer.

**DIRECTIONS TO APPLICANTS.**

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.
  2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.
  3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.
  4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.
  5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.
- By permission of the Western Union Company, and to avoid risk by mail, remittances may be made by an order signed by a Manager on John Horner, Cashier, New York office. Whenever practicable it is desirable this should be done.

**France.**

PARIS, SEPTEMBER 24.—The *Moniteur* of this city announces officially this morning that the government concession lately granted in favor of MM. Erlanger and Reuter, of the Franco-American Telegraph Company, authorizing them to lay a submarine telegraph cable between France and America under certain reserved conditions, has become definite and complete, capital to the amount of 27,500,000 francs—the main condition—having been subscribed for the undertaking.

The concession for this great work bears date July 6, 1888, and confers the privilege of laying and working submarine telegraphs between France and the United States.

The cable will, as at present proposed, be laid in two sections; the first from Brest to the French island of St. Pierre, off Newfoundland; the second from St. Pierre either to New York direct or to a point between Boston and New York, with a special line to New York.

The length of the cable is as follows: First section, from Brest to St. Pierre, 2,225 miles; second section, from St. Pierre to the United States, about 722 miles. Total, 3,047 miles.

A contract has been entered into with the Telegraph Construction and Maintenance Company to manufacture and lay this cable for the sum of £920,000.

The financial calculations and scientific experiments of the new company set forth the following results: The power of transmission of the cable is estimated at a minimum of twelve words per minute, which, allowing fourteen hours a day for waste time, and only ten hours a day for actual work, and taking three hundred working days in the year, gives, at the rate of £2 per message, an annual income of £432,000. The working expenses of the line are calculated at £30,000 per annum.

In connection with this enterprise it is interesting to state that the French despatch boat *Travailleur*, from Rochefort, has been ordered to the Mediterranean to assist in laying down the submarine cable to connect the telegraphic lines of Algeria with the coasts of France.

**Still Another.**

Parties at Berlin are attempting the organization of another Atlantic cable company to lay a cable connecting with the United States, one of the features of which is to give subscribers credit for their subscriptions on the books of the company and have the amount returned in the sending of dispatches.

**Personal.**

H. McGregor and John L. Janes have been appointed assistant operators at Quincy, Ill.

J. M. Ellison, late manager of Joliet, Ill., who has been on a tour in the far West, will resume the management of that office Sept. 1st.

John Thode has resigned the management of Galena, Ill., office, and Wm. F. Altemeyer, from Chicago office, appointed as his successor.

A. A. Honey, late assistant at Quincy, Ill., has accepted the position vacated by Mr. Altemeyer in Chicago office.

Asa R. Swift has been appointed superintendent of the lines on the Chicago, Rock Island and Pacific railroad. Mr. Geo. W. Graham, late manager of Des Moines, Iowa, office, takes the position of operator in the office of the general superintendent of that road.

Mr. Samuel M. Allen has assumed the management of Jacksonville, Ill., office, vice T. Rice Smith (one of the oldest operators in the West) resigned.

Mr. A. H. Bliss has retired from the service of the Western Union Telegraph Company.

**Among the Wires.**

BY A LADY OPERATOR.

There was no evading the matter. There was the bald fact, and the woman herself staring me in the face. I listened to her story, and, listening, read again and again the message she handed me. It was in my own handwriting. I had but one lucid thought concerning it. It was that three days before I had read that message from the wires, copied it, and had it duly delivered to the woman before me. It was legibly written, alarmingly so:

"Send me one thousand (1000) dollars to-day's express without fail."

"And it was but ten dollars my son telegraphed for!" shrieked the woman. "But ten dollars! I have seen him. I shall get his message and you shall see it. Who is going to pay for this outrageous mistake? Do you think I am going to be dragged about here and there, getting a thousand dollars for my son, going with it myself to him, and after all my trouble and expense, finding him in good health and in no particular misfortune? Not I. Your villainous, detestable, diabolical company must settle for this damage!"

She said more, and, as I re-read the message, there was presently a marvelous blending of her accusations with it, and with the current of my own thought. I could not then have undertaken to defend myself even from the charge of having fabricated the message from date to signature. All the means for redress, inquiry and explanation, which had never hitherto forsaken me, seemed for the time obliterated. The message now no longer read: "Send me one thousand dollars." It was hundreds of thousands! millions! any sum at all!

My agony and remorse were boundless, and, overcome with confusion, I fainted. When I awoke to consciousness I was alone in my office. I heard the wind blowing, and the driving sleet against the window, as I had heard them mingled with the woman's voice, but where was the woman and the message? Ah, yes, I understood it. She had been trying to restore me to consciousness, and failing, had gone for assistance, so that, considering the hour was late, it was evident several moments must elapse before her return. I was not a little piqued at what might be the *denouement* of this mortifying affair. Business had lulled. For a few moments even "No. 4" wire was quiet. Instantly I called the station and asked for a repetition of the fatal message.

"Send me one thousand—"

"O. K.," said I. "The woman says he sent for ten dollars."

"Can't help it; he only wrote the figures, and put the dot in the wrong place. Run off before I had time to—"

"O. K., O. K.," I said, for I did not care to hear more, and, indeed, any vitality on my part was not at all befitting the occasion, considering a delegation from the village, headed by the woman and the doctor, just then came bursting in to restore me to life. And there was a glorious *restoration* presently thereafter.

**Earthquakes and Electricity.**

Mr. Daniel M. Donnelly, a civil engineer of Brooklyn, has for many years made meteorology a study, and has formed opinions respecting the agency of electricity in the production of earthquakes which possess interest in connection with the recent violent convulsions in South America. At our request he has kindly consented to communicate to us a paper on this subject, which we will lay before our readers. The whole subject of meteorology must soon engage more practically the minds of scientific men. There is not in all the world so fine a theatre for its elucidation as in the United States, and nowhere has so little been accomplished.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 8,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, OCTOBER 1, 1868.

### To Correspondents.

Several letters, well and kindly written, but which we are compelled to decline, have reached us during the past week. One is in defence of a Superintendent who does not require it. Another is in defence of ourself, which we accept from its fair writer kindly, but cannot use. We cannot consent to use the JOURNAL for the publication of articles which could only provoke a continuance of the abuse they are designed to expose.

As to any use of our own name, which may grieve our friends, we wish them to know that to us it is a matter of indifference, and, indeed, ought to be regarded as complimentary when any supposed "piety" of ours is made its occasion. There is no higher honor than to be known as a Christian gentleman, and which we would be glad to deserve. As an editor, we must expect to receive the perquisites which its duties generally secure, and occasional abuse is one of its normal endowments.

### Gastronomics and Electricity.

There is much magnetism in a good dinner, especially if the cuisine be under French superintendence. We speak from profound experience, having just passed through the experiment on board of the French steamer *St. Laurent*, under the manipulation of its gallant commander, Captain Bocande. It was a highly successful process throughout, and a very pleasant preparation, bodily and mentally, for the exhibition of the electric light in use on this magnificent vessel which followed.

Coffee and cigars having performed their part in the conclusion of the gastronomic process, a select company of ladies and gentlemen, we being of the number, repaired to the pilot bridge to witness the operation of the electro-magnetic light recently introduced on this steamer. The electricity is generated by a combination of sixty-eight compound magnets in the engine room, kept in rapid revolution around an armature by a small donkey engine, the light being produced between carbon points in the usual way. The light was very powerful and was directed at will to different objects on the land and the water. By a simple switch the light was changed from the pilot bridge to the trucks of the main mast from whence a dazzling stream was thrown far across the river. This light is maintained without expense except for carbon points, and is regarded as a great acquisition to the means of securing safety from collision at sea. In dark nights also it can be so thrown that the dangerous process of reefing can be accomplished as in the light of day. We will refer to this again.

THE Anglo-Mediterranean Telegraph Company are engaged in taking soundings between Malta and Alexandria, a steamer having been despatched by the British Government for that purpose.

## OFFICIAL STATEMENT.

Western Union Telegraph Company.

AUGUST, 1868.

Gross receipts,	- - -	\$602,304 78
Current expenses,	- - -	376,452 03
Net profit,	- - -	\$225,852 70

This exhibit shows an increase of \$31,627.88 over the receipts of August, 1867, while the expenses have only increased \$481.86.

### Six Hours a Day.

We have no desire to advocate prolonged or exhausting labor. Those who remember our management of lines will make no such charge. We put on the same harness as our men, and wore it longer. For nearly a score of years our personal labor was limited only by six hours taken for sleep. But we ever considered the comfort and health of those who served us. Whoever denies this, errs.

Since then we have not changed. We love labor. Congenial toil is the grandest thing under the sun. We like to see a good man at the key making his fingers go as if he loved it. Yet, we know that steady toil is not good. The finest and firmest organization will weary. So toil must have its limits, and rest and recreation and the jolly hours of home love and radiance must have their own.

Recently the remark has been attributed to us that "six hours labor per day is all of which an operator is capable and preserve health." Now, although we used language equivalent to this, the inference is false when made to argue a limitation of six hours per day for telegraph service. We used that expression in resisting the proposal of a Senator in the United States Senate to absorb the private lines of the country, in which he claimed a capacity of service such as we knew could not be sustained unless by a system of relays of men. We say now, and no operator will deny it, that there is no operator's brain strong enough to maintain a service of over six hours per day and transmit messages at the rate of 2,000 words per hour. The following are extracts from the paper referred to:

"A communication by telegraph has this marked peculiarity; it demands a calm, unoccupied brain, and a steady hand to manipulate its contents letter by letter, in a language of monotonies. A slip of the finger from the manipulating key changes its meaning; a truant thought alters the manuscript: a shadow of forgetfulness mars its whole design."

"One of the most effective means to secure freedom from error is the retention of qualified operators who become so accustomed to the address of parties, and acquire such an indescribable aptitude for the special service of the wire on which they are employed, as to enable them to transact their duties from month to month without error."

A Senator having given the capacity of six wires working twelve hours per day as  $6 + 12 + 2000 + 365 = 52,560,000$  words per annum, we claimed that to do such labor would require relays of men and said:

"Now the truth of all this is, that although it is possible under favorable circumstances to send 2,000 words per hour, yet it is utterly impossible to send messages requiring care at anything like such an average rate by the present process. There is in the tension of the brain of an operator a limit to all such use of the wires when crowded to their capacity. The necessary absorption of the mind is exhausting. To crowd the work beyond a certain rate would require relays of men to relieve each other. Six hours continuous service of this character is all that a young person is capable of performing and maintain health."

Now, then, we are understood. We repeat, with all the emphasis we then felt, these statements. We oppose every overtasking of the brain, except our own, as foolish, unremunerative and wrong. No company is justified in doing it. We do not believe that, as a rule, it is done. In the most constantly operated wires, there are either such natural lapses of occupation as to give rest and recuperation, or relief is provided by change of force. Emergencies indeed occur, where all must submit to an unusual crowding. These, however, are very rare, and should

be met cheerfully and treated fairly. We like to see a Superintendent at such times sending for wholesome refreshments, and with his sleeves rolled up, cheering his men by his presence and personal interest. That is the plan we used to pursue and it is not abandoned yet. Prolonged extra service deserves remuneration, and always has it where managers are true to the interests of the company; but men who growl at an occasional extra pull to clear the wires should be sent to sea. We don't like them. They never have a cheerful face or a clean shirt.

The record of the New York office of the Western Union Telegraph Company shows that only three wires transmit over 300 messages per day and night, and there are seven which average 225 per day, sixteen which average 150, and twenty-five which average 100. These figures do not argue hard service, but indicate an extent of occupation consistent with cheerfulness and good health.

Managers of Offices are particularly directed to the Tariff Circular on the sixth and seventh pages.

### Quick Work.

A gentleman came in to one of our Western cities one day last week and left a message for his friend in New York, enquiring the value of a certain stock. It was sent to the office at the room of the Gold Board. The person addressed happened to be present, and Manager Schram, whose eyes are always open, called him. The answer was written while the message was being received, and sent at once. An order to purchase was at once given, the first sender not having left the office. The whole business, the enquiry, the response, the order, occupied a minute and a half! Manager Schram thinks that good time. So do we.

### Use a Lemon or Two.

One of those odd mistakes, which occur now and again in the best of families, was made at one of the small telegraph stations of the Western Union Telegraph Company in New Jersey, where little business is done, and where the old registering apparatus is in use. Having telegraphed to the family physician in New York, respecting some symptoms which needed attention. The doctor telegraphed as follows:

New York, August 25, 1868.

TO JOHN ADAMS—

B—, New Jersey.

Use flannel stockings and dress bowels in flannel if milk don't curdle. See letters of two dates. B. B.

The message was delivered as follows:

"Use flannel stockings and dress bowels in flannel. If milk don't curdle, use a lemon or two!"

The mistake was discovered from the fortunate fact that there were no lemons in the market, and the anxious parties telegraphed to know if the extract of lemon would do as well!

Has any one seen Superintendent J. C. Hinchman lately? He wears a new face, a softer eye, and has a touch of gentleness in the voice that indicate us that something has happened. His boots, also, have a brighter lustre, and his linen somehow lays about him neatly and gently. Ah! here comes the Boston Post and the revelation. He has been to Vermont, and in passing through Boston was made prisoner to a fair lady by an Episcopalian Bishop, who fastened the chains. J. C., we congratulate you. Live long and be happy. Accept our benediction.

SUPERINTENDENT BEDLOW is busy. He has just finished the reconstruction of the lines between Brunswick and Bangor. He says they work byootiful. He has also built fourteen miles of new line from Beverly to Gloucester, and reinsulated and soldered the wires from Gloucester to Boston. A large amount of work remains to be done before snow falls, but these Maine men know to push things.

**Governor Bullock.**

The likeness on our first page is that of Governor Bullock, of Georgia, for a long time identified with the Printing Telegraph system in this and other States, both as operator and manager, and whom we still keep on record as "one of the boys." He entered the express business some years ago under Gen. Sanford, and soon after became President of one or more express companies in the South. We are glad to see our associates rising to posts of trust and honor, and hope Governor Bullock will be able to use his high trust for the good of the whole people of the great State over the fortunes of which he presides.

**An Important Book.**

Milton P. Jarnagin, Esq., of the law firm of Scott & Jarnagin, Memphis, Tenn., has left with us a synopsis of a book, of which the following is the title:

"A Treatise upon the Law of Telegraphs; with an Appendix, containing the general statutory provisions of England, Canada, the United States, and the States of the Union, upon the subject of Telegraphs. By William L. Scott, and Milton P. Jarnagin, Memphis, Tenn. Boston: Little, Brown & Co., 1888."

Reference is made to all the reported telegraph cases, and liberal extracts made, so as to give the reader a fair chance to know the course of reasoning, as well as the weight of authority upon the various controverted questions. The authors intend thus to make the book useful, aside from their own observations—so that if their deductions should be unsatisfactory, the materials are furnished in such abundance in the notes, that every one may judge for himself.

The English statute is given literally, as a model of careful and practical legislation. The volume is a royal octavo, printed at Cambridge, and of superior typography. Price six dollars. It is favorably noticed in the Law Review for October, and as a compilation of the history of telegraph legislation and jurisprudence must be valuable. We shall refer to it again.

**Removed.**

Chester, Partrick & Co., Telegraph and Electrical Engineers, Philadelphia, well known for the superior quality of their manufactures, have removed to more capacious premises at 38 South Fourth street, where they can carry on their enlarging business to more advantage. We have only time to say—"Success to you." See their advertisement.

**Telegraphers' Mutual Life Insurance.****ASSESSMENTS RECEIVED.**

F. H. Selbert, Alfred H. Seymour,  
Hattie C. Reade, Samuel C. Taylor,  
W. H. Stanton.

ONE of the new structures erecting this season by the Western Union Telegraph Company is a line from Columbus, Texas, to Indianola, on the Gulf of Mexico, about one hundred miles in length. From Indianola it proceeds along the Lavaca bay to Lavaca, and thence twenty-five miles by railroad to Victoria, and thence to Columbus, connecting with the existing lines to San Antonio and New Orleans.

**MARRIED.**

In Manchester, Vermont, on Tuesday, September 15, 1888, at the Equinox House, by the Rt. Rev. W. H. A. Bissell, Bishop of Vermont, J. C. Hinchman, of New York, to Miss Caroline M. Orvis, of the former place.

On Tuesday, September 8, at the residence of the brides mother, Troy, Pa., by the Rev. Mr. Fine, Mr. F. W. Garnsey of the Western Union Telegraph office, Elmira, N. Y., to Miss E. Estelle Furman.

On Tuesday, September 8, by the Rev. J. K. Beecher, Mr. W. N. Eastabrook, operator, Western Union Telegraph Co.'s office, Elmira, to Miss Viola Murdoch, all of Elmira, N. Y.

**OLD WIRE! OLD WIRE!**

Parties having old Telegraph Wire on hand can dispose of the same at a fair price to

L. G. TILLOTSON & CO.,

11 Dey Street,  
New York.

Box 1714.

OFFICE OF WORL & CO.,  
TELEGRAPHIC ENGINEERS AND CONTRACTORS,  
No 501 Chestnut St., Rooms Nos. 3, 4, 5 and 7.  
PHILADELPHIA, September 22, 1888.

**DAVID BROOKS, Esq.:**

DEAR SIR—We have used your Insulators on many of the Telegraph lines constructed by us, and have no hesitation in saying that its success, as a perfect insulation, is beyond a doubt or question, while everything else that we have seen during an experience of twenty years, makes a very imperfect and unreliable telegraph line in rainy weather.

In conclusion, we cheerfully recommend them to all who wish good working lines.

Yours, with high regard, &c.,

WORL & CO.

**FREY'S SELF-CLOSING TELEGRAPH KEY.**

"A perfect, simple, homogeneous trunnionless self-closing key."  
—*Journal of the Telegraph.*

The Right of Manufacture in Foreign Countries for sale.

Address—

JOS. J. B. FREY, INVENTOR,  
New York City.

**WANTED—A SITUATION BY A PAPER OPERATOR, WHO also understands Post-office business.**

Address—

MISS C. A. AREY,  
Newton, Mass.

WM. KIDD,  
A. BOODY.

O. H. PEIRCE,  
C. S. OTIS.

KIDD, PEIRCE & Co.,

BANKERS,

19 BROAD STREET AND 57 EXCHANGE PLACE,  
NEW YORK.

Stocks, Bonds, Gold and Government Securities bought and sold on Commission.

**S. S. STAFFORD'S COMBINED WRITING AND COPYING FLUID.**

Labelled by me, for the last ten (10) years, *ARNOLD'S FLUID*

Superior to any Fluid used. It is Greenish Blue in color, turning Jet Black, flows freely, dries rapidly, does not set-off in books, gives one or more excellent copies. Has no sediment, can be used to the last drop. It is 33% per cent. cheaper than any other (so called) combined ink. Used exclusively by the Western Union Telegraph Company.

For sale by all Stationers and Druggists, and at No. 11 Cedar street, New York.

S. S. STAFFORD,  
Chemist, N. Y.

**A. S. OHUBBUCK.**

HOTEL STREET,

(Adjoining the Post Office.)

UTICA, N. Y.

Manufacturer of

Telegraph Instruments, Batteries,

and every description of

TELEGRAPH SUPPLIES.

INVENTOR OF THE

"PONY SOUNDER," REGISTER AND KEY.

Every Article Warranted of the

BEST MATERIAL AND WORKMANSHIP.

The Oldest Establishment in the United States.

**AMERICAN COMPOUND TELEGRAPH WIRE.**

SUPERIOR CONDUCTIVITY,  
LIGHTNESS AND DURABILITY.

A MOST IMPORTANT INVENTION.

We would call the attention of Officers of Telegraph Companies, Telegraph Builders and Contractors, and the Public, to the new

PATENT COMPOUND TELEGRAPH LINE WIRE.

Manufactured by the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY,  
OF NEW YORK.

This Wire has already been put up on sections of several Telegraph Lines, and its merits fully tested, and the results show that it combines all the good qualities which are claimed for it, viz., *Economy, Superior Conductivity, and Increased Strength, with Decreased Weight of Metal.*

In its composition are used three metals, either of which is a good conductor, Steel, Copper and Tin; and the superiority of Copper as a conductor over other metals is well known, and but for its ductility rendering its permanent suspension in a pure state intact impracticable, it would have always been used exclusively as a Conductor on Telegraph Lines. By combining it with Steel the desired strength and permanence is attained, and the necessary weight of the line wires reduced two-thirds, thus obviating the necessity for using a large number of poles to the mile, and by reducing the points of contact, lessening the chances for trouble and escape of the electric fluid.

All other Line Wires must inevitably be superseded by this, and such Telegraph Companies as now adopt it will the sooner realize the advantages to be derived from its use over those whose lines are of the old rotten and rusty iron wire pattern.

For further information, call on or address

SAMUEL C. BISHOP, General Agent.

INSULATED POLE LINE CORDAGE

AND

OUTSIDE-OFFICE CONNECTING WIRES.

We have completed some valuable Experiments, and have now the pleasure to offer to Telegraph Companies, and others interested,

THE BEST

AIR LINE

AND

OUTSIDE OFFICE INSULATED WIRES

that can be had

Parties using are invited to examine them at our Office.

SAMUEL C. BISHOP,

May 30, 1888.

General Agent.

**STICKWELL & CO'S EXTRA MUCILAGE**

THICK, CLEAR AND ADHESIVE

Who has not used

STICKWELL'S MUCILAGE?

That man must be an old POGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the Parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding "or any other man." It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOURS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, 80Z. CONE, 80Z. FLAT, 80Z. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES

S. S. STAFF RD,  
Sole Proprietor, N. Y.

# TARIFF BUREAU.

## Semi-Monthly Circular.

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
October 1, 1893.

### To all Offices on W. U. Lines—

The following changes have occurred since Sept. 15, the date of the last Tariff Order. Please note them in your Tariff Book:

#### NEW OFFICES.

Hollis, Ill., tariff same as Peoria, Ill.  
La Plate, Mo., tariff 10 more than Macon, Mo.  
Milan, Tenn., tariff 125 from Louisville, and 275 from Washington.  
Montizuma, Ga., tariff same as Oglethorpe, Ga.  
Neshanic, N. J., tariff same as Flemington, N. J.  
Troy, Tenn., tariff same as Trenton, Tenn.  
Xenia, Ind., tariff same as Kokomo, Ind.  
York, Ala., tariff same as Bennet's Station, Ala.

#### OFFICES OPENED ON OTHER LINES.

Bar Mills, Me. Tariff 25 and 2 from Portland, Me. Check Portland.

#### OFFICES CLOSED.

Chapel Hill, Tex., Oakland, Md., and St. Charles, Mich.  
Business for Oakland will be mailed at Cranberry Summit, W. Va.  
Chaumont, N. Y., Cozens' Hotel, West Point, N. Y., Catskill Mountain House, N. Y., Cornwall Landing, N. Y., Lake Mahopac, N. Y., Trenton Falls, N. Y., and Athens, N. Y., closed for the season.

#### GENERAL INFORMATION.

The tariff to Clymer, Mayville, Sherman, and West Panama, N. Y., should be same as Dunkirk, N. Y., from all offices, except those on Erie Railway and branches.

#### TARIFF TO POINTS ON ERIE RAILWAY AND BRANCHES.

The following is a list of offices on the Erie Railway, and connecting lines, with through tariff from W. U. connecting points.

Business for these offices will be sent by the cheapest route and checked accordingly.

Offices that check direct with any that are named in the list, will continue to do so, using the present rate.

WILLIAM ORTON,  
President.

D. BROOKS, DEAR SIR:

We have used your patent Paraffine Insulator upon our lines in this city with the most satisfactory results. The nature of our system and the character of the business transacted by us, are such as to render the absolute insulation of the wires a matter of the utmost importance, and the perfection of the Insulator in this respect leaves nothing to be desired. Our largest circuit of about a mile and a half when tested in a heavy rain storm, with 25 cups of carbon battery, gave no perceptible leakage upon the galvanometer.

Yours truly,

FRANK L. POPE, Supt.

**L. G. TILLOTSON & Co.,**  
11 DEY STREET, NEW YORK,  
MANUFACTURERS OF  
TELEGRAPH INSTRUMENTS  
AND  
MATERIALS OF EVERY DESCRIPTION.

We invite all Telegraphers to a close inspection of our Work.

**WE ARE PREPARED TO CONTRACT FOR THE ENTIRE CONSTRUCTION OF EQUIPMENT OF TELEGRAPH LINES OF ANY EXTENT DESIRED.**

**OUR WORK WILL BE DONE PROMPTLY.**

And it is particularly requested that any goods sold and recommended by us, not proving satisfactory, **SHALL BE RETURNED.**

We have on hand an assortment of other makers' Instruments besides our own, and are prepared to supply them at their own prices—

**BRADLEY'S, CLARK'S, HALL'S, WILLIAMS'**

Or any other, excepting such as we know to be of inferior quality.

**OGDEN'S IMPROVED CARBONS**  
WITH THE  
**IMMERSED PLATINUM CONNECTION.**

Make, beyond question, the most perfect Battery yet produced. We have abundant testimony of their **GREAT SUPERIORITY OVER ANY OTHER.**

We particularly invite attention to our whole arrangement of the

**CARBON BATTERY.**

Proving, as it does, that as much strength may be obtained from this Battery as the Grove, with far less expense.

### DR. L. BRADLEY,

No. 7 EXCHANGE PLACE, JERSEY CITY, N. J.,

Keeps constantly on hand and for sale his

**IMPROVED TELEGRAPH INSTRUMENTS,**

Having adopted the use of

**OREIDE METAL,**

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed.

His Relays were awarded

**THE FIRST PREMIUM**

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them. Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-300th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

#### PRICES.

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	18 00
Main Sounders—same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Register.....	40 00
Pony Sounders.....	6 75
Keys.....	6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package.

He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers prices.

### THE BROOKS'

**PATENT PARAFFINE INSULATOR WORKS,**

No. 22 SOUTH TWENTY-FIRST STREET,

**PHILADELPHIA.**

All varieties of INSULATORS manufactured at these Works are warranted to excel the usual style of Glass and Rubber more than one hundred fold. In view of the error and delay in transmission, waste and consumption of battery material, the results of defective insulation, its fragile nature and expense of renewal, nothing is more manifest than its economy.

To RAILROAD COMPANIES relying upon the efficiency of their telegraph departments it is of great value.

**JOHN POLHEMUS, Printer and Stationer, 102 Nassau St., N. Y.**

VOL. I.

## MEMORIES OF OTHER DAYS.

### A Narrow Escape.

BY THE EDITOR.

The circular of Parker Spring & Co., of which notice is made elsewhere, recalls to mind an incident in which we think Park, as we used to call him then, was a party. It was in the summer of 1847 when a new line was being built under our superintendence along the railroad between Philadelphia and Lancaster, Pa. We were at this time at work near Paoli, about twenty miles from Philadelphia, and at supper time had all congregated at that station. We had done a good day's work and were pretty wearied, but it was necessary on account of the number of trains passing over that busy thoroughfare to wait until all had passed before distributing the material to be used by the workmen on the following day. The last of these was the night express from Philadelphia, leaving thence at 12 P.M., and for that we waited patiently, beguiling the time between books and papers, chequers and story-telling as the humor led.

It was therefore long past midnight when the distributing party sallied out with their well laden hand-car. Park Spring, John Reed, Jake Campbell, and we think David Brooks (Dave as we then called him), who had come up to have a hand in the work, were among the party.

The night was very quiet and dark, and as they started with their lanterns on their midnight work, with a kind of joy such as we all used to feel in those good old fraternal days, we stood long after the car was out of sight enjoying a pleasant thought of the delight of cheerful labor, which could thus steal from sleep her needed rest in order to perform a necessary service. The track of the railroad was a double one, and the men had started on the north side so as to be nearer the holes at the side of which the arms were to be thrown. Off they went full of glee, and I waited till long after their voices were lost in the distance and all was still.

While thus standing and just about to return to the hotel, the noise of a train coming from the South became perceptible, and putting my ear to the track I could distinctly hear its low thundering growl every moment growing louder. I was struck with horror. The hand-car had taken the northern track. That was the road of the up trains. Not expecting any, and prevented from hearing the sound of this unexpected one by the noise of their own car, I imagined the whole party destroyed, and my brain became hot as I pictured to myself the figures of these good men in mangled fragments on the track. Just then a large class new locomotive on its way to Altoona shot past me like a flash and was out of sight in an instant. As its bright rods and shining cylinder glared for an instant upon me in the light of my lantern, the gleam seemed fiendish as it were the glint of an assassin's dagger as he hurried from his bloody work.

Under the excitement which thus overwhelmed me, I hurried down the road, anxious to hear the sound of living men, and was soon cheered by the rumble of the returning hand car and the well-known

ring of Jake Campbell's voice, as he called out to the distributors to heave an arm, as the car came to the appropriate place. When they stopped, I found that after proceeding along the road for some distance, John Reed, without any reason which he could assign, and with no knowledge of danger, suggested to the party to put the car on the other track. To this, notwithstanding it was a work of some labor, all the rest had assented without question. The car had just been removed, and the party entering it to commence their journey east, when the locomotive referred to shot past them at the rate of forty miles an hour. It was a marvellous escape, and made these strong men silent and weak. The memory of it haunts us to the present hour, and as we occasionally stand at night by a railroad track waiting for a coming train, there will still, in imagination, flash through the darkness a spectral locomotive with its glittering steel, and with it a sense of horror, such as broke upon us in that dark summer night at the Paoli station.

### Vandalism.

One of the peculiar faculties of the late Prof. Faraday consisted in his great mechanical ingenuity and constructiveness, as evidenced in the apparatus for conducting the original and elaborate experiments by which he arrived at such great results. Their main character was simplicity, which is indeed the perfection of ingenuity, and the distinguishing feature of the work of genius. As has lately been remarked by a good judge, "the practical powers were never perhaps more strikingly displayed by man than in the various contrivances he adopted while conducting his researches—some of them being almost equivalent in ingenuity to the compilation of a steam engine." We regret to have to record the fate of these contrivances. Shortly after Mr. Faraday's death they were given by his wife to the porter of the Royal Institution, who, we need not say, could scarcely appreciate them. He accordingly sold them piece-meal, and even parts of the same apparatus to different buyers, thus breaking up combinations that probably were understood by few except their gifted inventor. Thus it is probable that all this splendid collection is destined to be scattered and distributed among those to whom their only value will be as souvenirs of departed greatness.—*Scientific American*.

Is THERE any limit to electrical wonders? The American *Artisan* describes a book containing 24,993 ems of solid matter which was both set and distributed by an electrical type-setting machine in six hours thirty-nine minutes. One of these machines, it is said, may be placed in a newspaper office in Boston or New York, and be operated on by a reporter in any other place connected with the machine by telegraph. That is, the reporter may take his notes to the telegraph and set them up in type at the distant office. Truly this is the age of inventions!

CON.—Why is Vice President Wade ahead of Congress?

Because he brought "nigger heads" to the "poles" years ago.

## METEOROLOGY.

### The Agency of Electricity in Storms.

BY DANIEL M. DONNELLY, CIVIL ENGINEER.

The physical convulsions, which have been in operation during the last year, force on the attention of science phenomena which unmistakably connect all terrestrial changes with a common principle.

It is a well attested fact that the earthquake and volcano have a common origin, and it is equally well ascertained that the various atmospheric commotions—typhoons, hurricanes, etc.—are governed by a common law. It has been proven that all precipitations from the atmosphere, as rain, snow, etc., originate in a common cause. But now it begins to be apparent there is a unity of origin common to all meteors in the three great divisions of the earth—land, water and atmosphere. A careful comparison of the phenomena that attends the meteoric display in each division presents a similarity of operation to that of the other two, and this similarity of operation unmistakably points to a common agent as the disturbing cause in them all.

Earthquakes divide themselves into two very distinct classes, the Undulatory and the Rotatory.

In the undulatory earthquake the earth has an undulatory or rolling motion over an extent of surface with an irregular outline, much longer than it is broad. The noise produced in every respect resembles thunder, and is heard at the same moment of time along the whole major axis, so that a person situated at any particular point hears a rumbling noise, as the sound of successive detonations arrive from successive distances, and the tone of the sound is modulated accordingly. The undulating motion of the earth's surface rolls back the sea, which, returning, carries itself up a distance on the shore in proportion to the momentum it has acquired, and it rolls hither and thither as it receives an impulse or encounters an obstacle. But this motion of the water is not to be confounded with the storm wave, which will be explained further on. The earthquake of Lisbon in 1795, during which sixty thousand persons lost their lives, was a perfect type of this class.

The earthquake of Calabria, Italy, in 1783, during which one hundred thousand persons were destroyed, and two hundred towns and villages were demolished, was a type of the Rotatory class. The town of Opido formed the centre of the convulsion, round which, within a circle described by a radius of twenty-two miles, not a structure was left standing, and the whole face of the country was so altered that it was found impossible to locate property, as the landmarks of one title would be found on the claim by the survey of another. In this class of earthquake the motions are round a core or centre, the greatest violence being at the centre, and decreasing towards the circumference. The detonations are quick, sharp and loud. Where it operates on water, it causes a storm wave which is simply a rotatory motion of the waters round a center and lifting the whole mass to a prodigious height.

Physicists have enumerated two other classes of earthquakes, which they designate Vertical, as that of Piobamba Vinja, at the foot of Chimborazo, in 1797, where the bodies of many of the inhabitants were thrown up a hill several hundred feet high; and the Tremboles, which frequently occur along the Andes mountains; but these are only modifications of the Undulatory form, and should not ever have been set down as separate classes.

In water—the body next in density to the land—we have two classes of meteor, corresponding in their general features to Rotatory and Undulatory Earthquakes, modified, of course, by the yielding nature of the material on which they operate. The first corresponding to the Rotatory are the warm veins of water which are found to exist far below the surface, but further than that they do exist we possess no other data, the super strata always yielding, and transmitting no commotion to the surface. The tide rip which frequently appears at the surface belongs to this class, and its operation bears a strict resemblance to that of the Tremboles Earthquake of the Andes. The water-spout corresponds to the second class, or Rotatory. This meteor originates under the water, which gives the first indications by a rotatory motion on the surface, then the water raises in the atmosphere, still continuing its gyrations. This operation gives motion to the air, and creates the whirlwind, which has been mistaken for the original cause, when it is only the effect of the water-spout. It is true that spouts are frequently formed high in the air, and over both land and water, but it is seen that they are formed in one case without the agency of the air. It follows that whatever agency operated in that one case operates also in the other, and in the latter, as in the former, the whirling motion of the air is the effect and not the cause. The sand-spout—if I may be allowed to coin an expression for the sake of consistency—is a meteor of the deserts of Africa and Asia, which corresponds in every particular with the water-spout. During their progress they present all the features of a whirlwind, but they commence by a rotatory motion in the sand, which is raised into innumerable little cones, then assumes the shape of a column, and is raised high into the atmosphere, and from this spout falls the only rain that ever waters the desert, and which is precipitated in very large drops.

In the atmosphere, the third physical division of the earth, we have also two classes of meteors which correspond to the classes of the other two divisions, and correspond also to their general features, modified, of course, by the elastic nature of the substance on which the disturbing agent has to operate. The lineal storm of wind or rain, or both, including snow and hail, form the first class. They are always attended by two or more strata of clouds and wind, moving in different directions, and so soon as either stratum is exhausted, the storm is at an end.

The second class comprehends rotatory storms, as typhoons, hurricanes, pamperos, etc., which move in horizontal circular gyrations, and seem to precipitate their water from the contact of vertical strata. This water they retain in the vortex of the spout until broken, when it descends in a deluge.

Thus the case is stated so far as ascertained, and now the question presents itself: "What is the disturbing element, the first cause, the prime mover in all those meteoric operations which evidently bear so striking a resemblance to each other." There is an element which is present in them all; this element is evidently their life and being. Let it be examined apart, and its ability to produce such results investigated.

Electricity is an imponderable body whose effects introduces us to an acquaintance with its existence. When excited or created—it is of no consequence which, in observing its practical operations—it separates into two distinct bodies or states, called negative and positive electricity. During their separation

they have a powerful affinity for each other, and the attraction between their bodies is very strong. Now, all nature is divided into two classes, conductors and non-conductors, and if a non-conductor is interposed between the separate bodies of electricity, they cannot unite, but remain attached close on either side of it, the attraction of the body operates through the non-conductor, although the fluid is unable to pass through. Now, let a conducting substance be brought into contact with both of them, and let this conducting substance have a continuous connection with itself, no matter how great the distance, no matter how complicated the contortions, the negative and positive electricity will instantly unite with a shock greater or less in proportion to the amount, and in proportion to the volume and conducting power of the medium of reunion. No electricity can be produced without the presence of water in some of its states, and water is always present at the reunion. Water is a conductor of electricity, except in a state below 13°, when it becomes an electric. Air is not a conductor at any temperature, but becomes a good conductor in proportion as it becomes saturated with watery vapor. Air is said to be saturated when it holds about two per cent., and it cannot contain any more, nor will it accept any more by evaporation no matter what heat may be applied. The lower stratum of atmosphere is always the driest, and it increases in humidity as we ascend. A vapor cloud that will remain suspended in the atmosphere cannot be formed by artificial means. These few axioms will aid the judgment materially in forming a conclusion.

Now, every evolution of the earth gives existence to enormous quantities of electric fluid, one kind always seeking the earth, and the other the upper air, the lower strata of the air holding very little aqueous vapor, forming an insulating medium between them, so that the earth and atmosphere combined form an immense electric battery, and certain portions of the matter of the earth form immense jars, where electricity is retained until connection is made with some conductor which forms a union and restores equilibrium.

Here then will be found the key to the secret cabinet of Meteorology. There are certain physical features on the globe which become as it were the circuit wires of this tremendous battery, and certain physical states of the atmosphere which form a connection, or insulate as the case may be. But some features, as mountains, are nearly always in connection, and their conductors go on accumulating heat from year to year until the last particle fires the train. Fusion commences, with fusion motion, when, instantly, the whole latent power of heat is called into activity and fuses every substance that comes within its reach. The body meanwhile expanding, the crust above it must shake and quake until it accommodates itself to the enlarged volume below. Sometimes it bursts through the crust and forms a volcano which lessens in a small degree the violence of the shock.

The principle must here be borne in mind, "that a solid body in a quiescent condition, (and a liquid in this sense is a solid) confined within a sufficiently strong envelope, will hold enough heat to dissipate it into gas without changing state."

It becomes necessary here to give a passing notice to a theory that has taken a firm grip of the scientific imagination, viz: That the earth was originally a molten mass and is gradually cooling down; that the crust now is say ten miles thick, and that once in a while, by some means not even conjectured, this crust gets broken and spews out its interior mass of molten matter. This stupid theory carries its own refutation. The earth being always subjected to the same condition of velocity, and the same balanced condition of weight, will somebody explain how it is that this crust gets broken? Or being broken—the earth under this condition being an enormous centrifugal machine—by what power is the outflow of

matter stopped? But Dana, than whom I know no higher authority, sets the matter at rest by actual demonstration. I quote from memory: "The mountain cones are invariably rocks of the azoic age, being the lowest stratum of the earth's crust with which we are acquainted, but all volcanoes have their beds higher up and generally in the rocks of the carboniferous age." The subsequent discovery "that all crystalline rocks are not of the primitive age, piles proof on the shoulders of demonstration." Now the rocks of the carboniferous age occupies a position about midway up the crust, say five miles above the lowest or azoic stratum. Will any advocate of this theory tell us why if it be the interior molten mass of the earth that feeds the volcano, the lowest stratum of rocks never come to the surface? Why is it that a particle of these rocks never make their appearance? The only recommendation that I can see for this absurd theory is one that is certainly not valid with the mass of scientific mind, namely: That it warps the whole trend of science, if I may be allowed the expression, into direct antagonism with revelation.

To return to the subject, we find the water-spout, sand-spout and warm vein presenting such phenomena as leave no doubt that the union of two opposite kinds of electricity is the primary cause, and leaving as little doubt that the agent is the same with that producing the phenomena of earthquakes. Then turning to the atmosphere, the lineal storm and the hurricane are found to present the same destructive features, which inevitably leads us to the conclusion that all meteoric convulsions in earth, water and air have a common origin.

Having got an understanding thus far, the two classes of meteors may now be reduced to one, keeping in mind that the conducting mediums are vast plains, and that the electric matter in re-uniting must roll over a core or center which increases as it progresses. If this plain lies horizontal in the earth it will cause an Undulatory; if vertical, a Rotatory Earthquake. If horizontal in the water, a warm stratum; if vertical, a water-spout; in the deserts, a sand-spout. If horizontal in the air, a lineal storm; if vertical, a hurricane. And thus the whole operation of terrestrial change is traced to a single law—the necessity of electric equilibrium.

#### The Chinese Woman's Telegraph.

During the recent visit here of the Chinese Ambassadors, one of them stated in reply to the inquiries of a physician, that it was not customary in China, except among the lower classes of the people, for the doctor to see or touch female patients. In order to ascertain the pulse of the sick woman, a string is tied around her wrist and extended outside the window to the doctor, who holds the string between thumb and finger, and by this sort of telegraph is enabled to count the pulsations. This seems a ludicrous plan, but it is far less mischievous than our custom of admitting men doctors to the private apartments of females. The opportunities for the medical education of women in this country are yearly increasing; and we hope the day is not far distant when the ladies will be able to rout the men from the sick room, and compel them to stand out in the cold, under the window sill. In China only women nurses attend during child-birth.

OFFICIAL information has been received of the completion of another section of twenty miles of the Union Pacific railroad, extending to the eight hundredth mile post west from Omaha, and about 300 miles this side of Great Salt Lake city. The section having been approved by the Government commissioners and the Secretary of the Interior, it is recommended that bonds be issued to the Company.

THERE passes between London and Bombay 30,000 telegraphic messages per annum, at an average cost of \$27 each, or \$810,000 a year.

## Insurance.

To the Editor Journal of the Telegraph:

DEAR SIR—With due admiration for Loganne's "gay and pretty little head," and respect for her feelings, I must say I think her rather severe (not intentionally, of course).

"They are so selfish and indifferent sometimes, etc." We will admit they are—for argument's sake. Is there not a reason for it? I think the error is with the *instrument* of organization itself. Every operator becoming a member would deem himself in honor bound to comply with every assessment made. The salary of the great majority of operators ranges from forty to sixty dollars per month. There is probably not more than one in a hundred of this class of operators who would join an association which would demand of them one dollar per month, and could demand more. I think they are justified in doing so.

There is another objection. The instrument says: "Any person may become a member provided they are or have been employed in the telegraph business." The majority of operators rarely follow it more than from three to five years. If I join this association and pay my assessments for three or five years, and then change my occupation, am I still a member and entitled to its benefits, or am I not? This the *instrument* leaves in doubt.

My plan would be to assess every member one per cent. of his salary per month, and *no more*. With this understanding the membership could be increased to any extent. The enlarged membership would make the liabilities more frequent but the assessments would be so much greater in proportion that it would probably be policy to make the donation a stated amount. By this means the donation could be liberal, and, at the same time, leave funds in the treasury. I would favor reducing initiation fee to one dollar or fifty cents. What is wanted is a start. Better obtain one hundred members at fifty cents each than five or ten at one dollar and a half.

I sincerely believe if changes something like the above were made, and then each superintendent see how many members he can get, that the numbers could be largely increased. Respectfully, &c.,

OHIO.

NOTE. To assess operator's salaries "one per cent. a month" is more than any usual mortality is ever likely to require. Only one death from disease has occurred during the current year. Persons once admitted as members remain so until they withdraw. Withdrawal from business does not require exclusion.

## Check Errors.

For the sake of good feeling between the employees and the Company, we should like to ask: Why is it that in the inevitable monthly receipt of check errors no mention is ever made of the amount which we overcheck ourselves with other offices?

We think in all fairness that we should be permitted to see both sides of the account; not that we wish the Check Department to place both the discrepancies on one sheet, and charge or credit us with the difference, as the case may be, but that they make out two slips and thereby enable us to ascertain with greater facility the amounts which we *must* sometimes inadvertently overcheck ourselves.

We do not wish to use these errors beyond what is right and proper to an equitable settlement of our accounts, and will expect to return vouchers and explanations for mistakes in our favor as well as for those against us.

No one will, we think, venture to say that such errors never occur; for one of us, at least, has purposely and on several occasions overchecked himself small amounts, and that was the last of it.

BATON ROUGE.

NOTE.—The immense labor of the Check Depart-

ment has compelled the adoption of the Government system of checking only errors against the Company, leaving managers to look out for errors against themselves, which are always allowed when proved. Thus both sides are left to watch their own interests, and with equal facilities for ascertaining the facts, besides economizing labor. To do more than this would require double the present force in the Check Department and would not be so promotive of care as the present arrangement. Such, at least, is the opinion of those whose long experience entitles their judgment to acceptance and adoption.

## Personal.

Cyrus W. Field returns from Europe on the *China*, about the first of November.

Messrs. Webb and Morse have been added to the night force of the Western Union office, Cincinnati.

Mr. Charles Taylor, formerly of Adams Express office, Cincinnati, has gone to Memphis.

W. H. Stanton, of St. Louis, has accepted a position as night operator at Hillsboro, Ill.

W. P. Baker, who went to California some time since, has returned to Cincinnati, not liking the way of the people on the Pacific coast.

S. P. Peabody, a favorite Cincinnati operator, has resigned for the purpose of entering other business.

Charles Kelley, of the Western Union Company's Schenectady office has been obliged to go home on account of illness. His position is being filled by H. A. Brasie, of Sherburn, N. Y.

W. D. Phillips, late night operator at the bridge office, Albany, has accepted a position in the freight office, Syracuse. D. W. Daley, of Huntington, Mass., is his successor.

W. B. French, late of New York, is filling the place of Teneyck Fonda in the Fonda, N. Y., office for a short time.

F. Evans, late with the A. & P. Co., has accepted a position with the Western Union Company in their Albany office.

H. M. Hoffman, Manager, Frederick, Md., resigned Sept. 1st, and J. F. Morrison appointed Manager of that office.

W. J. Bassett, Manager, Cheshire, Conn., resigned, and P. G. Payne has been appointed in his stead.

Office at Cohasset, Mass., reopened Sept. 7th, A. B. Churchill appointed Manager.

Office at South Dennis, Mass., opened Sept. 1st, L. B. Nickerson appointed Manager.

Jas. B. Crocker, Manager, Yarmouthport, Mass., resigned Sept. 1st, and Miss Celia E. Davis appointed in his stead.

## Electric Clock in London.

A remarkable clock has been erected for public use at the top of the offices of the Liverpool and London and Globe Insurance Companies, at the junction of Cornhill and Lombard streets, where it forms one of the most conspicuous objects to be seen in the city. The *Mechanic's Magazine* contains the following description of it:

"The object of the Electric Clock Company, by whom it was erected, was to make the 'globe' do duty as a clock face; some of its convexity has, therefore, been sacrificed, but the result is a novel and beautiful object, the interest of which is only exceeded by its utility. The globe is surrounded by gilt stars which indicate the hours, and by the shape of the dial so much light is thrown upon them that they are visible by night and by day, while the pointers contribute greatly to the general effect of the design. The clock requires no winding up. The dial is illuminated by Schaeffer's patent double burners: and by an ingenious apparatus the gas is turned off every morning and evening two minutes earlier and two minutes later every day as the days are lengthening or shortening, and it is adjustable as well for the foggy days of November as for the light nights of summer."

## He Does Insure.

"Insured!" "insured!" dear me, I think  
Your tongue would some day stop  
From always running on this theme,  
Do let the matter drop!  
You very soon will grow to be  
As much a bore as Doan,  
Who is a first-rate sort of chap,  
But always "on the loan."  
It used to be, "Say, Tom, my boy,  
Just let me have a V  
A day or two; I'll do the same  
Sometime you ask of me."  
Then, soon, he used to ask an X  
And other little sums,  
Until his face would make such thoughts  
As, "Here that fellow comes!"  
And now I shun him like the plague  
For fear he'll ask for more,  
And always as he enters one  
I leave the other door.  
But I "won't listen," won't I? ah!  
Why don't I hear enough?  
You're always talking of this thing  
And giving it a puff.  
"Don't know a thing about it," la!  
Now really that is good!  
I guess there is not much of it  
Worth being understood.  
Cheap? y-e-s, no doubt, a dollar, and  
Another half to that,  
And then a dozen deaths a year,  
I'd sooner buy a hat.  
Or else a pair of "patent" boots,  
Gloves, perfume for the hair,  
Or else some like extravagance—  
Bah! I'm no millionaire.  
What's that, "I have no charity?"  
I say that is not true;  
For that is just one reason why  
I'll not give ear to you.  
Why, boy, I live on salary,  
And still my money goes  
So fast to widows, beggars, alms,  
And what else goodness knows.  
Until my wife dines in my ears  
"Save! save!" and beggars "give!"  
And what to do between them both  
I know not as I live.  
"I ought to try economy,  
Or I'll be always poor;"  
That's very fair advice, I think,  
So I will not insure.  
"Save for the future, too." How's that?  
Pray just be good enough  
To tell me how with my stipend  
You'd pay heed to such stuff?  
"Insurance is the simplest mode,"  
"Spend Charity in that."  
Oh, that's it! eh! at last I know  
What you are driving at!  
Hm! yes, I see, upon my word  
That shows it in new light,  
How selfish I have been indeed,  
My boy I think you're right.  
I'm always ready (*thus*) to own  
When I have been a dunce,  
Let's see, eight shillings—twelve—now there!  
Put down my name at once.

LOGANNE.

## Cooking by Sunlight.

The *Scientific Review*, speaking of the extraordinary heat and drouth experienced in England, says: "The southerly winds have prevailed for an unusually long interval, and the weather has consequently been very hot and very dry. On the 22d of July it was possible to cook a beef steak on the south side of Westminster Bridge by the heat of the sun's rays alone. The apparatus employed was of a very simple kind: it consisted of an empty cigar box, the inside of which had been blackened, and the top closed with three panes of glass about one inch apart. In the course of twenty minutes the steak was done on both sides, while a few potatoes were baked around it."

Mr. Brooks has contracted to insulate the wires of the Western Union Telegraph Company between New York and Harrisburg, and is now engaged on that work. After so many years' study, with the added experience of other inventors, he can scarcely fail to accomplish his undertaking successfully.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month commencing with December 1, 1887. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address— JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, OCTOBER 15, 1888.

### Wise at Last.

With the restoration of the cable of 1866 comes a new proof of advancing civilization in the abrogation of the rule by which a word was understood to be five letters. An order, which will be found elsewhere, directs that after November 1, words will be counted as such irrespective of the letters they contain, and thus "wheat" and "whisky" will be sent for the same price. John Bull is a very slow gentleman and stubborn in his ways, but is capable of enlightenment, of which we regard this new order as a cheering indication.

### Cook's Telegraph.

We have before us, as we write, some very beautiful specimens of printing by Cook's improvement of the late Gaetano Bonelli's automatic printing apparatus, just received from Paris. The printing is done in fine bold letters, the words well compacted and spaced, and printed—not on a continuous strip, but line under line as in a printed circular. It is certainly a very admirable result, and indicative of a perfection in telegraphy and a use of the subtle powers of electricity which must enhance the acceptability of the telegraph to the public. The great advantage of the autographic process is that it renders error next to impossible, or rather, that it does not leave to the action of outside causes, or the use of arbitrary characters whose relations to each other may be misunderstood, or to the vagaries of an operator's brain as he manipulates his messages, letter by letter, the opportunity to change their composition. The message is set up and compared before it is transmitted, and if it goes at all, must go exactly as first prepared.

The paragraph before us is one of 35 words, transmitted in 20 seconds, a speed equal to 315 messages of 20 words each per hour. This fact is suggestive of a future in which the entire labor of our offices will be changed, and the operation of transmission become simply mechanical and comparatively unlaborious. We will not be surprised if, in time, parties, who prosecute much of their business by telegraph, should supply themselves with telegraphic type, arrange their messages for transmission in a case adopted for that purpose, prove them before sending to the telegraph office, and the operator have nothing to do but pass them through the manipulating instrument. By such processes as these only can large quantities of matter be sent over the wires without the fatigue connected therewith, and, what is equally desirable, with the utmost assurance of correctness which mechanism can afford.

THERE was never more inventive activity in telegraph appliances than now. Of insulators there are several new forms. Of City Broker telegraphs we hear of half a dozen. Mr. Phelps and Mr. Boyle are perfecting printing instruments of increased capacity and simplicity, and many other devices are occupying the attention of busy brains.

### Meteorological Observations.

There is an increasing desire apparent to adopt some system by which our great atmospheric changes may be watched and grouped. Europe has long cultivated this interesting field, and we have before us one of the circulars by which is conveyed, in a neat and easily understood formula, the direction of the wind at various points, the state of the thermometer, and all those indications by which changes are prognosticated. It is in the form of a map, embracing the shores of England, France, Spain, Denmark, Norway, &c., and is largely circulated.

The Telegraph Companies in the United States have, without charge, published, from time to time, the state of the thermometer and weather at numerous and far separated points, and have hoped thus to attract the notice of men of science and the department of Government to which such an undertaking would naturally be given, to the establishment of some well-considered system by which these observations could be utilized. To some extent attention has been aroused. Prof. Henry, of the Smithsonian Institute, Prof. Abbe, of Cincinnati, and others, are anxious to inaugurate measures to accomplish in the United States what has been so useful in Europe. We hope something practical and possible may soon result. The conformation of our country, the extended coasts both on the Pacific and Atlantic, to numerous points on both of which the wires extend, make this the finest field which the world presents for meteorological observations. The undertaking should, however, take some national form, and Congress should aid in its introduction. Whenever such a scheme is perfected, the Telegraph Company is ready with its wires and men to perform its part in such a work liberally and effectively. The intelligent communication of Engineer Donnelly, whose articles in the *N. Y. Herald* have been extensively read, is a contribution in the same direction, for which we thank him.

### Telegraphers' Insurance Association.

It must be very gratifying to the members of the Telegraphers' Mutual Insurance Association to know that during the first year of its organization, now nearly closed, it has afforded genuine relief to the relatives of two of its members. We have already referred to the case of Seba B. Christie, to whose widowed mother the prompt payment of his policy was a comfort and relief. Mr. Hall, who was killed by a fall the night succeeding Christie's death, left the avails of his policy to a younger sister to whom it comes as a token of brotherly affection and an aid to her in her own struggles, much needed, and highly prized.

On the whole, the payment of the double assessment which these deaths occasioned has been prompt and satisfactory. Some have withheld payment through inability, and some because, as is always the case, earnest giving loses its relish. The places of these delinquents have, however, been more than supplied by additions, some 70 members having been added to the list since the assessment was made, while not over a third of that number have withheld their dues.

We commend again the association to all the fraternity, and trust to see its numbers largely increased.

WHATEVER may be said of the Morse alphabet, the fact of such a mass of work daily transmitted over the wires without, or with so few errors, is the highest testimony of its merit. We have desired the change of the c and r, and perhaps one or two other letters, but the successful use of the present form lessens the necessity. We do want, however, to have brought into use an autographic telegraph writer. In that we confess to have great interest, and desire to see its successful introduction.

### To the Members of the Telegraphers' Mutual Life Insurance Association.

The second annual meeting of the Association will be held at 145 Broadway, N. Y., on Monday, Nov. 2d, at 5:30, P.M. The terms of the present officers will then expire, and new ones will be elected for the ensuing year. Members living at a distance, who may wish to vote, may send their proxies to the Secretary. Full reports of the condition and prospects of the Association will be presented.

D. R. DOWNER, Secretary.

### The Broken Cable Repaired.

LONDON, Oct. 12.—The Direction announces that the cable, known as the 1866 cable, between Ireland and Newfoundland, was repaired at 4 o'clock Sunday afternoon, and is now in perfect working order.

### Too Bad.

A message passing through the hands of a lady operator addressed to

"A. Gillespie, Clerk, Steamer Magnolia,"

was ungraciously written off as follows:

A. Gilles,  
Pie Clerk,  
Steamer Magnolia.

Now that is too bad, and must have been perpetrated somewhere toward noon when pies are warm and in demand.

On the same day a male operator slandered one of our "truly loyal" counties, by addressing a message to "Jacob Smith, Whitesboro, *One idea Co.*, N. Y." That is as bad as the pie.

A MAN, very impatient about a pair of boots he had ordered, sent a message by telegraph to know "if the calf of that cow had yet been born out of whose hide his boots were expected to be made, and if not, why not, and when might the event be expected."

MR. WILLIAM WHITE, an operator in the Western Union office in Buffalo for some time past, died at his home (Dunnville, C. W.) on the eve of the 25th ultimo. Mr. White was much respected by all who knew him, and many mourn his loss.

THE enthusiastic article about the great discovery at Memphis, which has been in type for the last two or three months, waiting its chance for publication, is the work, of course, of a friendly editor, who wants to make the most of a very simple and, where conditions favor it, a very good thing. Alexander Bain worked in 1844 a printing telegraph between London and Wimbledon, some six miles, with no battery except a zinc plate at one end and a copper plate at the other. It requires moist earth to make it effectual, and we would like to see offices make the experiment to see how far they can use these simple elements, noting the power developed, and the rate of decomposition.

THE Manhattan Telegraphic Institute, 20 Fourth avenue, New York, and 219 Fulton avenue, Brooklyn, is under the direction of Parker Spring, one of the oldest telegraphers of the country, a good, genial fellow, who has seen telegraph life in all its phases. We think it was he who managed the balloon for observation for the Army of the Potomac, and has probably been higher up in the air than any other telegraph man, although some of them are still occasionally knocked "higher than a kite." Mr. Spring deserves success, and is abundantly qualified for the work he has undertaken. He used to be good in overtaking a train, and is not much the worse for twenty years' active service.

**Telegraph Base Ball Clubs.****OWLS AND DAYLIGHTS.**

The base ball season being about to close we have been furnished the following scores of games played by the "Night Owls" of Cincinnati lately. They made a trip to Lawrenceburg, Ind., on the 15th of September, and played a game with the Enterprise of that place, being badly defeated by a score of 54 to 19. The Enterprise boys treated the Owls to a fine dinner, and the game was of the most friendly description. Subsequently the Owls beat the Osceolas of Cincinnati by a score of 19 to 9, and played a tie game with the Daylights, the score being called at the end of the fourth inning to enable the Daylights to get to work. The St. Louis telegraphers suffered a Waterloo defeat at the hands of the Atlantic third nine—score 64 to 18.

**The Association for the Prevention of Gambling.**

Its object is to save employees and others by keeping detectives in gambling houses, who report all who go there to their employers, and publish in all daily papers a monthly report, which warns them to keep away. It has closed up 318 houses in this way in the last six months. Most of the large houses in New York employ this Association, and no employee can long evade detection whose practices are dishonest or whose habits and haunts excite suspicion.

ROCKFORD, ILL., Oct. 7, 1868.

To the Editor of the Journal of the Telegraph:

A few days since a lady whose ancestors evidently had hailed from Cork, stepped into my office, requesting me to "sind a missage to Mishter Quigly for some money." After no little trouble in dotting it down to her satisfaction, check fixed, &c., she turned to leave, when an idea seemed to strike her. It struck me, too; I have scarcely recovered yet. She exclaimed: "Say, Mishter, can't yeess jist tell Mishter Quigly to sind a missage back, and sind the money in the missage?" This upset my gravity, and I gravitated toward my frugal meal, with a much improved appetite from the merry humor into which my practical Hibernian customer had thrown me.

Yours, H. D. S.

THE automatic process in transmitting messages seems to be quite successful in England. We suppose this to be the punching process, by which messages are first punctured on paper and then rolled through under a connecting stylus.

MOST of the marriage notices sent to us are carelessly written. We are willing to credit this to the bewildered state of the parties concerned, but wish there could be some improvement. A signature to the note requesting publication is always necessary.

**BORN.**

September 27, to N.H. Rugg, manager of the Saratoga Springs office, a son.

**MARRIED.**

At the residence of the bride's parents, on Wednesday evening, September 30, by the Rev. John E. Cookman, W. W. Burhans to Ella E., only daughter of G. V. Rellay, all of New York city.

In Trenton, N. J., September 10, at the United States House, by Rev. Mr. Perry, L. R. Beers, operator Western Union Telegraph Company, Washington Crossing, N. J., to Miss Lucy Weller of Mauch Chunk, Pa.

Wood's Hole, September 17, in the Church of Messiah, by Rev. H. Carleton, Capt. Benj. Dexter, of Holmes Hole, to Miss Sarah L. Hinckley, daughter of Capt. Thos. Hinckley and Manager of the office of the Western Union Telegraph Company at that place.

**DIED.**

In Brooklyn, on the morning of the 9th instant, the infant daughter of W. W. Shipman, aged seven months.

In Albany, September 29, of consumption, Richard Gay, late manager of the Western Union Company's West Troy office, in the 27th year of his age.

**TARIFF BUREAU.****Semi-Monthly Circular.**

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
October 15, 1868.

To all Offices on W. U. Lines—

ATLANTIC CABLE BUSINESS.—LETTER COUNT ABOLISHED.

We are notified by the Atlantic Cable Company that on and after November 1, 1868, messages will be counted by words only, without reference to the number of letters.

The following changes have occurred since Sept. 15, the date of the last Tariff Order. Please note them in your Tariff Book:

**NEW OFFICES.**

Charles City, Minn., tariff same as Naahua, Iowa.  
Ghent, N. Y., tariff same as Chatham, N. Y.  
Gosport Depot, N. Y., tariff same as Suspension Bridge, N. Y.  
Greenwich, or Union Village, N. Y., tariff same as Cambridge, N. Y.

Hilliards, O., tariff same as Columbus, O.  
North Platte, Neb., tariff same as Ft. McPherson, Neb.  
Ononwa, Iowa, tariff same as Liberty, Iowa.  
Victor, Iowa, tariff same as Brooklyn, Iowa.  
Washington, Iowa, tariff same as Iowa City, Iowa.  
Wetumpka, Ala., tariff same as Montgomery, Ala.  
New Canaan, Conn., reopened, tariff same as heretofore.

**OFFICES CLOSED.**

Kingston Springs, Tenn., Allegheny Springs, Va., and Beverly, Mass. Messages for Beverly will be checked to Salem, Mass., adding 25 cents for delivery.

**GENERAL INFORMATION.**

Hereafter all business for the following points in Cape Breton Island will be checked to Plaster Cove, N. S., at the rates here given.

The amount to be collected, whether on a message sent or received will be the "currency rate."

If a message is sent paid or collect it should be checked at "gold rate."

19 BROAD STREET AND 57 EXCHANGE PLACE,  
NEW YORK.

Stocks, Bonds, Gold and Government Securities bought and sold on Commission.

S. S. STAFFORD'S

COMBINED

WRITING AND COPYING FLUID,

Labelled by me, for the last ten (10) years, ARNOLD'S FLUID

Superior to any Fluid used. It is Greenish Blue in color, turning Jet Black, flows freely, dries rapidly, does not set-off in books, gives one or more excellent copies. Has no sediment, can be used to the last drop. It is 35¢ per cent. cheaper than any other (so called) combined ink. Used exclusively by the Western Union Telegraph Company.

For sale by all Stationers and Druggists, and at No. 11 Cedar street, New York.

S. S. STAFFORD,  
Chemist, N. Y.

**AMERICAN COMPOUND TELEGRAPH WIRE.**

SUPERIOR CONDUCTIVITY.

LIGHTNESS AND DURABILITY.

A MOST IMPORTANT IN

We would call the attention of Officers of Telegraph Companies, Telegraph Builders and Contractors, and the Public, to the new

PATENT COMPOUND TELEGRAPH LINE WIRE.

Manufactured by the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY,  
OF NEW YORK.

This Wire has already been put up on sections of several Telegraph Lines, and its merits fully tested, and the results show that it combines all the good qualities which are claimed for it, viz., Economy, Superior Conductivity, and Increased Strength, with Decreased Weight of Metal.

In its composition are used three metals, either of which is a good conductor, Steel, Copper and Tin; and the superiority of Copper as a conductor over other metals is well known, and but for its ductility rendering its permanent suspension in a pure state intact impracticable, it would have always been used exclusively as a Conductor on Telegraph Lines. By combining it with Steel the desired strength and permanence is attained, and the necessary weight of the line wires reduced two-thirds, thus obviating the necessity for using a large number of poles to the mile, and by reducing the points of contact, lessening the chances for trouble and escape of the electric fluid.

All other Line Wires must inevitably be superseded by this, and such Telegraph Companies as now adopt it will the sooner realize the advantages to be derived from its use over those whose lines are of the old rotten and rusty iron wire pattern.

For further information, call on or address

Sole Proprietor, N. Y.

## Curious Telegraphic Phenomenon on the Mississippi.

### The Theory of Submarine Transmission Without Wires.

[From the Memphis Appeal, October 7.]

A case of local interest has lately come under our observation which has caused electricians here no little perplexity. We allude to the late obstruction and restoration of telegraphic communication with the trans-Mississippi. For some weeks past the cable has been working very irregularly. At intervals no communication could be had for hours, and all at once it would revive and the fluid would pass through it as usual. This state of affairs continued for several weeks, and at last communication ceased entirely. After several ineffectual attempts to revive it, it was determined to raise it and find out the reason for the cessation. The cable crossing at this point is considered one of the best ever laid in this country, having been manufactured originally for the Red Sea, but for some reason not used, and afterwards was purchased and laid down by the Western Union Telegraph Company, at a very heavy expense. The operation of "under running" and taking the cable up was successfully performed by Colonel Coleman and Captain Baker, in a steam tug with a barge attached. As it was raised, and at intervals of a few yards, a needle was driven into the cable so as to touch the conducting wire, and instruments were applied to test the soundness of the portion raised. When near this shore by this means it was discovered that the disturbing cause lay within a space of twenty yards between two points. This piece was cut out, the two ends spliced and the cable immediately worked throughout its whole length. The piece cut out was brought ashore and examined by Colonel Coleman and Captain Baker at their leisure, and developed one of the most singular facts in telegraphing that has ever come under their notice. On cutting the cable it was found that about four inches of the conducting wire had been burned out, and was gone completely. It is supposed that a severe shock of lightning had passed along the land line of wires, and had left them and followed the cable, burning this piece out in its passage. The curious and inexplicable part of the affair is the action of the cable after the burning. At times a current of electricity passed through, and communication was kept up between Memphis and Little Rock; then ceasing entirely for awhile, it would again revive, keeping up this fitful action, as we have stated, for some time before its total suspension.

Many theories and surmises are advanced by the gentlemen connected with the telegraph office here as to the explanation of this remarkable phenomenon, the only one of which is at all satisfactory is that of Colonel Coleman: That "a slight connection was formed between the burnt ends of the conductor by moisture which had penetrated the cable in sufficient quantities to keep up the circuit, there being a battery on the Memphis end strong enough to drive the electricity through at intervals." This, says Colonel Coleman, to whom we are indebted for most of the above facts, is a remarkable case and may never occur again. The question now naturally suggests itself, cannot some mode be established whereby communications can be passed through large bodies of water without a cable? It has been proven in this instance that messages passed to and fro across the Mississippi without a metal connection. Let the scientific work it out.

This case is analogous to that of the Atlantic cable in 1857, in which were parts found where connection had been broken, and yet which had worked in the spasmodic manner so familiar to all who took interest in the record of that interesting attempt. The wire of the Memphis cable could not have been consumed without leaving more or less of metallic remains, either in particles or on the surface of the gutta percha which inclosed it or in vapor. Could moisture have entered, communication would not have been broken, although it might have been defective. The effect of the current would seem to be to increase the dryness of the chamber, if indeed any moisture could have been present, and the strength of the battery, in time, may have consumed the metallic surface or vapor which remained. There is no proof as suggested, that the current passed without metallic connection, and there is a great difference between water inclosed in an insulating tube and the water of a river where no such inclosure is possible.

### Electrical Novelties.

Man has lately entrapped electricity into a great many curious functions. Of its public services we need hardly speak; telegraphs have become too familiar to be longer regarded as curiosities. There have been difficulties in the way of getting a good

and cheap source of electricity, which have barred the way to their extensive introduction; but some of these are removed, and we may entertain better hopes for the future. A celebrated London photographer has erected a magneto-electric machine for conducting some of his operations which require an intensely bright illumination, and has thus apparently become independent of the sun: in reality, he is using the solar rays which came to our planet thousands of years ago, for what is coal but "bottled sunshine?" A Birmingham electro-plating firm also set up a similar machine for depositing their precious metals; and a sugar refinery another for generating ozone to bleach sugar. An ingenious inventor has proposed to illuminate buoys and beacons by electricity, and a French firm has offered to light the English channel by the same means.

Quite recently M. Blondeau brought before the French Academy of Sciences the results of some experiments for ripening fruits by electricity. He electrified apples, pears, and peaches, all of which ripened under the influence of the fluid, while other fruit on the same trees remained far from ripe. He electrified seeds and grains by steeping them in water and submitting them to the action of a powerful current. Peas, beans, and wheat were so treated and sown in good soil. By the side of them were sown similar seeds not electrified. The former sprouted sooner than the latter, developed more rapidly, and were more vigorous. Most mysterious of all, some electrified beans grew upside down, the roots in the air and the stem in the soil.

The most curious application of the electric light was that attempted lately at one of the Paris theaters. The actors were decked with glittering crowns, and, to add to their brilliancy, they were so made that a chaplet of electric sparks encircled the wearer's head, the necessary current being supplied and led to the coronet from a concealed battery. But the "sensation," pleasing enough doubtless to spectators, painfully verified the truth of the Shakspearian maxim touching the uneasiness of the head that wears a crown, for one of the performers was grievously injured by the passage of the current through his or her head, instead of through the star-spangled ornament. Not quite so striking, but still curious, are the electrical jewels made by MM. Thouve and Cudet-Picard. These consist chiefly of scarf pins and brooches, representing heads of men and animals which roll their eyes and work their jaws. Some are in the shape of tiny soldiers which beat drums, rabbits that play on tambours, and birds that flap their wings and fan their tails. They are worked by tiny electro-magnets concealed within them, and connected by fine wires with little batteries carried in the pocket or elsewhere about the dress.

### A "Tell-Tale" Apparatus.

At the vast establishment of Dolfus, Mieg & Co., are four night watchmen, and they have to make ten visits to ninety-three stations, in all 930 visits. On commencing his rounds a card is delivered to each watchman which he carries about with him. At every station he has to visit is a frame the size of the card, at which, at a given time, a stamp presents itself and impresses a mark on the card. The marks are so arranged that when the whole are printed they form one complete design. Any delay or omission on the part of the watchman leaves a blank space on the card, which tells the hour at which the man failed in his duty. When going off duty, the men push their cards into a kind of letter-box, and as this is done the exact time at which they are delivered is printed. All this contrivance is completely beyond the men's control, and there is no possibility of tampering with the mechanism.

CON.—What two ladies are always to be found in telegraph offices? Mag n Et.

### An Alarm.

We have in our house a little invention which we have several times noticed in other dwellings, but having no direct interest in its operation we have not paid much attention to its working. It is a little thing, and stands upon a little shelf in our sleeping room; but in an emergency it is capable of making a good deal of noise, and imparting useful information. It is an electric alarm, with wires entirely concealed from the eye, and which run from it to the doors and windows and scuttle of the house; and should any of these be disturbed, the alarm is at once sounded. By means of a "tell-tale" it can be ascertained at once in what part of the house to look for the disturbance.

The other night, before retiring to bed, we had the assurance of the servant that everything was close and secure. We set the alarm, but instantly it set to ringing, and we knew that something was wrong, and upon examining the "tell-tale" we found out where to look for the cause. The laundry window was dropped about an inch, and the little machine would not keep still until the matter was made right.

By the use of this little apparatus, thousands of dollars' worth of property have been saved from burglars.

### Bridging the Great Rivers.

It is only within a few years that the project of bridging the Mississippi, or any of the larger tributaries, has been thought at all feasible. But the public have lately acquired a passion for bridges. A bridge over the Ohio was completed a little over a year ago, at Steubenville. A bridge at Wheeling, to connect the Baltimore and Ohio and Central Ohio railways, was built some years ago. A third bridge is under way at Parkersburg, to connect the West Virginia and the Marietta and Cincinnati railroads. A fourth bridge has just been completed at Cincinnati, at a cost of \$1,750,000. A fifth bridge is projected at Louisville. In addition to those built and projected over the Ohio, the largest tributary of the Mississippi, the great "Father of Waters" itself is to be bridged at Dubuque, Galena, and possibly at St. Louis. We live in a fast age. The people cannot wait "to be ferried over the stream," but prefer to walk over it hastily and "dry shod."—*Industrial Gazette*.

### Great Discovery—Wonderful Improvement.

For months past we have longed to lay before the public the fact that a most wonderful discovery had been made in the art of telegraphing by two of our fellow citizens, George M. Dugan and Booker Ford, and Col. Coleman, of Memphis; and shall now proceed to record what we have seen in operation at the telegraph office in this place for weeks past. The discovery made does away with all the jars and fluids heretofore used in telegraph offices, and a current of electricity sufficiently strong for all purposes is drawn from mother earth by means of one sheet of copper and one sheet of zinc, which are buried to the depth of two feet, and having about four inches of earth between them. To the copper plate wires are attached, and the current thus procured seems inexhaustible. The operators at the telegraph office here long since dispensed with fluids of all kinds, and every message sent from Bolivar now is recorded by an instrument which receives its power from the buried battery, and which consists of nothing but one sheet of copper and one of zinc. The inventors have applied for a patent, and it is hoped that their prayer will be speedily answered, as this discovery of theirs is destined to work a most wonderful change in the art of telegraphing. Hereafter, we shall endeavor to give a full and complete account of this truly great discovery, and are proud to say that to Hardeman county belongs the credit. —*Bolivar Bulletin*.

**Telegraphers'****Mutual Life Insurance Association.**

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postage, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

J. D. REID, Treasurer.

**DIRECTIONS TO APPLICANTS.**

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

By permission of the Western Union Telegraph Company, and to avoid risk by mail, remittances may be made by an order signed by a Manager on John Horner, Cashier, New York office. Whenever practicable it is desirable this should be done.

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed.

His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them.

Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1853. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1/300th of an inch, the helix is surrounded by thin paper. In helix of silk insulated wire the space occupied by the silk is the 1/150th to the 1/300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

PRICES.

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	18 00
Main Sounders same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Key.....	22 00
Excellent Registers.....	10 00
Pony Sounders.....	6 25
Key.....	6 50

All other appliances made to order. Extra speeds for replacing such as may be spoiled by lightning, furnished at \$1.35 each. Old goods taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package.

He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers prices.

PATENT PARAFFINE INSULATOR WORKS.

No. 22 SOUTH TWENTY-FIRST STREET.

PHILADELPHIA.

All varieties of INSULATORS manufactured at these Works are warranted to excel the usual style of Glass and Rubber more than one hundred fold. In view of the error and delay in transmission, waste and consumption of battery material, the results of defective insulation, its fragile

nature and expense of renewal, nothing is more manifest than its economy.

To RAILROAD COMPANIES relying upon the efficiency of their telegraph departments it is of great value.

# JOURNAL OF THE TELEGRAPH.

NO. 24.

NEW YORK, NOVEMBER 2, 1868.

VOL. I.

## MEMORIES.

PORTLAND, Me., Oct. 23, 1868.

DEAR SIR—While reading your reminiscence in the last issue of the JOURNAL, I was reminded of several hair breadth 'scapes and comical incidents which have occurred within my own experience, one of which I will give you. If you like now and then an off-hand sketch, I shall be happy to contribute.

In the month of April, 1857, a fearful gale sprang up one Sunday night, which prostrated the wires between Portland and Bangor, in a most discouraging manner. Taking a crew of men with the necessary materials, I started from Bangor on the early train, dropping a man at the stations as we went along, to foot it back and mend the break. I saw some fifty breaks within 75 miles, besides numerous crosses and trees on the wires. When I arrived at Lewiston, something over 100 miles from Bangor, I ran to the office and found it was O. K. to Portland. I at once telegraphed repairman Pierre to take the train and go through to Waterville without stopping, and I would meet him on his arrival there. This Pierre was a model repairman—always ready and willing, and not only anxious to do two men's work in a day, but generally did it. I had just time to jump on to a freight going East, and, as luck would have it, business was light that week on the road, and I pressed the conductor and engineer into service. They stopped the train at every break and helped me repair, and, when the regular passenger train overtook us near Waterville, I jumped on board, and, in a few moments found the wires were O. K. to Waterville. As soon as possible I obtained a hand car, and hiring a couple of Frenchmen to propel it, started with Pierre for a night "raid." It happened to be a bright moonlight night, the only one during that whole moon.

About midnight we were between Clinton and Burnham. The Frenchmen were clearing a heavy tree from the wires, and Pierre was some distance in advance, on top of a pole. I was near by, endeavoring to extricate the wire from a mass of roots in which it had become entangled, when I was startled by a crackling in the woods, like the stealthy tread of some heavy animal on the dry twigs. Involuntarily grasping my hatchet, I stood with ears and eyes wide open, and as, I peered around, I caught sight of what seemed to my excited imagination to be two black heads slowly and cautiously appearing above the clump. I thought to myself, "here is a situation for the father of a family!" It was of no use to run, for, as it appeared to me then, there was the bare (bear) fact of eight legs against two; but, as the black heads emerged and their bodies came into view, I saw that they were not bears at all, but two good-sized boys. The next instant I was horrified by seeing them raise their guns and take deliberate aim at Pierre, who was away up on the pole, quietly attending to his business, and utterly unconscious of the danger which menaced him. Like lightning it flashed into my mind that they took him for a bear, and I gave a yell which must have astonished all who heard it. It had the desired effect, however, and I came out of the wood and

explained to the boys that it was a "human" up that pole, and that I objected to their giving him a double dose of blue pills, as I didn't think his diaphragm would stand it.

Pierre was in a high state of wrath when he discovered how near he had come to having his connection broken, and he delivered a small speech from his cedar pulpit, which was anything but complimentary to the moonlight hunters. He advised them to go back to their muskrat hunting, and not attempt to shoot bears with homœopathic pills. The boys apologized to the best of their ability and flitted.

It was a narrow escape, but we could not stop to moralise. We kept on with our work, and made twenty miles that night, removing some fifty trees from the wires, and mending numerous breaks. At half past 10 A.M. we had the satisfaction of feeling the current both ways, and knowing that the wires were in working condition through.

B.

## Correspondence.

### The Earth Battery.

To the Editor Journal of the Telegraph :

In your JOURNAL, of the 15th October, you give an account of an experiment from the *Bolivar Bulletin*, by Messrs. Dugan, Ford and Colman, under the caption of "Great Discovery—Wonderful Improvement." The editor of the *Bulletin* was doubtless ignorant of the fact that the experiment is not new. Prof. Morse, as Director of the Telegraph, directed Mr. Vail, in the year 1844, to make some experiments which he had conceived for the purpose of ascertaining the minimum of battery power necessary for operating the telegraph.

Mr. Vail, in his published account of these experiments, at pages 43 and 44 of his work, says:

"The first experiment made was to ascertain the number of cups absolutely required for operating the telegraph. Eighty cups had been in use. Upon experiment it was found that two cups would operate the telegraph from Washington to Baltimore. This success was more than had been anticipated, and urged on further experiments, which eventually proved that the earth itself furnished sufficient galvanic power to operate the electro-magnet without the aid of a battery. In the first experiment a copper plate was buried in the ground, and about three hundred yards from it a zinc plate was also buried in the ground. To each of these plates a wire was soldered, and properly connected with the key and electro-magnet of the register, the battery not being in connection. Upon manipulating at the key, it was found that the electro-magnet was operated, and the pen of the register recorded. This led to another experiment on a more magnificent scale, nothing less than that of using a copper plate at Washington and the zinc plate at Baltimore. Here, too, success followed the experiment, though with diminished effect. By the application of a more delicate apparatus the electro-magnet was operated, and the pen of the register recorded its success. From these experiments the fact appears conclusive that

the ground can, through the agency of metallic plates, constantly generate the galvanic fluid."

Mr. Vail, in a note on the same page, says: "Mr. Bain, in 1840, was the first to use the ground as a source of electricity in conjunction with its conducting power as a circuit, and Mr. Vail, in an experiment in 1844, succeeded in operating the electro-magnet, with its armature attached to a lever, without any battery"—that is, ordinary battery. The fact, therefore, that a battery (for it is a battery) can be constructed by burying the positive and negative plates in the ground is not new. But its practical application, that is, its advantageous use for telegraphy, is by no means clear. The galvanic effect is in proportion to the consumption of the zinc, as in the ordinary battery, and it is doubtful if the power of such a battery is generated, and the consumption of zinc used in the most economical manner, by this arrangement.

TEL.

PROFESSOR WHEATSTONE has received the honor of Knighthood.

Additional Honors to Prof. Morse from Denmark.

In another column we have alluded to the fact that England claims the position of having "given the modern telegraph to the world." The honors conferred on the American inventor of the telegraph by all other nations except England, would seem to prove very conclusively that her claim is not acknowledged out of her own dominions. There are few Americans who have received so many honorary proofs of the regard of the principal nations of Europe as Prof. Morse. The usual mode of honorary acknowledgment, is by a decoration electing to a position in some of the honorary orders. Prof. Morse has received from different sovereigns no less than six decorations. The *Nishan Iftichan* from the Sultan of Turkey (or order of glory); the cross of a *Chevalier of the Legion of Honor* from the Emperor of the French; the cross of a *Chevalier of the Order of St. Maurice and Lazarus*, from the King of Italy; the cross of *Chevalier of the Order of the Tower and Sword*, from the King of Portugal; the cross of a *Knight Commander (de numero)* of the order of *Isabella the Catholic*, from the Queen of Spain; the cross of a *Chevalier of the Order of the Dannebrog*, from the late King of Denmark; and the intelligence has just reached us that Prof. Morse has been promoted to be a *Knight Commander* of the first class in the same order by the present King of Denmark, Christian the IX.

In Austria, Prussia and Wurtemberg also, the sovereigns of those countries have conferred upon him the *Scientific Gold Medal* of their respective nations, and in 1858 a special congress by ten of the European nations was convened at Paris at the instance of the Emperor Napoleon, to devise a collective mark of acknowledgment to Prof. Morse, which congress, under the presidency of the late Count Walewski, voted him, as an honorary gratuity, 400,000 francs. These facts at least show that the American invention is magnanimously acknowledged on the continent of Europe.

## Telegraph Keys Once More.

To the Editor of the Journal of the Telegraph:

DEAR SIR: It is now some nine months or more since your correspondent first opened the discussion of telegraphic keys. The very considerable attention which has been given to the matter is my excuse for returning to it again, for I am anxious to shield the subject from the distrust which will inevitably overtake it if the present line of action be long pursued—distrust on the part of the profession, and disgust on that of the inventive genius which is now running riot and to waste.

It is unreasonable to expect the exclusive adoption of automatic circuit-closing keys, for on through lines they would possess no advantages which are not now obtained by the ordinary instrument, and would have to combat the prejudice natural to the introduction of a new and untried article. Hence, I am not in favor of a sudden and radical change in so important a part of the Morse mechanism as the key, as some of my friends appear to be, and hence, also, the pleasure which I take in introducing to your readers the circuit-closer designed by Mr. E. W. Ingraham, manager of the Pittsburgh and Connelville Railroad Company's line.

The only material change which Mr. Ingraham has made, it will be noticed, is in the knob, which is identical with that proposed by Mr. Gillespie. It is composed, as usual, of vulcanized rubber, but formed in two parts by being split horizontally, and having to the upper disk (1), a metallic or other rod (2), which passes through a circular opening in the lower disk (3), and key lever (4), and is attached at its lower end to the spring (5) of brass or steel, which reaches, either in a straight line or by a curve, with its convexity upwards, to the body of the key (6), to which it is united by the anvil (7), upon which the hammer (8) plays, in the ordinary work of manipulation. Near the junction of the rod (2) and the spring (5), there is attached to (5) a small piece of platinum wire, which, by the upward tension of the spring, is kept against a similar point fixed in the key lever above it—thus at all times giving an admirable connection, similar to that of the Caton key, and very much superior to the sliding contact between brass and brass, so largely in use.

Upon taking hold of the key to commence writing, the operator will necessarily separate these points by forcing the upper disk of the knob (1) upon the lower disk (3), and as it is necessary, in order to write firmly and correctly upon any key, that the knob be held securely, the operator will be obliged to keep 1 and 3 together during the time he is manipulating, and thus secure as open a circuit as though he had flung wide the switch in the usual form of key; the instant, however, he releases the knob, the two disks are forced apart, and the circuit surely and securely closed. I have been assured by Mr. Ingraham, who has been using one of these keys for more than six months, that there is not that strain on the muscles which the idea of the spring (5) might at first lead one to expect, but that the hand at once becomes accustomed to it; and I am convinced, from my own experience with raw operators, that its use will tend very materially to improve the writing of "plugs," by securing firmer manipulation.

The invention consists, then, in the use of a double disk knob, the lower of which shall be hollow at the center and through the lever, and of a spring moving

in unison with the disk, and connecting electrically the body and lever of the key, when unacted on by a force exterior to itself. It differs from the key of Mr. Gillespie in the absence of the little levers and helical springs, which, by needlessly and dangerously complicating the apparatus, are, I am afraid, fatal to its success in practice.

I have been led into describing this invention of Mr. Ingraham's, by a desire to show that a perfectly reliable instrument, differing but slightly from the usual form, is by no means an impossibility, and because I wish to protest against the re-proposal of the long since abandoned plans now being revived. I am convinced that a key which does not depend upon its trunnions for connections is necessary, but I am also convinced that such a key as Chester's, or the Western Union, or half a dozen other styles, so long as the spring remains between the body and lever of the key, and is not removed for an abominable gutta percha band strung over one end, the very worst possible position and substance, mechanically and electrically, which the "copying" habits of our operators have given us.

I am also convinced, and I judge there are few telegraphers who disagree with me, that any key which requires a change in the present method of operating lines will fail utterly. To talk of working the long "way" and railroad wires, upon which chiefly will automatic circuit closers be used, on the European "open circuit" plan, would be ridiculous if it was not so entirely and wholly impossible. We are not, it is true, advanced a very great way in the science of telegraphy in the United States, but it is rather unlikely that we will make much advance by adopting the old clothes of our transatlantic brethren. To those who wish to read by the back stroke of the sounder, I have, of course, nothing to say.

Respectfully,

T.

## A Century Ago and Now.

To the Editor Journal of the Telegraph:

BALTIMORE, October 25, 1868.

I have before me a copy, one of the original issues, of the *Maryland Gazette* of Thursday, May 5th, 1774. Printed by Anne Chatarine Green & Son, at Annapolis, Md. The latest news paragraphs are dated: Constantinople, January 3d, 1774, 4 months old, and London, February 5th, 1774, 3 months old, under which date appears the following: "Yesterday General Gage, Commander in Chief of his Majesty's forces in North America, was at Court, and had a long conference with his Majesty. The General will soon go again in that station."

"The place lately held by Dr. Franklin, of Post Master General in America, from which his Majesty was pleased to dismiss him on Saturday last, is given to Hugh Finlay, Esq., Surveyor of the Port there."

"Sensible judicious men think his Majesty has seen the last petition that will ever be presented to him from the aggrieved subjects of North America, and that the Privy Council, to their eternal honor, have reported on the last American petition that will ever be referred to that right honorable, impartial, and unerring board."

New York, April 25th, 1774, 19 days old, appears an article touching the great tea question which was agitating this country at that time.

Compare these dates with any of your New York daily papers of the present time, and the change must appear marvelous enough.

D.

JOHN S. PARKER suggests, in an able essay on the subject of the variation of the compass, that they are caused by the revolution of the magnetic pole round the North Pole, and not, as popularly supposed, by the oscillation of the earth. This revolution of the magnetic pole is completed once in 640 years.

## Religious Services by Telegraph.

The following comes without signature or date, and may have been sent as an experiment upon us, yet might have suggested a much more foolish thing. One of our wise scientific papers suggests the idea of preaching to people at their homes by a minister from his library. Prayer is another matter, however, which needs the sympathy of human voices, and for which the wires do not seem adapted. Yet if any manipulated prayer would drive obscenity from the wires, we would be glad to have it take the place of the executive order on that subject.

To the Editor Journal of the Telegraph:

Since the wires are used on the Lord's Day for commercial and other purposes, why not use them for religious purposes?

I suggest that there be on Sabbaths "morning service" instituted on the wires. Why may not the praying telegraphers (if there is a sufficient number of them on the different circuits), appoint a particular time to be at their instruments, and offer up fraternal praise to our common Lord, by transmitting a short prayer over the wires, the same as by kneeling together in one room, or any other place? To make of the wires an altar of praise, would make the ties stronger which bind us as co-laborers.

It would have a tendency to the extirpation of obscene language from the wires, which is carried on to a great extent by some in direct violation of the rules. It could in no way do harm, but would inevitably do much good; above all, it would advance our spiritual interests and promote the glory of God. If conducted in a proper spirit, which, of course, it should be or not at all. Who approves of the above suggestion?

Seba B. Christie.

To the Editor Journal of the Telegraph:

How little thought is given to the value of a life policy by those not insured. Indeed, some who are insured look upon it as money wasted. This was strikingly exemplified in Seba B. Christie's, my brother, case, who, from the time he received his certificate in the T. M. L. I. Co. up to the commencement of his illness, which terminated in death, was thoughtful of the benefits to be derived therefrom, and frequently remarked that he was young yet, in good health, and needed no policy upon his life for some years to come. But when it became apparent to him that death was inevitable, he called for his certificate, and requested it placed under his pillow. Every day it would receive a perusal from him, and when death was nigh he exclaimed: "I am happy I joined this association." It was noticeable that he took great comfort in being the possessor of a certificate, and thanked the projectors from the bottom of his heart. How any telegrapher who has a care for the future can take this case to heart and still remain uninsured, is perplexing to solve. I hope that it may tend to enlarge our association, so that in time it may be counted by the thousands.

J. C. CHRISTIE.

A BATTERY which works for years has been invented by Herr Boettger. It retains its activity for several years, and is admirably adapted to the working of electric clocks, ringing of electric bells, &c. Each cell consists of a cylinder of thick plate zinc enclosed in a glass jar. In the centre of the cylinder is placed a bar of compact coke, and the intervening space is packed with a powder composed of a mixture of equal volumes of sulphate of magnesia and common salt, moistened with a saturated solution of these two substances. The salt mixture is moistened from time to time, and the zinc of one carefully joined to the coke of the rest, in the usual way.—*Artisan*.

## Personal.

Jack Ingle, the veteran, has been given a position in Connorsville, Ind.

Mr. H. L. Smith has quit St. Louis and accepted a position in Memphis.

Mr. Dorchester of Chicago, has taken charge of Keokuk, Iowa office.

Billy Baker has resumed his old "posish" in Cincinnati office.

William E. Tinney has accepted a position at No. 145 Broadway, N. Y.

H. Cordes has been appointed manager at Millersburg, Pa., vice W. T. Jacoby.

A. M. Smith takes charge of the office at Bergen Point, N. J., vice George M. Lana.

L. J. Blades has been appointed to the office at Harrington, Delaware, vice T. J. Herbert.

Mr. W. L. Gentry, formerly of Cincinnati, takes charge of A. & P. Co.'s office in Nashville.

Fred. Gooderich of Keokuk, has been appointed to a position in Cincinnati, vice Gentry resigned.

Albert C. Snyder, late of New Orleans, takes charge of the Logan House office, Altoona, Penn.

Miss Minnie Mixsell has been appointed manager at Princeton, N. J., vice Miss Jennie Mixsell, recently married.

Mr. Gould, formerly of Leavenworth, has been placed on the night force in Western Union Cincinnati office.

J. A. Wright, a well known New Jersey telegrapher, is filling a position with the Atlantic and Pacific Company, at Albany.

John E. Zeublin, late of Pendleton, Indiana, takes a position in the Philadelphia office of the Western Union Telegraph Company.

Ed. H. Burd, formerly manager of the United States Telegraph Company's office Trenton, N. J., has been appointed manager of the Allentown, Pa., office.

The summer office at Lake George, N. Y., having been closed for the season, the operator, W. A. Crooks, has been transferred to the Lakeville (Conn.) office.

E. S. Grove has been appointed division operator Pennsylvania R. R., Philadelphia Division, vice J. W. Crouse, who has accepted a position with the Mississippi Valley Telegraph Company.

H. A. Bogardus, of Saratoga Springs, relieved from service by a reduction of force in that office, has accepted a situation in the Western Union Company's Springfield (Mass.) office.

J. B. Nelson, late of the Cornwall (N. Y.) office, has been appointed manager of the Western Union office recently opened in the New York Central Hotel, West Albany. This does not do away with the office in Hunter's Hotel, which still remains in charge of John Morgan.

The Western Union Company have recently strung a wire from Cambridge, Washington Co., N. Y., to Greenwich, and opened an office in the latter place. The operator in charge is Fred. Belden, late of the Mountain House office. It is the intention of the Company to immediately extend this wire to Schuylerville.

The Atlantic and Pacific Company have completed a wire to Saratoga Springs, and hired an office there, but are unable to get an operator to run it this winter, terms being all the receipts, minus the expenses. They have opened an office in Cohoes, which is in charge of John Gay, recently employed on the Harlem Railroad wire.

Mr. Charles H. Bogle, an accomplished telegrapher, who has occupied a position as operator in the Western Union office in this city for the past two years, has resigned and proceeds at once to Nebraska to ac-

cept a situation with the Union Pacific R. R. Co. Mr. Alfred H. Betts, delivery clerk in the same office for several years, has made a like change. Both are intelligent, capable and zealous, and if there is such a thing as making a mark out in that crude country, they will make theirs. Success attend you, boys; the community could have better spared somebody else. —*Providence Journal*.

## McKee's Signal Box.

The inventor of this valuable addition to the conveniences of railroad service may justly blame us for neglecting attention to it when first brought to our notice, some months ago. The limited size of the JOURNAL must be apology for the omission of many things equally deserving.

The invention is one by which signal lanterns and flags are placed under the control of the operator at a telegraph station, and can be shown the instant orders are received requiring them to be used. For this purpose a signal box is erected at some appropriate place, visible to the operator from his window, in which are placed lanterns and flags, so affixed to levers and ropes, which extend by a simple arrangement to the operating room, that the whole service of signaling can be done by the operator himself, without leaving his operating table. The following statement is the best evidence of its value, and we will be glad to hear of Mr. McKee's success in introducing his signals on other roads:

Mr. WILLIAM MCKEE:—Dear Sir—Your Signal Box meets the object aimed at, viz.: the putting out and taking in signals for trains, in such a satisfactory manner that I have instructed all our telegraph stations to be equipped with them. I have seen nothing that answers the purpose so well, and I have no doubt but you will be able to get it adopted on other roads.

Yours truly, ROBERT HARRIS,  
Gen. Sup't C., B. & Q. R. R., Chicago.

I cheerfully concur in the statement made by the General Superintendent.

A. N. TOWNE,  
Asst. Sup't C., B. & Q. R. R., Chicago.

The only authentic name on the book of records from which the above is taken, and for the possession of which we are indebted to our old friend "Billie Johnston," is the following, written eight years after the above date:

LANCASTER, Feb. 17, 1854.

From the office of the New York, Philadelphia, Pittsburgh, Cincinnati and Louisville, the United States, New Orleans and Ohio and People's, St. Louis, Indiana and Lake Erie Telegraph Lines,  
Miller's Row, Lancaster, Chestnut St.,

E. A. STACY, Operator.

The title was supposed to make up for the poverty of the business. Lancaster learned the advantage of the telegraph very slowly. But she did learn, and her receipts are now \$250 per month.

Why is a baby like wheat? Ans.—Because it is first cradled, then thrashed, and finally becomes the flower of the family.

## Telegraph Base Ball.

The return game of base ball between the North Bend Club of Cleves, Ohio, and the "Night Owl Nine" of the Western Union Telegraph Office, Cincinnati, took place on the grounds of the famous Buckeye Club the morning of the 24th, resulting in the second victory for the Owls, the score at the end of the ninth inning standing 51 to 38. Subjoined are details:

## Hindoo Writing.

Writing is a curious art as practiced by the Hindoos. They may be often seen walking along their native streets writing a letter. An iron stile and a palm leaf are the implements. In writing neither chair nor table is needed, the leaf being supported on the middle finger of the left hand and kept steady with the thumb and forefinger. The right hand does not, as with us, move along the surface, but, after finishing a few words, the writer fixes the point of the iron in the last letter, and pushes the leaf from right to left, so that he may finish the line. The characters are rendered legible by besmearing the leaf with ink like fluid. A letter is generally finished on a single leaf, which is then involved in a second, whereupon is the address.

TYNDALL has lately said:—"Although we have, or think we have, tolerably clear ideas of the character of the motion of heat, our ideas are not very clear as to the precise nature of the change which this motion must undergo in order to appear as electricity—in fact, we know as yet nothing about it."

It is generally known that the lines in Great Britain undergo daily examination by the use of rheostats, or other apparatus for electrical measurement, by which the existence of defects or obstructions of the circuit are at once and easily detected and located. This is the result of the persistent skill of such men as Varley, Culley, Clark, Bright and others, who have sought to perfect the system by every possible means, and for which apparatus of a suitable kind has been prepared. Every morning, therefore, the various wires are examined by differential galvanometers, the condition of each noted and compared, and orders given accordingly.

No such careful tests have ever yet been introduced into American lines, and repairers have usually been called for only when some very disturbing cause existed, or a wire had broken. American operators can usually work a wire as long as it holds together, although some are not proof against the irritability which a bad working line occasions. This will all be changed. Already men are at work cutting out every joint and perfecting the conductivity of the wires. The batteries are also undergoing a careful overhauling to secure their maximum service. And now we have a letter from Mr. Varley, advising that several carefully constructed galvanometers, made under his own care, and of great perfection, are ready for shipment to be employed in testing the wires of the Western Union Telegraph Company. These are advance movements which we know would urge themselves into life, and which will increase the capacity of the wires and enhance their reliability.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 8,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address— JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, NOVEMBER 2, 1868.

### Can Dispatches be Refused?

A brute entered the office of the Western Union Telegraph Company, a few days ago, and offered a dispatch addressed to a lady, couched in language so profane as to raise the question of the propriety of its reception. Are we supposed to know or recognize the language of a dispatch? Must we not accept everything offered to us? Are we to be the judges of the morality of messages? Such are the questions which sometimes puzzle receivers in the performance of their duty. In the case referred to, the appeal was made to the chief executive officer, who promptly endorsed upon it as follows: "This message must be refused, no matter what the consequences may be." This was formerly, and we trust now will be the understood rule. No brute should be allowed to use the wires for the conveyance of his vulgarity, and messages of this character, essentially profane or obscene, may with safety be refused.

In the reception of messages having in view the commission of crime, the law rejects the idea of an obligation on the part of telegraph companies to receive whatever is handed to them. Thus the State law of California provides:

"If any agent or operator in any telegraph office shall knowingly send by telegraph any false or forged message, purporting to be from such officer (of the telegraph company), or any other person, or if any other person or persons shall furnish, or conspire to furnish to such agent or operator to be so sent, any such message, knowing the same to be false or forged, with the intent to deceive and injure or defraud any individual or corporation, or the public, such agent, operator or person shall be deemed guilty of a misdemeanor, and shall be punished by fine not exceeding five hundred dollars, or imprisonment not to exceed six months, or both such fine or imprisonment, in the discretion of the court."

Similar provisions exist in most of the States.

This, however, has no reference to messages of the criminal intent of which the receiver is not aware, and does not compel him to inquire into the character of the messages handed to him. But where crime is evident and known to him, the receiver exposes himself to be regarded as a participant in the crime by their reception. On this subject the recent work of Scott & Jarnigan on the law of telegraphs speaks as follows:

"A telegraph company would have the right to decline the transmission of all messages of an illegal or immoral character, or such as were in furtherance of fraud or against public policy, or where the message was for the purpose of aiding or concealing crime, or would in any other way tend to thwart the course of public justice. If this were not so, the agents of the company would, in some cases, become *particeps criminis*; and would, in all such cases, be lending their aid, for a reward, to purposes not sanctioned by law. The same moral and legal obli-

gations rest upon the company as upon individuals in reference to their contracts and dealings with each other; and whatever the law would not compel it to perform, it has the right to refuse."

Of course this right of rejection has to be used carefully and intelligently. Many messages offensive to a refined taste will be offered, which must nevertheless be accepted and sent. The good judgment of receivers, who, as a class, are men of intelligence and discrimination, will instinctively recognize that brutality of language which calls upon their interference and justifies their rejection.

### Advertising Gratis.

We have received from a friend in a western city a circular issued by the well known banking house of Henry Clews & Co., of New York, offering for sale "a limited amount of the stock of the Atlantic and Pacific Telegraph Company." The circular states concerning this stock: "The subscription price is forty dollars per share, and the nominal capital of the company is but five millions, while the Western Union has forty millions." But it omits to state, however, what is nevertheless true, that the Atlantic and Pacific Company's capital of five millions has all been contracted in payment for three thousand miles of two wire line, being at the rate of \$1,666.66 in stock for each mile of line. Now, as the Western Union Company has about sixty thousand miles of pole line, averaging nearly two wires, its capital stock on the basis of the Atlantic and Pacific Company should not be forty millions, but over *ninety millions*! or, with its present volume of stock, the market value should be more than double the present quotations. So that if Atlantic and Pacific Company stock is cheap at forty dollars per share, Western Union is cheaper at eighty.

It cannot be that Messrs. Clews & Co. understand the facts concerning the enterprise to which they are lending an honorable name and reputation, for a commission upon possible sales of a stock which, if held as an investment, will never yield a dollar either of interest or principal. We believe the stock advertised to be that which the contractors for building the line have been unable to dispose of by personal solicitation, and that they are now attempting to palm it off upon the credulous with the *quasi* endorsement of an eminent house. We predict, however, that the time will soon come, if it has not already arrived, when it will be found exceedingly difficult to induce the public to invest their savings in the shares of sham corporations, whether oil, mining, or telegraph, the purpose of whose organization is, not to conduct an honest business, but to put money in the pockets of rings of reckless speculators, who have too frequently been able to hide their purposes behind a formidable array of respectable names.

### Magnetic Heat.

If a magnet, with poles pointing upwards, be rotated rapidly on a vertical axis below a small copper plate, on which a glass flask is placed, the air contained in the flask will be heated, and its expansion may be made visible. The water in a copper vessel, if similarly placed, will become hot in proportion to the rapidity of the magnetic revolution.

From experiments on the electrolytic powers of the currents of the magneto-electric machine of the Atlantic Company, it seems that when the current sent by the commutator is always in the same direction, the electrolyte power is that of 144 Daniel elements with sulphate of copper; while, when the current is alternated, as in the production of the electric light, the electro motive power is nil.

A CRAZY negro recently broke all the glass cups on the telegraph poles for two miles between the towns of Louisiana and Frankfort, Mo.

## OFFICIAL STATEMENT.

Western Union Telegraph Company.

SEPTEMBER, 1868.

Gross receipts,	- - -	\$630,665 36
Current expenses,	- - -	372,197 50

Net profit,	- - -	\$258,467 86
-------------	-------	--------------

An increase of \$32,560.57 over the corresponding month of 1867, and a decrease of expenses amounting to \$3,344.00.

The Morse System in Europe—The Hughes Modification.

Notwithstanding that England, through some of her writers, claims to have "given the telegraph to the world," and it is also claimed by her that even *America* received the invention from England, it is every where else, both on the continent of Europe and in America, acknowledged that *the world is indebted to America* for the modern telegraph.

The system known and established every where as the Morse system, is the *first* realization of a true telegraph. It was lately remarked by one of the German directors of the telegraph in Prussia, that "it was a marvellous fact that with all the attempts at improvement upon the original Morse invention, nothing as yet had been contrived that can be advantageously substituted for it." To use his expression, "the cry comes up from all quarters, send us the Morse."

Speed of transmission (that is, an increase in the quantity of matter that can be transmitted in a given time) is just now occupying the attention of the skillful everywhere. The modifications of the Recording Telegraph, for increasing this speed, are more skillful mechanical constructions of the *original automatic process of Morse*, and very ingenious but necessarily complicated modes of *recording*, by printing the ordinary Roman letter. The most popular and efficient of these latter modes, is the beautiful printing apparatus of Hughes. It has been employed with advantage in various places in Europe.

It appears, however, from a letter we have seen recently forwarded from Paris, that the inherent difficulties, which an experience of some years has shown in the practical working of the Hughes apparatus, are becoming fatal to its extensive use. The writer, a distinguished savant, says, under date of Paris, 14th of September:

"There is nothing new in telegraphy, unless it be that Mr. Hughes is entirely remodeling his apparatus, under the hope of making it better, the result of which is very problematical; he determined upon this because of the ill-working of some instruments made by M. Siemens of Prussia, and by Messrs. Dumoulin and Hardy of Paris, without being aware that those constructed by Messrs. Digney freres, did not present the same inconveniences. Without any doubt, his apparatus presents very grave difficulties, which cannot be surmounted, or, rather, be diminished, but by a great improvement in the construction. But it appears that the changes which he proposes will only increase the difficulty of construction.

"You perceive that the *Morse system* is not likely to be *dethroned*." As proof of this, wherever there is a *Hughes*, there is also a *Morse* at its side, to relieve it."

In saying the Morse system is *not likely to be dethroned*, the writer, doubtless, has reference to the expression of M. Gavaret, who, in an elaborate article on the Telegraph, had stated that the Morse system had hitherto occupied the telegraphic throne as king, but was likely to be dethroned by these modern improvements.

THE female telegraph operators in England have been alarmed by a report that the government proposed to dismiss them all when it got control of the lines, but the story is contradicted.

**Authorship of the Practical Electric Telegraph of Great Britain.** By the Rev. Thomas Fothergill Cooke, M. A.

This is a work written by Rev. Thomas Fothergill Cooke, to prove that his brother, Mr. William Fothergill Cooke, and not Professor Wheatstone, was the author of the practical electric telegraph. The claims of Mr. Cooke are set forth with force and bitterness. We would be glad to see every great pioneer of civilization receive his due, but this will not be hastened by passionate statements, and a severity of language which suggests partiality.

#### Don't Bear on so Hard!

NEW YORK, Oct. 16th, 1868.

To the Editor Journal of the Telegraph:

Reading the pie story in the last number of the JOURNAL, reminded me of another telegraphic joke which transpired some years since:

The usual hour for sending reports to Boston and way stations had arrived, and New York had raised all the offices except New Haven. The operator at that office was not yet back from tea. After calling for some time, the clerk in the office, who was somewhat of an operator, resolved to answer him, and let the paper run so it might be copied, when the operator returned. He accordingly told New York to "go ahead." New York had, however, sent but one or two words, when New Haven broke and requested him to "repeat."

New York started again, but had not sent more than half a dozen words before he again broke, saying, "Repeat! Repeat!" By this time the operator at New York had got impatient, and angrily demanded to know what the matter was, to which he replied, "Repeat! Repeat! and don't bear on so hard, you make holes in my paper." Just then the operator returned.

C. F. L.

**Bliss, Tillotson & Co., No. 171 South Clark St., Chicago.**

It will be noticed that this house, so recently established in the central city of the West, has already been obliged to change its quarters to more extensive premises on the same street, to enable them to attend with suitable convenience to an increasing business. Twenty years ago we could not prevail on the old firm of Clark & Son, Philadelphia, to make half a dozen instruments in advance, so as to be ready for orders, fearful that so many would never be needed. Now, at ever increasing manufactories they are made by the score. We are glad to see these evidences of prosperity on the part of men who have earned their popularity by enterprise, skill and promptitude, and which has rendered the New York house which it represents strong and successful.

We notice that the house of L. G. Tillotson & Co., New York, has in its partnership two active and competent gentlemen—E. S. Greeley and G. B. Gavett, Jr., both of whom are thoroughly up to the times, and give increased vigor to its operations.

Hiram Sibley, Esq., left for Europe Saturday, October 31, designing to spend November in Paris, December in Florence, and the remainder of the winter and spring in Rome.

We shook hands Friday last with Cyrus W. Field, Esq., who has returned from Europe fresh and hearty, and does not look at all as if he designed "retiring to a farm."

ONE of the simplest modes of automatic telegraph writing was proposed by Professor Morse during the lifetime of the late Alfred Vail, which was simply the use of the indented paper of the Morse Register used to elevate a lever as the letters passed beneath it. A description of it appears in one of Mr. Morse's papers, and might easily and inexpensively be brought into use.

**Chester Partrick & Co., 38 South Fourth Street, Philadelphia.**

There is nothing so surprising or so gratifying to us as the growth of the various establishments for the manufacture of telegraphic machinery and purposes related thereto. In Boston, in Chicago, in New York and in Philadelphia, premises deemed ample a year ago are found too limited, and so enlargement or removal has become a necessity. We had occasion to refer in our last to the removal of Chester, Partrick & Co. from their old premises in Philadelphia to new and eligible quarters. Their advertisement shows the extensive scope which their business has taken, and we have occasion to know that in a direction quite unanticipated by them, in the use and manufacture of nitro glycerine, and in the appliances connected therewith, this young and active firm are building up a strong and influential name. So be it. We commend them to all who read the JOURNAL, as careful, skillful, honorable men, who will execute well everything entrusted to them. See advertisement on page 7.

#### To the Public.

We would express to our many friends and patrons our heartfelt thanks for their kind support and patronage during the first year of our business existence.

To this, and to their patience with our many shortcomings, we owe a success beyond our most sanguine hopes, and which has so greatly increased our facilities and resources that we are enabled to enter upon a new year, with the certainty of giving increased satisfaction to our present friends, and of largely increasing the circle of our patrons.

We respectfully call the attention of all to our recent advertisement.

CHESTER, PATRICK & CO.,  
38 South Fourth Street, Philadelphia.

DAVID BROOKS, Esq.:

DEAR SIR—Your insulators used for one hundred miles along the Schuylkill river, I am pleased to say, give the most perfect results. On the 14th and 15th the weather was calculated to give them a severe test, but we found no perceptible difference in working the line. This was the case not only without additional battery, but with a set of small sized Daniels, that were working for a fortnight previous without renewal.

I hope shortly to be able to give you precise calculations of the capacity of the line electrically.

I am, dear sir, yours truly,

ARTHUR POTTER,

Supt. Tel. S. N. Co.

Philadelphia 17th October, 1868.

REQUESTS have frequently been made for full sets of the JOURNAL. The editions of numbers 2 and 3 having run out, we have been unable to meet them. These, however, will soon be reprinted, and broken sets can be made complete.

SEVERAL disastrous fires of recent occurrence in Troy, N. Y., has been the means of awakening the inhabitants of that city to feel pretty keenly the need of a Fire Alarm Telegraph, and quite a fight is now going on in the Common Council in regard to it, some members of that body still being strangely bent on opposition to this important means of protection from fire.

"PAPA, why don't they give the telegraph wires a dose of gin?"

"Why, my child."

"Cause the papers say they are out of order, and mamma always takes gin when she is out of order!"

A number of articles, including one respecting the Brooks insulators, respecting which we have received so many testimonials of their excellence, another of which will be found elsewhere, have been crowded out.

A MEXICAN, by name of Francisco Estrada, Jr., claims to have solved the problem of perpetual motion. His machine produces electricity, which causes motion, and the motion in turn generates electricity.

## TARIFF BUREAU.

### Semi-Monthly Circular.

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
November 2, 1868.

To all Offices on W. U. Lines—

The following changes have occurred since Oct. 15, the date of the last Tariff Order. Please note them in your Tariff Book:

#### NEW OFFICES.

Bingham, Me., tariff 15 and 1 more than Skowhegan, Me.  
Barnesville, Ga., tariff same as Griffin, Ga.  
Bryan, Wyoming Territory, tariff same as Green River, W. T.  
Butler, Ga., tariff same as Ft. Valley, Ga.  
Camden, Ark., tariff 8.00 from Louisville, 4.00 from Washington.  
Carrollton, Mo., tariff 5c. more than Brunswick, Mo.  
Cuba, Ill., tariff same as Lewiston, Ill.  
Eldorado, Ark., tariff same as Meriden, La.  
Farmersville, La., tariff same as Vienna, La.  
Glascow, Ill., tariff same as Canton, Ill.  
Kirksville, Mo., tariff 5c. more than Macon, Mo.  
Milford, O., tariff same as Loveland, O.  
Miami, Mo., tariff same as Brunswick, Mo.  
Murray, Orleans Co., N. Y., tariff same as Brockport, N. Y.  
New Haven, Ky., tariff 60 from Louisville, 2.25 from Washington.  
Oxford, Ala., tariff same as Blue Mountain, Ala.  
Sanford, Ind., tariff same as Terre Haute, Ind.  
Selma, N. C., tariff same as Raleigh, N. C.  
Solon, Me., tariff 15 and 1 more than Skowhegan, Me.  
Timmonsville, S. C., tariff same as Florence, S. C.  
Washington Sta., Sandusky Co., O., tariff same as Elmore, O.

#### OFFICES OPENED ON OTHER LINES.

Locust Point, Baltimore, Md., tariff 15 and 1 from Camden Station, Md. Check Camden Station.

#### OFFICES CLOSED.

Sharon Springs, N. Y., for the season, and South Shaftsbury, Vt.

#### GENERAL INFORMATION.

Hereafter business for the following named offices on the Catawissa R. R. will be treated as "other line" offices, and checked to Danville, Pa., at the rates here given:

Catawissa, Pa., 35 and 2 from Danville, Pa.

McAuley, Pa., 45 and 3 " "

Ringtown, Pa., 45 and 3 " "

Summit, Pa., 45 and 3 " "

The following will also be treated as "other line" offices, but checked to Mauch Chunk, Pa.

Centralia, Pa., 50 and 4 from Mauch Chunk, Pa.

Delano, Pa., 50 and 4 from Mauch Chunk, Pa.

Hazleton, Pa., 50 and 4 from Mauch Chunk, Pa.

Mount Carmel, Pa., 50 and 4 from Mauch Chunk, Pa.

Penn Haven, Pa., 50 and 4 from Mauch Chunk, Pa.

Quakake Junction, Pa., 50 and 4 from Mauch Chunk, Pa.

Weatherly, Pa., 50 and 4 from Mauch Chunk, Pa.

All offices North and East of Louisville having "special sheet A," will add one dollar to their Louisville rate to obtain tariff to Memphis, Tenn.

To Offices in Eastern Division having "Special Sheet A":

Offices in New York State, west of and including Rochester, will collect to Chicago, Ill., 135 and 9; to Milwaukee, 150 and 10. Offices between Rochester and Syracuse, including Syracuse, will collect to Chicago 150 and 10; to Milwaukee 165 and 11. Offices between Syracuse and Albany, including Albany, will collect to Chicago 160 and 11; to Milwaukee, 175 and 12. Offices between Albany and New York City will collect to Chicago 175 and 12; to Milwaukee 190 and 13.

The rates to Chicago will go into effect immediately. Rates to Milwaukee on the 5th November.

Offices in Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecticut, having "Special Sheet A," will add to their "special rate" to Albany and New York the following rates: From Albany for Chicago, 160 and 11; for Milwaukee, 175 and 12. From New York for Chicago, 175 and 12; for Milwaukee, 190 and 13, and adopt as their rate to Chicago and Milwaukee, whichever shall prove to be the lower. To go into effect November 5th.

Messages for South Hadley and South Hadley Falls, Mass., will be delivered from Holyoke, Mass. Charges for the first 1.75, for the last 25. Check Holyoke.

Gasport Depot, N. Y., in JOURNAL of October 15th, should read Gasport Depot; Charles City, Minn., should read Charles City, Iowa; and Ononwa, Iowa, tariff same as West Liberty instead of Liberty, Iowa. Tariff to La Plata, Mo., in JOURNAL of October 1st, should be same as Macon, Mo.

WILLIAM ORTON,  
President.

#### MARRIED.

On the 14th of October, by the Rev. A. J. Frost, at the First Baptist Church, Syracuse, Ed. H. Thresher, of the Western Union Company's Rochester office, to Miss A. Florence Ingersoll, of the former place.

**The Declining Year.**

The year begins to tremble with decay,  
Like an old man who leans upon a staff,  
And in the graveyard reads the epitaph  
Of all his offspring who have passed away;  
But yet soft breezes with his thin locks play,  
Scattering his sadness with a jocund laugh,  
While the great sun yet warms in his behalf,  
And with his darts keeps Winter still at bay.  
Yea, soothed and flattered in full many ways,  
Though all the fields be bare, and woodlands sere,  
Half-hidden from his sight by thickening haze,  
Serenely smiles the slow-declining Year,  
Like one who has in goodness spent his days,  
And waits his coming end without a fear.

W. L. S.

**The Law of Telegraphs, By William L. Scott and Milton P. Jarnagin, Memphis, Tenn.**

Messrs. BARKER, VORHIS & Co., *Law Booksellers*, 66 Nassau street, N. Y., have sent us this important work, treating on a subject which has already excited much careful examination, and which must elicit still more, before the status of law in regard to this peculiar field for its application is determined. As a digest of existing telegraph law and judicial decisions alone, the work is a desirable and timely addition to the libraries of the legal profession and telegraph companies. The elaboration of the law of the telegraph by the talented gentlemen who have prepared this volume, and the opinions expressed therein will, of necessity, challenge review and felicit criticism, which, in turn, will aid in the discovery of the true basis on which telegraph companies must stand before the public. At present we decline to say more than advert to the volume before us as highly useful and timely. As a work of typographic excellence it is superior to any similar volume in our possession, and bears the imprint of John Wilson & Son, Cambridge, Mass.

GOULD & LINCOLN, of Boston, have sent us the Annual of Scientific Discovery for 1888. This valuable compend has been published for the last twenty years, and edited with so much taste and discrimination as to render it popular and indispensable. It is the history of scientific development in so easy compass as to make it a hand-book of all which, for general purposes, it is important to record. We have read it with great pleasure, and it has given us a wider knowledge of the busy age in which we live, and the busy brains around us. We would be glad to see it in the hands of all our intelligent operators. The present volume is edited by Samuel Kneeland, A. M., M. D., Secretary of the Massachusetts Institute of Technology, and is carefully and felicitously arranged.

If marriages are a sign of prosperity, the country is in good condition, and the frequency of cards on our desk, knotted together with the sweetest of ribbons, and with initials intertwined into the loveliest of monograms, proves how many happy people there are in these rich autumnal days. We acknowledge receipt of the elegant cards of Mr. and Mrs. Ten Eyck H. Fonda, of Fonda, N. Y., and of Mr. and Mrs. Benj. Dexter, whose marriage appeared in our last, and to both of whom we extend our kindest congratulations.

The noble Faraday said: "There was a time when I thought I knew something about the matter; but the longer I live, and the more carefully I study the subject, the more convinced I am of my total ignorance of the nature of electricity." There is something painful in these words.

ALEXANDRIA, Va., Oct. 28, 1888.

To the Editor Journal of the Telegraph.

To determine on what day of the week my receipts are the largest, I have recently made a calculation of the past year. The result is, that in seven months I did the most business on Monday. During the remaining five months, Wednesday, Thursday and Saturday were the heaviest.

If others will make such a calculation, the question might be definitely settled.

**A Magician's Residence.**

Electricity is a wizard's power. With it, and a little mechanical skill, a man may turn his house into a magician's castle. The late ingenious Mr. Appold—of centrifugal pump notoriety—indeed, did this without it. His doors opened as you approached them, and shut behind you; his stable gates did the same; upon touching a spring the window shutters closed and the gas was turned on; his apartments maintained themselves at a uniform temperature, and at a proper hygrometric state, by regulating thermometers and atmospheric damping apparatus; in short, his house was full of surprising devices, created and worked out by his wonderful inventive and executive skill. Had he pressed the subtle fluid into his service there is no saying into what a palace of enchantment his dwelling would have been transformed. But what he did not do has been done by the famous Robert Houdin, who has made electricity do the work of a retinue of servants and a watchman to boot. The ex-conjuror lives at a country seat called the Priory, near to his native town of Blois, and there it is that these wonderful applications have been effected. A visitor presenting himself at the portal finds the name of "Robert Houdin" upon a door-plate, above which is a little knocker; operating upon the latter a great bell sounds within the house. In a few moments the lock is thrown back, and the name on the plate changes, like a pantomime trick, to "Entrez." The visitor obeys, and the door automatically closes behind him. If more than one person enters, the invisible and inanimate "con-cierge" makes known the fact by tinkling a small bell, which keeps up its tintinnabulum so long as the door is held open. The carriage-gates, some distance off, announce themselves open or shut in the hall, where an inscription exhibits the words, "The gates are open," or "The gates are shut," as the case may be. The letter-box on the gate tells us in the house how many letters have been put into it, and, by an argument with the postman, which are letters and which book-parcels or newspapers; and if the postman is wanted at the house to carry correspondence to the village, he is apprised of the fact by a bell, of the ringing of which he knows the meaning. The horse, in a stable more than forty yards from the house, is fed at regular intervals by electrical intervention. At stated times a clock sends a current, which opens the orifice of a shoot or hopper, and allows the due proportion of provender to fall into the manger. This same clock is charged with the transmission of time to two large external dials, and to several smaller ones about the domicile, all of which go together in sympathy, so that Father Time has here a company of subalterns that march step by step, with irrefragable order. Then it rings bells at the proper times for meals and other regular household duties, calls up the servants by alarms in the morning, and at night puts a galvanic current in connection with a wire that communicates with all the doors and windows, so that if any of these are attempted by burglars an alarm is instantly given. Lastly, the green-house telegraphs its temperature to the conjuror's study. If the gardener allows the thermometer to rise above or fall below certain limits, his master is apprised of the irregularity, and he is called to account next morning. The poor man knows when he has been at fault, but does not know who or what tells the tale, and he thinks he has a sorcerer to serve; and so, in the only sense in which we can now-a-days regard the word, he has.

A new Russian invention is a letter-box, so contrived that when a letter is deposited, it gives the depositor a ticket in exchange, showing the date when the letter was put in the box. We are not informed whether the government is expected to assume any responsibility not already assumed in regard to the safe delivery of letters. If not, what is the invention worth?

**AMERICAN COMPOUND TELEGRAPH WIRE.**

SUPERIOR CONDUCTIVITY,  
LIGHTNESS AND DURABILITY.

A MOST IMPORTANT INVENTION.

We would call the attention of Officers of Telegraph Companies, Telegraph Builders and Contractors, and the Public, to the new

**PATENT COMPOUND TELEGRAPH LINE WIRE.**

Manufactured by the

**AMERICAN COMPOUND TELEGRAPH WIRE COMPANY,  
OF NEW YORK.**

This Wire has already been put up on sections of several Telegraph Lines, and its merits fully tested, and the results show that it combines all the good qualities which are claimed for it, viz., *Economy, Superior Conductivity, and Increased Strength, with Decreased Weight of Metal.*

In its composition are used three metals, either of which is a good conductor, Steel, Copper and Tin; and the superiority of Copper as a conductor over other metals is well known, and but for its ductility rendering its permanent suspension in a pure state intact impracticable, it would have always been used exclusively as a Conductor on Telegraph Lines. By combining it with Steel the desired strength and permanence is attained, and the necessary weight of the line wires reduced two-thirds, thus obviating the necessity for using a large number of poles to the mile, and by reducing the points of contact, lessening the chances for trouble and escape of the electric fluid.

All other Line Wires must inevitably be superseded by this, and such Telegraph Companies as now adopt it will the sooner realize the advantages to be derived from its use over those whose lines are of the old rotten and rusty iron wire pattern.

Respectfully announce that they have increased their facilities for the prompt execution of all orders with which they may be intrusted, whether for the construction of any or all lines of telegraph, or for the supply of apparatus or material.

Among other recent improvements, for which they have secured the sole or part agency, attention is called to the following novelties:

1.—Patent anti-trunion Key with eccentric circuit closer.

2.—Patent Self-closing anti-trunion Key.

3.—Kerite or (horn covered) copper or compound wire or cables.

4.—Covered compound out door line wire.

5.—Blasting apparatus, cartridges, batteries, &c., &c.

6.—Calcium lighting apparatus.

7.—Medical and test batteries, direct and induced currents.

8.—Apparatus for electrical measurement.

9.—Electric gongs of any desired size or weight; alarm apparatus, &c., &c.

10.—Electrical clock work and experimental apparatus of every kind.

The success of the past year and increased resources warrant the promise of dispatch in the execution of all orders, upon terms satisfactory to our customers.

IMPROVED TELEGRAPH INSTRUMENTS.

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed. His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them. Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionally stronger magnet, while the resistance will be the same.

**PRICES.**

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	18 00
Main Sounders, same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Cover Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package. He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers' prices.

PATENT PARAFFINE INSULATOR WORKS.

No. 22 SOUTH TWENTY-FIRST STREET.

PHILADELPHIA.

All varieties of INSULATORS manufactured at these Works are warranted to excel the usual style of Glass and Rubber more than one hundred fold. In view of the error and delay in transmission, waste and consumption of battery material, the results of defective insulation, its fragile nature and expense of renewal, nothing is more manifest than its economy.

To RAILROAD COMPANIES relying upon the efficiency of their telegraph departments it is of great value.

# JOURNAL OF THE TELEGRAPH.

NO. 25.

NEW YORK, NOVEMBER 16, 1868.

VOL. I.

## THE DANISH TELEGRAPHS.

A telegraphic dispatch sent from Copenhagen last month concludes thus: "The laying of the Anglo-Danish marine cable is commenced. We hope that the electric communication between Denmark and England will be established in a few days."

We believe this to be an opportune movement to unite the telegraphic organization in the Danish Kingdom.

This country now contains 4,025 kilometres, 2,515 miles of wire, and 89 telegraphic stations open to the public. The Morse apparatus is the only one employed. Of these 89 stations, 53 belong to the government, 21 to private telegraph companies, and 15 to railroads, and they are at this moment considering the propriety of giving into the hands of the government the lines and offices belonging to the companies.

The tariff is fixed at 90 centimes for a local telegram of 20 words between any points in the kingdom. In 1867 there were transmitted 306,150 telegrams, of which 174,560 were local and 133,590 foreign. All the stations send written dispatches in all languages, even in cypher, the only conditions being legible writing in an alphabet transmissible by the Morse apparatus.

Money orders to the amount of 50 rik dollars, or 137f. 50c., can be paid at all post offices by means of the telegraph. The sum being deposited at the original office, an official telegram is sent to the place designated, ordering payment.

For this service the sender has only to pay the tariff on the official telegram.

Messages can be sent from points where there are no telegraphic stations, by sending them by post or by any other mode of transportation to the nearest telegraph station. These telegrams can be paid by a postage stamp affixed to a designated part of the form. These forms are the same as the printed envelope, and can be procured at all post and telegraph offices. At the top of these forms is printed an extract from the rules for the transmission of dispatches. The stamps are detached from the forms and sent to the Department of Finances at the same time that the other reports are forwarded. It is proposed to extend these privileges to the private and railroad telegraph stations.

Meteorological observations are sent and bulletined each day at the principal posts of the country.

The telegraphic communication between Jutland and Copenhagen is sustained by three cables containing altogether ten conductors each, connected with special air lines. A new cable containing seven conductors will be laid in the Grand Belt next year. Direct communication with Stockholm, Gothenbourg and other places in Sweden is assured by means of a strong cable with four conductors across the Sound. With Christiana and other cities of Norway, communication is held through Sweden, and also by means of a cable which goes through Arendal, crossing the Skagerack. These two cables are

in communication with the special air lines constructed in the three countries for the exclusive object of transmitting international telegrams.

From 1863 to 1867 the telegraphic intercourse between the Scandinavian countries has increased each year 25 per cent.

### The Nonpareil Self-adjusting Relay.

CHARLES DURANT, INVENTOR, NEW YORK.

This is an invention which, at first sight, seems ill-adapted to its design, but, like many people we know, improves by acquaintance. Several magnets prepared by Mr. Durant, the workmanship on all of which is of a superior kind, have been in use by experienced operators, all of whom think highly of their capacity as self-adjusters, and have been gratified with the facility with which they accommodate themselves to their altering circumstances, an accom-

Fig 1

plishment which it is very hard for most people to learn.

The illustrations are so clear and minute that much description is unnecessary. A is a box inclosing helices of the usual size. B is the armature, so placed that its lower edge touches the corresponding edge of the core of the magnet C. The upper edge of the armature is clear, thus causing the lower edge to act as a fulcrum. D is the head of the armature lever having in it a

Fig 2

the action of an adjusting lever placed across the face of the magnet box, by the depression of which the action of the spring is increased, the lever being attached to the spring by a connecting piece of fine wire or silk, f f. H H are springs on which the

magnet rests, and are designed to prevent the jar of the instrument table affecting the action of the magnet. L L are the usual local connections. M M are the main circuit connections. S is an adjusting screw to determine the play of the movable bar in the head of the armature lever, to which s acts as a binding screw.

It will be seen that the peculiarities of this magnet are three:

1. The axle below the armature is made so delicate as to serve the purpose of a spring, yielding as the magnet draws over the armature to its surface.
2. The armature rests on the core of the magnet at its lower edge, receiving motion only by being drawn over at its upper edge, which is free.
3. The movable bar at the head of the lever of the armature.

The head is adjusted by the screw S to a position when the armature may be said to be at rest, and the usual play is allowed which is given to relays in ordinary. The movable bar will so remain until a stronger current draws the armature to a more vertical position or nearer the cores, when the bar slips correspondingly, and is at once adjusted to the altered condition of the magnetism, the space allowed for play remaining as before.

The spring F is adjusted to prevent too great sensitiveness to slight currents generated in the earth, or coming from other wires, as also to prevent too great ease of motion, by which sufficient firmness of stroke would be prevented.

Objections will occur to many minds as they did to us in looking at this magnet, particularly the seeming rigidity of motion by the fixed condition of the lower edge of the armature in connection with the lower axle, and the absence of it in the self-adjusting bar. We can only say that the working of the magnet is very satisfactory and has been used for days without adjustment. The workmanship on these magnets is most excellent, the parts made with great accuracy, and made to a fixed size and form, so that the parts of one machine can be used on any other. Mr. Durant is now engaged in adapting a magnet to the rapid movements of the printing instrument, which he hopes to render increasingly responsive. The certificates of Messrs. Brown and Downer ought to be regarded as ample guarantee of the merits of this welcome invention. We refer all interested to Mr. Durant's advertisement on another page.

### Mediterranean Cable.

A letter dated Alexandria, October 14, from the Hon. Charles Hale, our worthy Consul General in Alexandria, Egypt, advises Prof. Morse of the completion of the Mediterranean cable. He says:

"The newspapers no doubt have acquainted you with the fact that the new cable has been successfully laid in the Mediterranean which very much improves our telegraphic communication with Europe and America. It is necessary to use two words in dispatches coming that way, besides the rest of the address, to wit: 'VIA MALTA.'"

CHARLES HALE.

## Correspondence.

## The Agency of Electricity in Storms.

To the Editor Journal of the Telegraph:

SIR—The article on Meteorology in the JOURNAL of the 15th instant propagates such a remarkable theory of the cause of storms and earth movements, as at once to subject its author to criticism, which, indeed, I suppose he is quite ready to meet.

What he is pleased to call a "few axioms" are so un-axiomatic as to cause wonder at such a designation. The first of them, that "electricity is an *imponderable body*," is not only not an axiom, but it is not, at least so far as we can judge in such matters, any sort of truth whatever. Another second assertion, that "when excited or created, it separates into two distinct bodies or states, called negative and positive electricity," is as far from the generally accepted ideas as the first. Electricity is not a *body* or a *substance*, or any kind of *matter* whatever, but is an "affection of matter, or mode of force;" imponderable necessarily for having no mass, it cannot gravitate towards larger masses of matter. This being true, the third assertion, that "during their separation (of the negative and positive bodies or states) they have a powerful affinity for each other, and the attraction between their *bodies* is very strong," is, of course, groundless. The assertion that "all nature is divided into conductors and non-conductors," while false in itself, is relatively true, as the expressions are commonly used, but that when a "conductor" is placed between two receptacles, having in each a quantity of electricity, the "negative and positive electricity will instantly unite with a shock greater or less in proportion to the volume and conducting power of the medium of re-union," in other words, and Mr. Donnelly, as a civil engineer, should be more explicit, as the product of the mass (volume) and the square of the velocity, is a little bit too much to be taken as a whole. The absence of matter, or mass, or volume, or any ponderable quality, effectually prohibits, one would think, the possibility of collision. And then we learn that "no electricity can be produced without the presence of water," and that "water is always present at the re-union," i. e., at the "shock." "Water," too, "is a conductor of electricity, except in a state below 18°," when it becomes electric," as may be seen in any manual of philosophy in any "seminary" in the land. Air, not being a conductor at any temperature, suddenly becomes one, when it gets a little water, and increases its conductivity as it approaches saturation, which occurs "when it holds about two per cent, and it cannot hold any more," though it does, and some meteorologists hold that the temperature of the air, advancing in an arithmetical series, its capacity for moisture is accelerated in a geometrical series, and what is damaging to Mr. Donnelly's series is, that they have proved it too. To be exact: at 86° Fah. the air will hold a fortieth part, or 2½ per cent., of its weight of aqueous vapor, and at 118° Fah. 5 per cent., and so on. That "the lower stratum of the atmosphere is always the driest, and it increases in humidity as we ascend," will be news indeed to the inhabitants of the damp and fever-stricken prairies of the West, and cause some little astonishment to those who, like the father of the illustrious Norval, feed their herds on the Grampian Hills; and even I, who, having lived down near the sea level in Philadelphia, somehow find it dryer up here, on the highest table land in Pennsylvania, 1,500 feet in the air. And to the very last of the "axioms," that "a vapor cloud that will remain suspended in the atmosphere cannot be formed by artificial means," I am compelled to say that while I cannot see what possible connection this has with the subject, I am yet convinced that Mr. Donnelly is mistaken.

These are all the "axioms," commencing with a materialistic theory that has been dead so long as to be quite new in its rejuvenation. We are given to understand that the collision of the particles of something which can have no particles is attended with a "shock," which is proportional to the volume of that which can have no volume, as we are expressly assured the something is imponderable; and then the marvelous absurdity "of these separate bodies of electricity, remaining attached close on either side of it (the non-conductor), although the fluid is unable to pass through!"

I had intended to say nothing about the "key to the secret cabinet of meteorology," yet I cannot help noticing some of the "fine writing" of the article, and that is when writing of the "circuit wires" of the great Leyden jar arrangement he makes—he says "but some feature, as mountains, are nearly always in connection, and their conductors go on accumulating heat from year to year until the last particle fires the train. Fusion commences, with fusion motion, when, instantly, the whole latent power of heat is called into activity, and fuses every substance that comes within its reach!"

To my mind such a statement is simply absurd.

Let us look at this "theory" of Mr. Donnelly's. In the first place, to get rid of the "stupid theories" of geologists, he abolishes a fluid "earth, and sets up a fluid electricity, which is somehow created out of nothing" in each revolution of the earth. Having arranged the humidity of the atmosphere to suit his theory, he cruelly casts from the clouds a large quantity ("volume") of the "fluid," which, curiously enough, makes no obligation until it is bottled up, as it were, in the bowels of the earth, when, like its prototype Vulcan, it sets to hammering furiously, "nursing its wrath to keep it warm," and the "whole latent power of heat" being called in to take a hand, there is the very deuce to pay on the surface.

For this wonderful fluid is not only expansive, but when heated where, from want of room, it cannot be as big as it would like, it "will hold heat enough to dissipate into a gas without changing state," just as some of our operator friends become "gasey" when they "dissipate." This is the only time that Mr. Donnelly attempts a quotation, except when he quotes Dana from memory, and having myself a great respect for that distinguished mineralogist, I hope his (Mr. Donnelly's) memory is as poor as his "axioms," and it serves all the more strongly to show how completely he has mistaken the nature of electricity, and its actions in meteorological phenomena.

If I could discover the least particle of truth in any of his assertions, I should feel inclined to ask Mr. Donnelly's pardon for having treated him so cavalierly, but the very best I can bring myself to in the present circumstances, is to advise him most respectfully to procure Noad's "Students' Text Book," or the same physicist's "Manual of Electricity," and if, after a little reading, he does not abandon his theory, "axioms" and all, your most obedient servant is no

CIVIL ENGINEER.

OCTOBER 27, 1868.

## Electrical Frames.

A tinsmith in Reno, California, during a recent thunder storm noticed that a lad in his employ seemed to be afraid of his tools. Upon questioning the boy, he complained that something strange was the matter with them. The tinsmith, upon attempting to take up the large scissors which the youngster had dropped, received a shock that nearly prostrated him. Immediately after, little balls of fire began hopping about over bits of iron, and making finally a united assault upon the coal furnace, whereupon the "boss" and his apprentice wisely and speedily vacated the premises until the subsidence of the storm.

## The French Cable.

We are permitted to publish the following:

W. OXON, Esq.,

President of the W. U. Tel. Co.

MY DEAR SIR—The French cable is progressing rapidly.

The Great Eastern is in the Medway receiving the three tanks to hold the cable.

The centre or main tank will have to be increased in diameter nearly 15 feet to enable the ship to carry the cable, and even then it will be necessary to employ another vessel to lay the shore ends and shallow water portions.

The copper conductor weighs 400 lbs. to the knot—the present Atlantic cables weigh only 300 lbs.

The iron wire, or rather soft steel wire, known as homogeneous metal, used for the exterior sheath, is galvanized and surrounded with five Manilla yarns prior to being spun into cable.

Very great precautions are being taken to guard against brittle wire, and at the same time to secure the necessary strength.

The conducting power of the copper, and the insulating power of the gutta percha, are considerably greater than in the present Atlantic cables, and the cable is in every way of excellent quality.

The shore ends will be as massive as any yet constructed, and analogous to those of the 1865 cable, in which an invention of mine (now patented) is used to secure flexibility, so that the anchors shall not break it, and to avoid the consequent stripping when an anchor undercuts the cable and comes to a broken wire, which it will often strip out for one or two hundred yards. The exterior wires consist each of a strand of three wires No. 4½ gauge.

This form of cable I used first in 1862 across the Lowesoft Roads, and although this is one of the most ship-frequented spots in the world, it has never once failed, and is so flexible and yet strong that ships' anchors never injure the insulated conductor within it.

The cable recently laid in the Mediterranean was paid out without a hitch of any kind, and I hope to have to report next August that a similar result has attended the laying of the new Atlantic.

It is my opinion that if the present companies were to reduce their charges to say five dollars for the address and half a dollar for every other word, they would get a much larger income than by the present tariff.

Hoping to have the pleasure of seeing you next year, and with lively recollections of the hospitable welcome I experienced last year,

I am, my dear sir,

Very truly yours,

CROMWELL F. VARLEY.

WE announced, some time ago, that a fleet had sailed from Malta, engaged in laying a cable from that island to Alexandria, in Egypt. A French exchange informs us that the work has been successfully performed. The enterprise was undertaken by the Telegraph Construction and Maintenance Company, for the Anglo-Mediterranean Telegraph Company; and its accomplishment opens a new line direct to India, from the great commercial centres of Europe, *via* Italy and the Isthmus of Suez.

ABOUT the year 1842, the observations of an English electrician disclosed the fact that when strong currents are passed continually in the same direction, the best copper conductors lose their tenacity, little by little, and become so rotten that the pressure of the thumb and finger suffices to break them. Observation with the microscope shows a complete change in the molecular state of the metal, at the point of fracture. It is thought that this change in the molecular state can be greatly retarded, if not altogether prevented, by the frequent reversal of the currents.

**Amputation of the Leg by a Flash of Lightning.**

The *Lancet* is responsible for the following: A boy of twelve, belonging to Kosk (Western Russia), who used to walk with a crutch, on account of ankylosis of the right knee, was on horseback in the fields, when he was overtaken by a violent storm. After a severe clap of thunder, the horse ran away, and the boy, completely stunned, fell to the ground. When he returned to his senses and tried to rise, he found that his right leg was gone. His uncle, who had ridden by his side, and his own horse, had disappeared. The poor boy, at first somewhat collapsed, fell asleep. His companion, however, at last returned, after having secured the horse, and on examining his nephew he observed that the right leg was entirely wanting. The patient's shirt and clothes were in shreds, and burned along the seams, and on the body were many scars. The boy was conveyed to the village in a cart, suffering severely in the stump, and much alarmed at the hemorrhage, which, however, soon stopped. A few days after Dr. Rogowitch found a regular wound as usually made by the amputating knife, surrounded with granulations, and presenting in the centre a few gangrenous spots. The division had been effected by lightning, through the superior extremity of the tibia, the patella and femur being intact. The healing of this wound took place very rapidly, and by the use of ordinary means. The leg was found on the grass, several days after the accident, just where the boy had been thrown from his horse. It was quite dried up, and emitted no smell, the tibia being quite black, and stripped half down the leg.

**Insulating Electric Telegraph.**

Samuel C. Bishop, of New York, has obtained a patent for a new insulating compound for telegraph wires and other electric conductors, which is very much cheaper than india-rubber or gutta-percha, or the compounds of those materials previously used, and is said to be very effective and durable.

OUR French name-sake, *Le Journal des Telegraphes*, for October, devotes several pages to explaining and praising a new "meteorological clock," made by M. Secchi. From the description, it seems to be a complete meteorological observatory. A balance barometer and a metallic thermometer trace enlarged curves of variation of the atmospheric pressure and of the temperature; a pluviometer measures the rain-fall for twenty-four hours. Automatic organs, veritable telegraphs put in action by electric currents, show the direction and velocity of the wind, the hour and time of continuance of the rain-fall, and trace the two curves indicated by the psychrometer, which measures the tension of the aqueous vapor in the atmosphere.

The action of the clock causes three movements. It displaces horizontally the pencil which scores the quantity of rain which has fallen. It moves the knob of the lever which marks the line proportional in length to the velocity of the wind; and, finally, it regulates the apparatus which indicates the hygrometrical state of the atmosphere. The electric currents are supplied by a Daniel's pile, of fifteen couples, mounted with sand. The constancy of the clock is remarkable—as it will perform all its functions for a full year, without other attention than the addition, each month, of a little water and sulphate of copper.

The apparatus seems to be destined to render great services to science—the ingenious arrangements of the inventor causing the phenomena to trace their own curves of variation.

Upon M. Secchi's table of registration, there are found noted, side by side, the elements necessary to keep account of the state of the atmosphere, and to appreciate the extent of the perturbations which have happened at any given moment.

**Personal.**

J. T. Hanford, of Cincinnati, has accepted a position in St. Paul, Minn.

Frank Howe, of Ducesson, Pa., has been appointed to a position in Connorsville, Ind.

E. T. Gilliland, of Cincinnati, is on a visit to Michigan. Mr. Dave is working as a "sub" in his place.

Ellis Wilson, one of the old liners, has resigned his situation in Cincinnati to accept a more lucrative position in Nashville, Tenn.

We omitted in our last to notice the appointment of Thomas Dolan to the night managership of the central office of the Western Union Telegraph Company, New York. He has earned this honor by marked steadiness of conduct and executive ability. We think Mr. Dolan became an operator under our own superintendency, and we know that we have never trusted in one more implicitly. A true man will always come out right. The management of so important a trust could not be in better hands. Success to him.

**Electricity and Light in Defensive Warfare.**

We learn from a foreign journal that a course of experiments has recently been made at Antwerp, in Belgium, by a corps of engineer officers, with a view of strengthening the defenses of the passes of the river Scheldt, upon the bank of which the city is situated, by means of torpedoes, arranged in three lines, the explosion of which being regulated by the camera obscura. When this instrument is fixed at a certain angle, the image of a ship passing directly over any one of the series of torpedoes is reflected upon a mirror placed within the camera. An electric current, generated by a galvanic battery, or by a magneto-electric machine, is then made to explode the torpedoes, which it does instantly. The mines are each numbered, and have corresponding marks in the chamber.

The same journal states that the city of Venice was defended in the same manner, during the late Italian war. All the trials which have hitherto been made have succeeded most admirably, and the arrangements are very soon to be replaced by others constructed on a much larger scale. The report does not state the name of the inventor, nor the material used in charging the torpedoes. We should naturally surmise, however, that the latter was nitro-glycerine, as that substance is easily exploded under water by means of electricity, and possesses a terrific power in a very small space.

We shall expect soon to see the cities of New York, Boston, and other American maritime cities, defended in the same way, and perhaps with important improvements. Our engineers and chemists are not generally far behind those of other countries in such matters, and it will be strange if they neglect to avail themselves of this for a long time.

**Purged.**

PITTSBURG, Nov. 7, 1868.

To the Editor Journal of the Telegraph:

An operator, signing himself "Pittsburg Operators," following the illustrious example of the three tailors of London, who signed themselves, "We, the People of England," endeavors to create the impression abroad that a disaffection which exists only in his own brain, is shared by the operators in this office.

No better proof of his error should be required than the fact that his discharge was felt to be a relief to every operator in the office; and, in justice to the operators of "G" office, it is only fair to say, that, however hard their work may be, they perform it faithfully, and that they have honorably resisted the efforts of this one man to sow discord among them.

RELIEF.

**Notice to Offices of the Western Union Telegraph Company.**

As the official tariff sheets are printed in the JOURNAL only, all offices are required to keep the same on file for purposes of reference. When a new office is opened and the JOURNAL is received, the Manager will pay to the Postmaster the postage as a regular subscriber, and charge in his monthly account. In case of missing numbers application will be made to the District Superintendent.

**How to Stop Earthquakes.**

The authorities of Jaszberney, a Hungarian town, have just had the following notice published to the sound of the drum:

"Seeing that oaths and blasphemies are the real causes of earthquakes, every one, no matter who, is forbidden to swear or use bad language under penalty of receiving 25 stripes with rod and paying a fine of 25 florins.

**New Galvanic Exciting Liquid.**

M. Delaurier has communicated to the Academy of Science a note upon a new exciting liquid for galvanic batteries. He states that, "in order to obtain very powerful batteries disengaging no deleterious gas, and of very cheap maintenance, I have proved the problem of transforming azotic acid into sulphate of ammonia, under the influence of sulphuric acid and hydrogen." This is done by the proto-sulphate of iron. The proportions in these liquids are twenty parts in weight of proto-sulphate of iron dissolved, sheltered from contact with the air, in thirty-six parts of water, to which is added, with stirring, seven parts of diluted (equal parts) sulphuric acid, then, in the same manner, one part of diluted (equal parts) azotic acid. M. Delaurier states that the liquid produced is the most energetic and most economical that he knows for an exciting liquid for iron zinc, without any disengagement of hydrogen or binoxide of azote.

In the use of this liquid with nitric acid, the action goes on without any exterior emanation of nitrous gas, and without the emission of hydrogen in the interior.

THE poles recently erected for a telegraph line between Saakin, in the Red Sea, and Cassaba, in Egypt, have been so eaten up by ants, that iron poles have to be substituted before the line can be opened for use.

THE English papers notice the extraordinary rapidity of telegraphic intercourse between Cuba and Europe.

The cable to be laid in the Black Sea as a part of the Indo-European line will be covered with a sheathing of copper, under the direction of M. Siemens, and will have three conductors.

PROF. TYNDALL denies the story headed "Vandalism," which accuses Mrs. Farraday of giving into the hands of a porter the valuable apparatus of her distinguished husband. These were distributed worthily, and the most valuable to parties named by Farraday himself.

SOME important changes are going on in the large battery room of the central office of the Western Union Telegraph Company, New York, under the care of M. V. B. Buell, respecting which we are promised a full report. The number of cells has been reduced one half, and yet the lines have been worked with increased ease and efficiency. The times seem full of promise and progress.

THE accession of books to the British Museum Library averages 20,000 volumes per annum, or about 50 to 60 volumes per day.

## Journal of the 'Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address— JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, NOVEMBER 16, 1868.

### To Subscribers.

*As most of our subscription list commenced with the publication of the paper, our subscribers will be kind enough to remit promptly one dollar for the coming year. The price to clubs will be as before.*

### End of Volume 1.

With the present number our first volume ends. We trust that the new one will be opened with no breach of the large circle of readers who have cheered and borne with us during the year. We have to thank them all for their patience, and many of them for their aid. The editorial chair is not always cushioned, even if the sphere of its work be narrow, and in that undefined dread with which a novitiate commits himself to the criticism of thousands of unseen eyes, we have needed and been gratified with kindness beyond our merit.

Our second volume will, we trust, show the benefit of the past year's education, and be increasingly useful and welcome. We desire to stimulate and introduce every element which may render labor in the wondrous and widening field of electrical communication cheerful and honorable. We design to do our best to unite the President and the messenger boy with every interconnecting link in a hearty and kind and energetic co-operation. We shall utter whatever thought shall seem best designed to promote harmony in the common toil, and gather knowledge from all possible sources for our mutual pleasure, education, and advancement. We conceive this to be a worthy vocation and an honorable sphere, one in which we have been left untrammelled hitherto, and so design to be, now and evermore.

On the opening page of the new year our readers will find an admirable likeness of Professor Morse, whose young face, even at 77, sometimes glows into our own as the memories of other days light up both in merry radiance. And other faces will greet you, gentle reader, if you continue, as we trust you will, your good cheer and company.

### The Panama Line.

No progress has been made with the cable line between Cuba and Panama, except organization and a partial examination of the route. Events, however, are culminating, which will demand its prosecution. The isthmus of Panama separates America from a vast commerce, and it must be pierced. This was one of Napoleon's great projects. He saw there the gateway to the western world. It must become so. The avenues of intercourse by land and sea must all

be opened. The belt of fire is kindling the hearts of nations to each other, and giving an idea of proximity never so great as now.

These projects, both the Darien Canal and the Cable, have great significance in reference to the future of the United States. Darien will one day become the terminal point of the Republic. Mr. Seward has spent a week among our distinguished merchants and men of enterprise in a quiet discussion of the magnitude of the interest this nation has in connecting the waters of the two oceans, so that ships from China and our own Pacific coast can come direct to our Atlantic harbors. He evidently deems the time to have come to push this grand work to fruition. One of the first things needed will be the cable, just as Napoleon finds it essential to connect the French imperial offices with Suez, where a similar work is in progress to connect Europe with the eastern world.

Not only so, the other day we received a visit from Mr. I. Studdy Leigh, an intelligent representative of the Telegraph Maintenance Company, of England, who had just procured the offer of half the capital necessary to lay cables from Panama southward, to connect with the South American lines. The other half will be taken in England. The Cuba and Panama cable must be laid to connect South America with the world. So, gentlemen, get your arrangements completed speedily. A year is a long time to wait now-a-days on any thing. Let 1869 see your work *un fait accompli*.

### Phelps' Printing Telegraph Instrument.

We have rarely been more agreeably surprised than in a private exhibition of this beautiful and effective triumph of mechanism just completed by George M. Phelps, the skilled superintendent of the Williamsburg works of the Western Union Telegraph Company. In simplicity of mechanism, in perfection of motion, in economy of power, in rapidity and certainty of execution, in a general conception given the observer of ease of action as when fluent lips utter musical sounds, this instrument surpasses anything we have yet seen. A single cup of battery, costing 20 cents per day to maintain it, is all the motive power it requires, and this gives steady action to machinery which so far has been performed by manual labor.

In this machine the type wheel is detained for the stroke, rendering it clear and complete, and the fingers can play among the letters, backwards and forwards, up and down the alphabet, with an ease and freedom little less than marvelous. It utterly knocks into shade all existing printers, and must be regarded as a vast addition to the means of electrical communication.

We notice that our European electricians are very much exercised over and interested in the story we mentioned recently of Mr. Mower's so-called "water telegraph," and experiments by which he says he transmitted messages across Lake Ontario, from Toronto to Oswego, without wires.

The scientifics over the ocean are anxiously awaiting Mr. Mower's arrival, to establish telegraphic communication between Oporto, in Portugal, and Montauk Point, on Long Island, and estimates that, as his apparatus for such an enterprise will cost \$10,000, and a submarine cable costs five or six millions, Mr. Mower will have a monopoly of the business, by sending messages at rates which will very soon ruin George Law and his French competitors, as well as Cyrus Field and the Britishers.

We have no doubt Mr. Mower would be very willing to sell out his rights to either of his competitors for \$10,000, before the disclosure of his "secret" reassures their stockholders as to the prospect of the bankruptcy.

*Remember to mail one dollar for the new volume.*

### Obituary.

Our lives are rivers, gliding free  
To that unfathomed, boundless sea,  
The silent grave.

It is our melancholy duty to announce the death of the accomplished wife of General T. T. Eckert, General Superintendent, Eastern Division, Western Union Telegraph Company. This sad event occurred on Wednesday morning, November 4, after a long and painful illness, which was borne with the most exemplary patience and Christian resignation. Her death was calm and cloudless, and for which all her life had been a sacred preparation.

Mrs. Eckert was a lady of unusual excellence, and of remarkable strength and purity of character. Her appearance was one of exceeding comeliness, and there was united in her a rare gentleness of manners with a sunny placidity of disposition which made her presence always attractive and desirable. Her own home was a place of perennial sunshine and joy. She has left a wide circle of friends to mourn her departure.

To him, whose home and heart are so darkened by this deep affliction, as well as to the bright and loving children who are now deprived of the guidance and care of a most faithful and devoted Christian mother, we offer our warmest sympathy and condolence. Although lost to them here, their whole lives can hardly fail to be purified by her sacred memory.

The funeral services were attended at St. Paul's Church, New York, Sunday, November 8, by a large number of the friends of the family, and of the officers and employees of the Telegraph Company.

### Insurance.

The annual meeting of the Telegraph Mutual Life Insurance Association was held on Monday, the 2d inst. A statement of its condition and prospects was made by the treasurer. He reported that 350 certificates had been issued. Upwards of seventy new members had joined since the deaths of Hall and Christie. The response to the double assessment made in consequence of these deaths was prompt and general.

The former committee were selected for the ensuing year, with the exception that Mr. B. F. Ely, on the nomination of Mr. Downer, was elected secretary. Mr. Ely, however, having declined to act, the executive committee have invited Mr. Downer, who was elected assistant secretary, to continue his services as formerly, which he has kindly agreed to do. Applications will therefore be made as formerly to D. R. Downer, Secretary.

We have received a letter from the manager of a telegraph office asking certain questions respecting the effect of escapes at different points, upon sending and receiving offices, according to locality. The questions propounded at first seemed easy enough to answer, and had we stated simply our own experience, reply could readily have been given. A little reflection, however, has caused us to determine to publish an elaborate reply on data furnished from the most skilful sources, and which we will give in the first or second number of the new volume, properly illustrated. We design, during the coming year, to furnish as ample information on all such subjects as the literature or experience of electric science can provide, and will endeavor to make the JOURNAL much more useful than it has been. In this we will have the aid of experienced friends, who have promised to devote to us a part of their hours of leisure, and of which our readers will have the full benefit.

It is said that a current of electricity, produced by a powerful electro-magnetic machine, and directed upon a solution of brown sugar, whitens it quite as effectively as any of the agencies usually employed for that purpose.

For Tariff Circular see page 6.

**Peru.**

The Peruvian Congress has passed a bill for advancing the National Telegraph Company a loan of £100,000 in the reserved bonds of 1865, which the Senate has approved.

**Samuel C. Bishop and Tillotson & Co.**

Messrs. Tillotson & Co., New York, and Bliss, Tillotson & Co., Chicago, have been appointed agents of Samuel C. Bishop, of New York, for the supply of his well known gutta percha goods. We have a piece of cable before us manufactured by Mr. Bishop, which will bear comparison with any of foreign manufacture. These cables the houses of Tillotson & Co. will provide.

At Racine, Wis., Belle City Hall was made a vast telegraph office for the reception of the election returns, and gave great gratification to the public. For this they were indebted to Superintendent E. O. Wait, whose public spirited discernment led him to this graceful and grateful public act. Stimulated by Mr. Wait's generosity, the ladies of Racine opened rooms below where they provided the crowd with oysters and other suitable refreshments.

A FEW days ago we enjoyed the pleasure of a call from M. Michel, an engineer in the service of the French Imperial Telegraph, who has been here on a short furlough to "do up" the United States, and enjoy a respite from business. He returned to la belle France, October 17th, on the Ville de Paris, and on his return expects to be immediately engaged in the erection of new lines across the Alps, and the laying of a 25 wire cable through the Mount Cenis tunnel. M. Michel is a young, sprightly, intelligent Parisian, from whom we expect to hear occasionally, making us familiar with the European processes, and the extension of European lines.

We learn from him that, by law, no messages are allowed to be taken by sound. All messages sent by the Morse alphabet are received upon a Morse registering apparatus, in which an inked platinum wheel with sharp rim takes the place of the ordinary styles. The rate of transmission is about 50 letters per minute, much slower than with us, and the strip on which the message is recorded is filed away for reference. The registers are very cheap, costing not more than 15 to 20 francs, while American registers cost 250 francs in gold.

GALESBURG, ILL., August 5, 1893.

To the Editor Journal of the Telegraph:

DEAR SIR—I enclose, by request of W. McKee, our operator at Neponset, an advertisement he wishes inserted in your paper.

His Signal Box is really a valuable thing for any railroad company who are handling their trains by telegraph, and railroad companies who do not do so, at this late day, are sadly behind the age.

F. H. TUBBS,  
Supt. R. R. Tel. Dept.

TO ALL R. R. COMPANIES AND TO ALL SUPERINTENDENTS OF R. R. TELEGRAPH LINES.

We desire to call your attention to our new  
PATENT SIGNAL BOX

for flagging trains by day or night for Telegraph orders. A RELIABLE arrangement for this purpose has long been needed, and we claim to have found it. Our Signal Boxes are cheap, durable and reliable.

The signals (flag by day and lamp by night) are conspicuously placed at each telegraph office in full view of all trains and the operator, who can display and conceal them without leaving his instruments, and without even "breaking" in on the train-order he is receiving.

Being constantly in view, there is no possibility of their being blown down without the operator's knowledge. The Chicago, Burlington and Quincy R. R. Co. are using our Signal Box at all Telegraph Offices, and we are permitted to refer to them. We have recently disposed of the right to use them on several Roads, and now offer them to all Railroad Companies at a low rate,

McKEE & LEE,  
Telegraph Office,  
Neponset, Ill.

OFFICE OF PHOENIX IRON COMPANY,  
410 Walnut Street,  
PHILADELPHIA, November 6th, 1893.

DAVID BROOKS, Esq.:

DEAR SIR—We have been using your new Insulators upon a Telegraph Line erected for our own use, between this office and our works on the Schuylkill, a distance of twenty-nine miles, and take great pleasure in saying that during the past three months that the line has been in operation they have given us most perfect satisfaction in every respect.

Very respectfully yours,

B. B. AERTSON, Secretary.

CHESTER, PARTRICK & CO.,

TELEGRAPHIC & ELECTRICAL ENGINEERS.

CONTRACTORS, &c.,

38 SOUTH FIFTH STREET,

PHILADELPHIA.

Manufacturers and Merchants of every variety of

TELEGRAPHIC, ELECTRIC AND PHILOSOPHICAL APPARATUS, BATTERIES, WIRE, ACIDS, INSULATORS, MEDICAL INSTRUMENTS, AND SUPPLIES.

Respectfully announce that they have increased their facilities for the prompt execution of all orders with which they may be intrusted, whether for the construction of any or all lines of telegraph, or for the supply of apparatus or material.

Among other recent improvements, for which they have secured the sole or part agency, attention is called to the following novelties:

1.—Patent anti-trunion Key with eccentric circuit closers.

2.—Patent Self-closing anti-trunion Key.

3.—Kerite or (horn covered) copper or compound wire or cables.

4.—Covered compound out door line wire.

5.—Blasting apparatus, cartridges, batteries, &c., &c.

6.—Calcium lighting apparatus.

7.—Medical and test batteries, direct and induced currents.

8.—Apparatus for electrical measurement.

9.—Electric gongs of any desired size or weight; alarm apparatus, &c., &c.

10.—Electrical clock work and experimental apparatus of every kind.

The success of the past year and increased resources warrant the promise of dispatch in the execution of all orders, upon terms satisfactory to our customers.

**MARRIED.**

In Providence, on the 28th ultimo, by the Rev. J. G. Vose, Mr. Alfred H. Betts, late of the Western Union office in that city, to Miss Kate M. Phillips, also of Providence.

DURANT'S

NONPAREIL RELAY.

PATENTED MAY 19 AND JUNE 30, 1893.

This Instrument, having been thoroughly tested on the principal Telegraph Lines in this country, is now offered for sale. It has proved itself a practical

SELF-ADJUSTING RELAY

under all ordinary conditions of the circuit. It will be found especially valuable in

RAILWAY TELEGRAPH OFFICES,

where the operator, being frequently otherwise employed, cannot be in constant attendance upon his instrument.

THE BUNNELL REPEATER,

by the use of this Instrument, is rendered practically Self-adjusting, entirely obviating the annoyance frequently arising from the inattention of operators at repeating offices.

THE NONPAREIL RELAY

is finished in a manner superior to any other instrument in the market.

BRADLEY'S PATENT NAKED WIRE HELICES,

the best in use, are used in this instrument, except when otherwise ordered. The parts of the Instrument are

MADE INTERCHANGEABLE,

so that a duplicate of any portion can be furnished at any time.

The ordinary resistance of this Relay is equal to about Thirty Miles of No. 8 Iron Wire.

Relays of any required resistance will be made to order.

PRICE, \$30.

THE USUAL DISCOUNT TO DEALERS.

The following Testimonials, out of a number of similar tenor, are presented as a guarantee of the reliability and perfection of the working of these Relays:

NEW YORK, June 23, 1893.

MR. J. C. HINCHMAN,

Supt. Met. District, N. Y.

I have observed the working of Durant's Self-adjusting Relay, which has been on trial at this office during the past week, and feel warranted in saying it is a Self-adjuster, and as such, will work steadily on wires which, with an ordinary Relay, can only be worked with difficulty.

Very respectfully,

A. S. BROWN,  
Manager.

NEW YORK, June 24, 1893.

MR. A. S. BROWN,

Manager W. U. Tel. Office, N. Y.

On the 18th of this month Superintendent Hinchman directed me to try Durant's Relay on our circuits, and report upon its merits. Since the above date it has been in operation here continually.

I have tried it upon many of our wires, and find it works equally well on all of them.

There has been but one rainy day during the meantime, and on that day it worked very satisfactory over escape and changeable currents.

On the 18th inst., Nos. 33 and 34 south were lying on the ground, between Elizabeth and Somerville, N. J. We could just get Philadelphia by very high adjustment with ordinary Relay, while Durant's Relay recorded Philadelphia's writing as well as upon a clear wire. From the various tests I have submitted it to, I have no doubt that it is a Self-adjuster, and as such will work where any ordinary Relay can be adjusted to work.

Very respectfully yours, &c.,

A. S. DOWDER,

First Chief Operator, W. U. Tel. Co.,  
145 Broadway, N. Y.

For a full description of the construction and advantages of this Instrument, see JOURNAL OF THE TELEGRAPH of Nov. 16, 1893.

Address all orders to

CHARLES DURANT,  
Office and Factory 66 South St.,  
New York City.

## TARIFF BUREAU.

## Semi-Monthly Circular.

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
November 16, 1898.

To all Offices on W. U. Lines—

The following changes have occurred since Nov. 2, the date of the last Tariff Order. Please note them in your Tariff Book:

## NEW OFFICES.

Berrian Springs, Mich., tariff same as Niles, Mich.  
Braceville, Ill., tariff same as Gardner, Ill.  
Casey, Iowa, tariff same as Adair, Iowa.  
East Dennis, Mass. (re-opened), tariff same as heretofore.  
Enterprise, Pa., tariff same as Titusville, Pa.  
Lafayette, Tenn., tariff same as Collierville, Tenn.  
Oakland, Md. (re-opened), tariff same as heretofore.  
Pittsfield Station, Me., tariff same as Newport, Me.  
Rienzi, Miss., tariff same as Baldwin, Miss.  
Scottsville, N. Y., tariff same as Mt. Morris, N. Y.  
Searcy, Ark., tariff same as Augusta, Ark.  
Tupelo, Miss., tariff same as Verona, Miss.  
Warner, N. H., tariff same as Bradford, N. H.  
Whiteland, Ind., tariff same as Franklin, Ind.

## OFFICES CLOSED.

Adair, Iowa, Chili, N. Y., Cornwallis, West Va., Collierville, Tenn., Fremont, Neb., Pandora, Iowa, and Waverly, Tenn.

## GENERAL INFORMATION.

The following rates to points on the Anglo-Mediterranean Telegraph Line will take effect December 1, 1898:

From London, England, for a message of 20 words

To Malta, . . . . . \$2.50	To Alexandria, . . . . . \$7.50
Tripoli, . . . . . 4.25	Cairo or Suez, . . . . . 8.50
Benghazi, . . . . . 5.88	Stations on Suez Canal, 9.00

Half the above rates for every additional ten words, all in gold. These rates will not affect those now in use to India, China or Australia.

Offices having "Special Sheet A" will check Wankegan, Ill., Racine and Kenosha, Wis., fifteen cents more than "special rate" to Chicago.

All offices having "Special Sheet A," which send business for St. Louis, Mo., and Detroit, Mich., via New York or Albany, will collect the following rates:

For St. Louis, \$2.00 added to special rate to New York or Albany.

For Detroit, \$1.25 added to special rate to same points. The rate to be taken will be that which, after adding, is found to be the lowest.

Charge for delivery from Boston to Cambridge, Mass., is 50c. In the JOURNAL of October 15 the words "paid or," in notice referring to Cape Breton business, should be struck out.

Tariff to Eldorado, Ark., in JOURNAL of Nov. 2d, should be same as Minden, La., instead of Meriden.

WILLIAM ORTON,  
President.

## Among the Wires.

BY A LADY OPERATOR.

"Knowledge is power,"—on an average, but not on the wires. The less retentive the memory is with regard to the contents of a telegram, the better for the manager of a telegraph. So much of the information gained from the wires must go for nothing, as far as the diffusive faculties are concerned, the conscientious manager (the undersigned!) comes, ere long, to regard all this panorama of life forever passing before his eyes, as departing therefrom into a vast Dead Sea of facts, which memory silently and sacredly holds, or as silently banishes, unwilling to retain an interest which must be ever unshared.

A great deal may be done in the way of cultivating an ignorance of all the business one has transacted, so as to put it beyond our power to recall a message of the morning, or even of an hour ago, however important it may have been. "Don't you find it hard to keep all these secrets?" says Uncle Sam.

The fact is, my dear sir, it would be harder to find one to keep.

All these things pass from the ear down the right arm and off the point of the pen, and I would as lief undertake to denote the precise locality of the fire flies glistening in the meadow, as trace out any particular strain from this incessant medley of the wires. Just after the arrival of a message stating that all

the seats at the theatre are taken up, five men, who didn't know anything about it, have just left with me five telegrams which ask for "a good seat at the theatre."

"Ah! thank you." And off they would have gone, tearing in pieces the five telegrams, and the company have lost five dollars or so.

By giving them such information, I should not not only have disregarded the ordinary requirements and licenses of trade, but an express statute of the company enjoining secrecy with regard to the contents of all telegrams.

An incident occurred in my hearing some time since the war of 1812 (hope I have warded off suspicion by coming no nearer home), which strengthened a former conviction that the telegraph manager should exercise judgment even in indirect remarks which border upon forbidden ground, and in some cases have all the effect which a direct divulgement would have.

The news had come that a certain insurance company had failed, and become unreliable. Subsequently this report was contradicted in a telegram to an interested party, who made no secret of the matter, it being presently talked of at the street corners as a public affair. Several days after, a citizen dwelling in the outskirts of the town, who had heard the report, but not the contradiction, hastened to the telegraph office to insure by telegraph certain property in another insurance company, stating that the former company was now unreliable.

"So that company isn't good after all," incautiously remarked the manager.

"After all? After all *what*?" nervously inquired the man, reaching his hand as if to take back his message.

"After what I heard on the street the other day, I had an impression that——"

"Oh, yes; ah, well, I thought you got the facts from some message." The outstretched arm falls, and the message is left in the manager's hands, who is inwardly thanking his stars that he has managed the case so successfully.

Yet, I could but believe that *science* would have been the better management.

Silence is not hypocrisy, nor non-committalism falsehood. It is simply to abstract oneself from what is really no part or parcel of our knowledge. And, after all, it is with the mechanical part of his business that the self-interest of the telegraph manager is concerned, and his memory has room for little else. If the state of the wires is such that he may receive and transmit his messages in season, it is the most that he cares to know, and you may buy and sell over his wires, miss the trains, run off with your neighbor's horse, forge, speculate, swindle, be a knave, cheat, rogue, villian, liar, you may get run over, drowned, shot, hung; and among the thousand eddying currents of your doings and undoings, and over them all he will glide, oblivious of what is behind, invulnerable as to what may be before.

## Patents.

J. L. CLARK, Surrey, England—*Differential Galvanometers*.—This invention consists in the construction of an improved form of testing galvanometers by a new arrangement of circuits of a differential galvanometer, so as to render it more portable and applicable to testing the insulation of telegraph lines as well as delicate and powerful currents. This improvement is effected by attaching a shunt or derived circuit to both of the coils of a differential galvanometer as a permanent part of the machine, and providing plugs by which either or both of the said derived circuits or shunts can be thrown into operation, and the patentee combines this improvement with such an arrangement of the terminals as renders it superior to any form of testing galvanometers known.

J. L. PULVERMACHER, London—*Producing, applying and ascertaining the power of electric currents*.—This invention relates, first, to a single liquid battery for constant currents; second, to an automatic current breaker or interrupter; and, third, to an instrument for ascertaining the power of electric currents.

## Telegraphers'

## Mutual Life Insurance Association.

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postage, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

D. R. DOWNER, Secretary.

W. O. LEWIS,  
A. S. BROWN,  
W. H. HILL,

Executive Committee.

J. D. REID, Treasurer.

## DIRECTIONS TO APPLICANTS.

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signatures of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

By permission of the Western Union Company, and to avoid risk by mail, remittances may be made by an order signed by a Manager on John Horner, Cashier, New York office. Whenever practicable it is desirable this should be done.

They publish an Illustrated Descriptive Catalogue of their leading manufactures, to which they respectfully refer.

**AMERICAN COMPOUND TELEGRAPH WIRE.**SUPERIOR CONDUCTIVITY,  
LIGHTNESS AND DURABILITY.

A MOST IMPORTANT INVENTION.

We would call the attention of Officers of Telegraph Companies, Telegraph Builders and Contractors, and the Public, to the new

PATENT COMPOUND TELEGRAPH LINE WIRE.

Manufactured by the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY,  
OF NEW YORK.

This Wire has already been put up on sections of several Telegraph Lines, and its merits fully tested, and the results show that it combines all the good qualities which are claimed for it, viz., *Economy, Superior Conductivity, and Increased Strength, with Decreased Weight of Metal.*

In its composition are used three metals, either of which is a good conductor, Steel, Copper and Tin; and the superiority of Copper as a conductor over other metals is well known, and but for its ductility rendering its permanent suspension in a pure state intact impracticable, it would have always been used exclusively as a Conductor on Telegraph Lines. By combining it with Steel the desired strength and permanence is attained, and the necessary weight of the line wires reduced two-thirds, thus obviating the necessity for using a large number of poles to the mile, and by reducing the points of contact, lessening the chances for trouble and escape of the electric fluid.

All other Line Wires must inevitably be superseded by this, and such Telegraph Companies as now adopt it will the sooner realize the advantages to be derived from its use over those whose lines are of the old rotten and rusty iron wire pattern.

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed. His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them.

Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

NEW YORK, DECEMBER 1, 1868.

VOL. II.

## SAMUEL F. B. MORSE.

Inventor of the American Electro-Magnetic Telegraph.

WRITTEN BY THE HON. AMOS KENDALL.

Samuel Finley Breese Morse is the oldest son of the Rev. Jedediah Morse, D. D., the author of Morse's *Geography*. He was born at Charleston, Massachusetts, on the 27th of April, 1791. His mother's name was Breese. She was a descendant of the Rev. Samuel Finley, D. D., a former President of Princeton College. From this ancestor and his mother, Professor Morse derives his Christian name.

He graduated at Yale College in 1810.

Young Morse had a passion for painting so strong that, in 1811, his father sent him to Europe, under charge of Mr. Alton, that he might perfect himself in the art to which he desired to devote his life. He had letters to West and Copley, and soon had the satisfaction to excite the peculiar regard of the former, who was in the zenith of his fame. In May, 1813, his picture of the "Dying Hercules" was exhibited at the Royal Academy, Somerset House, eliciting much commendation. Auxiliary to the painting of this picture, he had molded a figure of "Hercules" in plaster, which he sent to the Society of Arts to take its chance for a prize in sculpture. His adventure was successful, and, on the 13th May, 1813, he publicly received a gold medal with high commendation from the Duke of Norfolk, then presiding.

Thus encouraged, the young artist prepared a picture representing the "Judgment of Jupiter in the case of Apollo, Marpessa and Idas," to contest the prize of a gold medal and fifty guineas offered by the Royal Academy in 1814. Being called home before the exhibition, his picture was denied admittance, because he could not attend in person. West, the President, to whom he exhibited the picture after it was finished, advised him to remain, and after the public exhibition wrote him that he had no doubt it would have taken the prize.

In August, 1815, Morse returned to his own country flushed with high hopes, based on his success abroad. He opened his rooms in Boston, where he exhibited his "Judgment of Jupiter," but for a whole year he

did not receive a single offer for that picture or a single order for any other of an historical character. This was a cruel disappointment; for in that direction his ambition lay. Having thus far depended on means derived from his father, and seeing no prospect of independence in that line, he betook himself to portraiture, and in that pursuit visited various towns in New Hampshire. In a few months he returned with considerable money acquired by painting small por-

trait of his uncle finally attracted so much attention that orders at sixty dollars each came in much faster than he could execute them. With three thousand dollars in hand, and engagements for a long time to come, he returned to New England and married Miss Walker. For four successive winters he returned to Charleston in the practice of his art, where he was not only successful, but was respected and beloved.

In January, 1821, Morse, in conjunction with John S. Boydell, originated the "South Carolina Academy of Fine Arts," of which the late Joel R. Poinsett was President. It was incorporated, and had several exhibitions, but has been broken up for lack of adequate support.

Circumstances awakened anew Morse's ambition for distinction as an historical painter. He conceived the idea of painting the interior of the Representatives' Chamber in the Capitol in Washington, and raising a revenue by its exhibition. He located his family in New Haven, and devoted eighteen months to the painting of this picture. It measured eight feet by nine, and contained a great variety of figures. Its exhibition, however, instead of producing an income, resulted in a considerable loss, and this with contributions, in common with his brothers, to discharge their father's pecuniary liabilities, swept away all he had accumulated at Charleston.

Morse then sought employment in New York, and finally obtained from the corporation an order to paint a portrait of Gen. Lafayette, who was then in the United States. For that purpose he visited Washington; but, in February, 1825, he was called home by news of the death of his wife. His labors upon this picture were further interrupted by the sickness of his children, and the death of his excellent father and mother.

Morse now made New York his place of residence. In the Fall of 1825, he was active in organizing a drawing association,

which constituted the germ of the "National Academy of Design," of which he was President for many years after its organization. Though gotten up under great difficulties and amidst much controversy, this institution was eminently successful.

In 1827, Morse delivered, before the New York Athenæum, the first course of lectures on the fine arts ever delivered in America.

In 1829, he again visited Europe, spending three

MORSE'S FIRST TELEGRAPH REGISTER.

months at fifteen dollars each. On that trip he became acquainted with Miss Walker, whom he afterwards married. He also fell in with a Southern gentleman, who assured him that he could get abundant employment in the South at quadruple prices.

On writing to his uncle, Dr. Finley, of Charleston, that gentleman gave him a cordial invitation to his house while he made the trial. He complied, and, although for a time his prospects were gloomy, a por-

years among artists and collections of Art in England, Italy and France. In Paris, he painted the interior of the Louvre, copying in miniature the most remarkable paintings hanging on its wall. In the Fall of 1832, he returned to the United States, and resumed his position as President of the National Academy of Design, to which post he was elected every year during his absence.

When American artists were to be employed to fill with a picture one of the vacant panels of the rotunda of the Capitol, the American artists, it is believed without exception, considered Morse best entitled to the honor; and great was their disappointment when another was selected. They exhibited their sense of the wrong done him by voluntarily raising a subscription to pay him, for a picture suited to such a national object. A considerable sum was collected and paid over to him, but not enough to enable him to complete the design in a manner satisfactory to himself. Determined that no man should have an opportunity to charge him with appropriating his money without an equivalent, he resolved to refund the amounts paid over to him; and, though sorely pressed, never ceased his efforts until he had paid back the last cent.

Professor Morse, under the most straitened circumstances, had an insuperable repugnance to contracting debts, or living on the bounty of others. His dying mother, after encountering much suffering from the kindness of his father in lending his name to friends whom he trusted, exacted a promise from her son that he would never thus endanger his own peace of mind and the comfort of his household, and to that promise he has religiously adhered.

During his collegiate course, ending in 1810, Professor Morse had been instructed by Professor Silliman in all that was then known on the subject of electricity, and the formation of electric batteries. During the residence of his family at New Haven, or about 1824, enjoying the friendship of Professor Silliman, and having free access to his laboratory, he obtained from those sources full information of the progress of electrical discovery and science from 1810 up to that time. In the winter of 1826-7, he attended a series of lectures on electricity, delivered by Professor Dana in New York, and there saw the first Electro-Magnet which probably ever was exhibited in America. Dana was an enthusiast on the subject of Electro-Magnetism, and being an intimate friend of Morse, made it a topic of constant conversation. Had not death struck him down in the spring of 1828, he would probably have become the leading electrician of America.

Thus far, Morse had felt no other interest in electric science than that of a lively curiosity. During his voyage from Europe in 1832, circumstances occurred which awakened new thoughts, and opened a new path to distinction. On board the packet-ship Sully, in which he embarked, he met with Dr. C. T. Jackson, of Boston, Hon. Wm. C. Rives, of Virginia, J. Francis Fisher, of Philadelphia, and several other intelligent men. The conversation embraced a great variety of topics, of which recent experiments in galvanism and electro-magnetism were not the least interesting. Statements made by Dr. Jackson in relation to certain results he had recently witnessed in France suggested to Prof. Morse the idea that either the electro-chemical or electro-magnetic effect of the current might be used to make permanent marks at great distances, so varied as to communicate ideas. The project took full possession of his mind, and was the subject of his daily conversation and nightly dreams. He found the shapes of the Roman letters and Arabic figures, being composed of straight lines and irregular angles and curves, ill suited to be made at a distance by any simple machinery. He therefore changed their forms, making them of a straight line cut up into dots and dashes, and his letters and figures were made up of various combinations of these elements. This part of his invention was substantially matured on board the Sully, and drawn out in a sketch-book. He had also pre-

pared and drawn out in the same book a form of apparatus to make the letters and figures by the electro-chemical process, upon prepared paper, passing under the end of a wire or stylus, through which the electric current derived from the distant battery should be made to pass. He had also devised a species of types, to be used in breaking and closing the circuit, and giving greater or less duration to the current, as might be required to make a dash or a dot. It was agreed between him and Dr. Jackson that the latter, who had a laboratory, should try a series of experiments, to determine what chemical solution was best adapted to the purpose.

So engrossed was the mind of Prof. Morse with this project, that immediately after passing salutations with his brothers on landing at New York, he mentioned it to them, and immediately set himself at work to cast the type intended for the breaking and closing of the circuit, preparatory to the construction of the other machinery. But Dr. Jackson failed to make the promised experiments, and Prof. Morse, suffering under the blight of poverty, had no funds to purchase the necessary material, and was obliged to resort to his pencil for the means of subsistence.

Far from relinquishing his great project, it was the subject of constant thought; and, hearing nothing from Dr. Jackson, he devised a plan for making his letters and figures by electro-magnetism.

In 1835, Morse was appointed a professor in the University of New York. Having a room in the university, he constructed, of rude materials, a miniature telegraph, embracing all the elements of an electro-magnetic telegraph, composed of a single circuit, which he afterwards patented. This was shown to a few friends before the close of 1835. In 1832, his friend Dr. Gale had been appointed a professor in the same university. To him Prof. Morse showed his instrument, and disclosed all his plans. That an effective telegraph could be made on a very short circuit there was no doubt; but experiments indicated that the magnetic influence of the electric current rapidly diminished as the length of the circuit was extended, so as to make it uncertain at what distance sufficient power to make a mark, or even produce motion, could be obtained. Morse conceived a plan by which he could mark at any distance where he could produce motion. This was by employing the motion obtained upon a first circuit to break and close a second, which might be made as short as necessary to obtain marking power. But the idea did not stop there; it contemplated the use of the second circuit to close and break a third, and so on indefinitely. The obvious inconveniences of this plan, so far as the recording is concerned, are obviated by the introduction of the local circuits. Instead of shortening the main circuits, so that the power of their batteries shall be sufficient to record on all parts of the circuits, they may be extended as far as motion can be obtained, and this motion is used to break and close a local circuit wherever a station may be wanted. At first, the recording apparatus was only a register worked by an electro-magnet in the main circuit. Now the recording apparatus consists of a local battery and circuit, a register magnet and register, called into action by an electro-magnet in the main circuit.

Prof. Morse's merits as an inventor have been severely criticised, and attempts have been made to confine them to very narrow limits. What they really are, is now pretty well established.

In 1819, Oersted discovered that a current of electricity, passing on a conductor, would deflect the magnetic needle when brought near it. This was the discovery of electro-magnetism.

In 1810, Schiwyer conceived that if the current was made to pass many times around the needle by means of a coil of insulated wire, it would increase the force of the deflection. On trial the result was as he expected. This coil is called "Schiwyer's Multiplier."

In 1825, Sturgeon conceived that if the electric cur-

rent were sent through a wire coiled around a piece of iron, it would produce magnetism in the iron. He tried the experiment by insulating a round bar of iron, winding a naked wire spirally around it and passing a current through the wire. The iron became magnetic. This was the invention of the electro-magnet.

About 1830, Prof. Henry conceived that if Schiwyer's multiplier were applied to Sturgeon's electro-magnet, it would much increase its magnetic force. He wound insulated wire around the naked iron bar, making many turns, and, passing the current through it, found the result to be as he expected.

A variety of batteries had been invented.

One thing was yet wanting; that was, some means of renewing the magnetic force of the electric current before it becomes entirely exhausted by reason of the length of the circuit. That desideratum Prof. Morse supplied by his combined circuits. This, with his alphabet, and the new mechanism employed by him, constitutes Morse's invention; and these, in combination with the new result produced by him, are all he claims.

Other countries are doing honor to the American inventor. A telegraphic convention of the German States, of which Prof. Steinheil was the leading spirit, recommending Morse's invention in preference to his own, have adopted it for general use throughout Germany. He has received honorary testimonials from the Sultan of Turkey, the Kings of Prussia, Wurtemberg, Italy, Portugal and Denmark, the Legion of Honor from the Emperor of France, Knight Commander of the Order of Isabella from the Queen of Spain, while the French Academy, and the most distinguished savans in France and England concede his merits.

Even the adversary counsel, in an argument before the Supreme Court of the United States, admitted that Prof. Morse was the first to invent "*a practically useful electro-magnetic marking telegraph.*" The world will not hesitate to believe that which interested counsel do not think it expedient to deny.

#### MR. MORSE'S HOME.

Mr. Morse's residence stands about two miles south of the city of Poughkeepsie, in the State of New York, about a mile and a half from the banks of the Hudson, which it overlooks, upon a plain elevated about two hundred feet above the level of its waters. The deep cut of the Hudson River Railroad, two miles south of Poughkeepsie, is a part of Mr. Morse's estate, which extends from his residence to the river. The scenery around is of the most beautiful and picturesque character. The waters of the Hudson, dotted with the white canvas of innumerable boats skimming over its calm surface, convey to the eye the image of mingled peace and activity. The highlands adjacent rise up before the mind in their shaggy outlines with thoughts of the majesty of the Creator, rising as they do toward the blue heavens above them, their tops glistening in the sheen of the setting sun. From the upper windows of the tower, the scenery on every side is magnificent and subduing. On the stillness of a summer's eve, with its soft winds passing over and around us, the odor of a thousand different flowers returning the care of the Professor's hand by their sweet incense thrown up from their saucy, smiling lips, and the song of birds whistling in the consciousness of security from snare or murdering gun, who will blame us for feeling the words of the poet springing up within us?

"My only wish is this, that I might forever dwell  
Among such scenes as these, without the fear of death,  
Or touch of mortal decay."

Long may the Professor enjoy his home, spending his declining years in the serenity of a conscience un-reproaching, of a charity un-failing, of a simplicity of character unsullied by the memory of injury to any, and in the purity of a faith which sees beyond these scenes, these passing clouds, these flowers, so soon to fade, a habitation in another and more beautiful world than even this!

## Correspondence.

## The New Cleveland Offices.

CLEVELAND, O., Nov. 12, 1868.

EDITOR JOURNAL OF THE TELEGRAPH:

The removal of the offices of the Western Union Telegraph Company in this city from the rooms occupied by them so many years in the Waring block, to their present location, is an event worthy of notice. The old offices—amply sufficient in accommodation in 1856, at which time we first occupied them—grew more and more cramped and crowded as the years went on, compelling the taking of additional rooms now and again, until at last we were obliged to “flit.” September 6th, of the present year, saw the old premises desolate, and the new—chaos, but chaos in the condition of being rapidly reduced to order. At this writing, we occupy probably the most complete and perfectly arranged offices in the Western Union Telegraph Company’s western territory. They are in the National Bank building, an imposing fire-proof stone block, on the corner of Superior and Water streets, the business centre of the banking, insurance and general commercial business of Cleveland. The premises consist of a receiving room, in the corner basement, or street floor, a suite of three rooms on the second floor, occupied by the General Superintendent of the Central Division, the District Superintendent of the 5th District, Central Division, the General Agent of the Western Associated Press, the Superintendent of Repairs, and the Supply Agent of the Central Division. The operating and battery rooms are on the fourth floor.

The arrangement of the operating room is in all regards remarkably convenient, and the manner of laying the wires unique. The room is twenty-four feet in width by about eighty in length. Ranged along its middle, and occupying nearly its entire length, but leaving spacious passages between them and the side walls, are seven handsome operating tables. They resemble the “Buffalo pattern” of table, with certain differences. Each accommodates four instruments, being divided longitudinally by handsome plate glass panels, so as to equalize the light, and transversely by slight partitions of carved wood. Their material is ash, trimmed with black-walnut. Midway the room, on the west side, stands a fine sectional switch-board, six feet in width by seven in height, made by G. W. Shawk, projected two feet from the wall, and consequently perfectly easy of access at the back. To this the wires are brought from the windows by a very symmetrical arrangement of binding screws, &c., and are also connected with a full complement of lightning arresters, connected with very direct and sufficient ground wires. Opposite the switch-board stands the local battery closet. Under-running the operating table from end to end of the room, is a slightly raised platform, something under two inches in height, and connecting with this from switch-board to battery-closet, a similar one. In these, entirely concealed from sight, and lying in “slotted” supporters, held beyond the possibility of being crossed, are the office wires. Two minutes labor with a screw-driver will uncover them all, should necessity arise, but there seems scarcely a possibility of such necessity, unless to add to their number. The plan was original with Mr. Stumm, assistant manager, and the labor of carrying it out was his entirely. Conception and execution reflect credit upon him. Photographs of the operators, uniform in size and style, ornament the walls, among them two, whose originals we shall see no more, and whose names will sound pleasantly to the ears of many who read this, George Tame and Charlie Crary, who died here in 1865.

In the rear of the operating room is a large airy apartment, destined no doubt to be in the future a “way-wire” office, but at present used only as a storage room for those odds and ends that increase

and multiply so amazingly about a telegraph office. The main battery-room is on the same floor with the operating room, and separated from it only by a hall. It was specially fitted up for its present purpose when the building was erected, and is complete in its appointments, with a cement floor, gas, water, sinks, drainage, and a water-closet attached. The batteries are two in number, of 80 and 60 cups respectively, and from them are worked 31 wires of all classes. The Superintendent’s offices, before mentioned, connect with the operating rooms and receiving room by a common dummy, and independent speaking tubes. These are built in the wall, and work perfectly and smoothly. A telegraphic loop also connects them with the operating room.

The receiving room is moderately spacious, well lighted, and handsomely finished in grained oak. It has no features worthy of special notice, but is in a general way creditable to the Company. The entire building is glazed with large and very heavy English plate glass, and heated by Gold’s patent steam heating apparatus.

The force now attached to Cleveland office, may be summed up as follows: One manager; one day assistant do.; one night assistant do.; twenty-six operators; ten messengers; two battery men, and one repairer. The terms of service of some of these have been so protracted as to merit notice. That of the manager has reached nearly nineteen years; those of his two assistants nearly fourteen. Tommy Callaghan, our local battery man, has been here years enough to change a young man into a middle aged one, and sprinkle his beard plentifully with gray. He cannot stay too long, all agree. M.

Cleveland is in direct connection with 250 offices, and averages a daily service of 1,200 messages, and a daily income of about \$225. The circuits are divided as follows: 10 wires to Buffalo; 4 wires to Chicago; 3 wires to Detroit; 2 wires to Toledo; 2 wires to Cincinnati; 2 wires to Columbus; 3 wires to Pittsburgh; 1 wire to Oil Regions; 2 wires to Leavittsburg and Youngstown; 1 wire to Newburg; 1 wire to Berea.

The following are the officers and operators connected with the office:

General Superintendent—Anson Stager.  
Secretary—S. G. Lynch.  
Superintendent 5th District—E. P. Wright.  
Clerk—C. W. Douglass.  
General Manager—A. M. Vanduzer.  
Manager Operating Department—C. F. Stumm.  
Night Manager—E. T. Tindall.

## DAY OPERATORS.

S. B. Roberts, N. C. Griswold,  
W. H. Wallace, H. M. Harris,  
J. M. McKinstrey, A. Desson,  
Wm. A. Manning, R. M. Talbot,  
C. H. Rudd, C. H. Pond,  
H. G. Buckingham, A. U. Everts,  
George Bruner, W. H. Woodyatt,  
A. C. Ziemer, L. D. Morse,  
L. A. Summers, E. Dickenson.

## NIGHT OPERATORS.

F. A. Stumm, D. M’D. Hall,  
W. H. Eckman, O. W. Nash,  
J. C. Graham.  
Manager Depot Office—Geo. H. Burwell.  
Bookkeeper—H. A. Buell.  
Assistant—H. F. Douglass.  
Office Boy—Alexander Wilsey.

C. W. Storrs, for three or four years a telegraph operator in the Western Union office of this city, died last night of typhoid fever, at the age of twenty years. He was a young man of excellent character, of strictly correct habits, and during his residence in this city has endeared himself to all his associates and acquaintances, who deeply mourn his early death. He has been one of the most efficient and active members of the Good Templars organization in this city and State, and at the time of death was Deputy G. W. Chief Templar of Connecticut Lodge, No. 70, of this city, and District Secretary of the first district of this State, which embraces Hartford and Tolland Counties. *Hartford (Conn.) Courant, Nov. 17th.*

## The Right Spirit.

The correspondence which follows has the ring of former years. Labor then was a joy, and when called to stick it out until daylight, or give a disabled circuit a lift on a big pile, we used to regard it as excellent fun and took to it jollily. We recognize the same old names that used to make the wires merry with good cheer, and only wish we were back again at work we loved and tried to honor.

CINCINNATI, November 23d, 1868.

EDITOR JOURNAL OF THE TELEGRAPH:

On the night of the 20th inst., all the wires of the Union Company were torn down east of Altoona, Pa., by a land slide, depriving Cincinnati, St. Louis, and Louisville of their regular New York connection, and leaving a large amount of business to be transacted. The Lake Shore route being the only resource, Buffalo office was called into requisition to repeat the South-western business, and nobly responded, all the business being cleared up by midnight. On the 21st, the Pennsylvania wires still being out of order, Buffalo office was again called upon to repeat the vast amount of South-western business, and it was done with such promptness as to call forth the praise of all true telegraphers.

BUFFALO, November 21—4 P. M.

E. P. Wright, Superintendent:

We have in addition to regular work repeated the Pittsburgh and Cincinnati business to-day, exchanging over seven hundred (700) messages with New York before 4 A. M., and all clear. Everything gone through promptly.

TILLINGHAST.

In appreciation of the valuable services rendered by the Buffalo office, the following was sent by our chief operator:

CINCINNATI, November 21—4.04 P. M.

Hucker and Tillinghast, Buffalo:

The Cincinnati operators send their compliments to the Buffalo operators, with their thanks for the promptness and ability shown in getting off our business last night and to-day. When we can return the favor let us know.

STEVENS

BUFFALO, November 21—4.06 P. M.

Stevens, Cincinnati:

We thank you for your message. It is cheering to think that our efforts are appreciated. It is our custom to do business in a business-like manner, doing what is required of us cheerfully, being not afraid of work, only asking proper facilities, and anxious to be accounted profitable servants to our employers.

HUCKER & TILLINGHAST,  
On behalf of Buffalo operators.

NEW YORK, November 21.

N. Hucker, Buffalo:

For the very efficient manner in which our Western business yesterday and to-day has been handled, I think you and your office are entitled to a vote of thanks. I have noticed the same thing on several previous occasions.

A. S. BROWN.

Manager N. Y. Office.  
BUFFALO, November 21.

A. S. Brown, New York:

Your kind words of encouragement are duly appreciated by myself and employees of this office. My only wish is that you will always find us ready and willing to further the interests of the company.

N. HUCKER.

Mr. Ellison, chief operator of the Louisville, Ky., office, in his usual obliging way, offered to assist us with all the means in his power in opening communication with Baltimore, Washington and Philadelphia, by the way of Richmond, Va., and in fact, transmitted all our Eastern special despatches in ample time for publication in the afternoon papers. The facilities of the Western Union Company, thus incidentally exhibited, and the activity shown by its true and honest employees, seem deserving of public notice at your hands.

P. C. &amp; L.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 8,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per Annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address— JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, DECEMBER 1, 1868.

### Thanksgiving.

The preparation for our new volume comes most appropriately on the day of National Thanksgiving. In the quietude of its evening hour we pen these initial lines with emotions born of the thoughts which this anniversary of gratitude and turkey and enjoyment naturally bears. The year has been brim full of mercies. They have come trooping to us through every phase of sky, and in every quarter of the moon. On the snow-flake as on the sunbeam, on the rain as on the summer flowers, in dark tempestuous days as in the merry hours of rejoicing summer, fairy forms laden with gifts of hope, with apples of gold in pictures of silver, have made the year rich from its entrance to its close. They have come striking life's Horeb rocks making silver waters to issue from their rugged sides, and turned Mara's bitter pools to purity and sweetness. So we ate our turkey to-day with a grand sense of gladness, kissed our hand to all the world, and felt that it was a jolly thing to live. A little gladness in the heart makes the sunlight wondrously bright, and even through the nights of tempest reveals unseen stars which, above every cloud, still forever shine. We have always found that

"When gratitude o'erflows the swelling heart,  
And breathes in free and uncorrupted praise  
For benefits received: propitious heaven  
Takes such acknowledgement as fragrant incense,  
And doubles all its blessings."

Yet the year has had its sorrows, and to some of us the shadows have been long. Some sat down to the family feast to-day in silence and in inward tears. Vacant chairs are sad things to look on, and the silent faces on the wall tinge the grateful day with the shadows of passed joys never to return. Yet there never was a night so dark which did not lead to morning; never a grief so big which could not guide to greater joy. The star that trembles deepest in the wave, is the same star that shines highest in the sky.

Among the many good things which have blessed the year, we take great pleasure in knowing that the Telegraphers' Mutual Life Insurance Association has provided comfortable sums to the families of three of our associates who have died. In all these cases the money has been a great relief, and been received with gratitude. We trust none of its members will become weary of their self-assumed burdens. Let there be no flinching. Every death is a certificate of usefulness, and a badge of the craft's honor. The one dollar paid when a death is announced is a new bond of sympathy among the living, which will make life brighter and the heart better.

Our readers will observe a marked change in our appearance. Our dress throughout is new and beautiful, while the size of the paper has increased one third. This

will permit us to insert many miscellaneous articles which will render the JOURNAL more cheerful and welcome. We design to make it a pleasant companion to all who receive it. These long faces of ours, which hard work, and ill-nature, and worry about dividends, furrow with care's ugly autographs, need shortening. We design to try our hand at chin chucking as well as our more sober duties. Let everybody smile.

Now then to work. Let us enter the year gladly and hopefully. Let each man bear his burden patiently and keep his heart in sunniness. So shall labor bear its triumph, and the energy of mutual kindness, while divesting authority of its attrition, will give to toil the benediction of a common joy.

### Banquet to Professor Morse.

We are glad to see that a long delayed recognition of the services of Professor Morse to science and mankind is about to be given. The following letter, signed by many of the most distinguished of our citizens, shows the high character of the designed testimonial. Professor Morse is now in his 78th year, a youthful, genial, happy, christian gentleman. We hope the banquet will be a large and noble one.

NEW YORK, November 30, 1868.

SIR—Many of your countrymen and numerous personal friends desire to give a definite expression of the fact that this country is in full accord with European nations in acknowledging your title to the position of the father of Modern Telegraphs, and, at the same time, in a fitting manner, to welcome you to your home.

They, therefore, request that you will name a day on which you will favor them with your company at a public banquet.

With great respect, we remain,

Very truly your friends,

HAMILTON FISH,	JOHN J. CIBCO,
D. HUNTINGTON,	WILLIAM ORTON,
WILLIAM DENNISON,	PETER COOPER,
WILLIAM E. DODGE,	CYRUS W. FIELD,
WILLIAM ADAMS,	JOHN T. HOFFMAN,
A. A. LOWE,	A. G. CURTIN,
WILSON G. HUNT,	EDWARDS S. SANFORD,
MORRIS K. JESUP,	B. R. MCALPINE,
O. H. PALMER,	MARSHALL LEFFERTS,
HENRY PETERS GRAY,	I. F. KENSSETT,
LOUIS LONG,	GEORGE A. BAKER,
T. ADDISON RICHARDS,	WM. PAGE,
EDWIN WHITE,	C. P. CRANCE,
T. L. A. WARD,	W. WHITTREDGE,
L. HOLBROOK,	GEO. S. COE,
JOSIAH M. FISK,	JOHN HORNES,
J. W. CLENDENIN,	ALEX. HAMILTON, Jr.,
CAMBRIDGE LIVINGSTON,	JAMES A. SCRYMSEER, and
many others.	

Prof. S. F. B. MORSE, L.L.D.,

New York.

We are happy to be able to state that the banquet will take place on Wednesday evening, December 30th, 1868, Mr. Morse having informally signified that date as agreeable to him.

### International Ocean Telegraph Company.

The annual meeting of this young and enterprising Company was held yesterday at their office in New York, when the following gentlemen were elected Directors for the ensuing year:

WM. F. SMITH,	ALEX. HAMILTON, Jr.,
D. H. HAIGHT,	E. S. SANFORD,
ISRAEL CORSE,	ROBT. J. LIVINGSTON,
W. T. BLODGET,	JAS. A. SCRYMSEER,
O. K. KING,	T. BAILEY MYERS,
JAS. T. SANFORD,	JNO. JACOB ASTOR,
WM. G. FARGO.	

At a meeting of the Board of Directors, December 2d, the following officers were elected:

W. F. SMITH, President,  
ALEX. HAMILTON, Jr., Vice-President.  
WM. G. FARGO, Sec. and Treasurer.

The affairs of this Company are in prime condition, and the connections so soon to be completed with the West India Islands, for which handsome subsidies have been granted, render it one of the most valuable and successful of our telegraphic organizations.

### OFFICIAL STATEMENT.

Western Union Telegraph Company.

OCTOBER, 1868.

Gross Receipts.....	\$680,311 81
Current Expenses.....	410,604 17
Net Profit.....	\$269,707 64

Increase of receipts compared with the corresponding month of 1867, \$51,475.07.

### Declaration of Dividend.

At the semi-annual meeting of the Board of Directors of the Western Union Telegraph Company, held December 2d, a dividend of two per cent. was declared, payable January 20th, 1869. The books of transfer will close December 21.

The affairs of the Company were fully represented, and were found highly satisfactory and assuring. About four hundred new offices have been opened during the year, and at least 5,000 miles of wire added to the facilities of the Company. In our next some interesting statistics will probably be given.

### The Postmaster General's Report.

We are informed that the Postmaster General has recommended Government to go into the telegraph business. Mr. Hubbard, of Boston, is aiding in the same direction. Both cite European experience as in its favor. The charm of Government authority is too much for both, and because the empires of the old world have taken by the sleepless instinct of self-preservation the channels of communication from the people, it is recommended to the government of a free nation to do the same.

We cannot enter into the argument at present. In our next issue we will refer to it. The scheme will not succeed. The popular instinct is against it. We trust the telegraph will be left where it is, a creation of the people, a magnificent private enterprise.

### Ownership of Dispatches.

When a message has been handed to a telegraph office and transmitted, it becomes thenceforth the property of the company. The writer cannot compel its return to him, and a demand to do so must be courteously refused. Should the sender of a message desire it to be shown to him, the request should be granted, but the message must never be taken from the office. It must remain in the telegraph company's hands, to be filed carefully, preserved from the inspection of any one, and the subject of it rigorously excluded from even office conversation.

### Telegraph Institutes.

There can be no reason for opposing any proper medium for the impartation of any desirable knowledge. In the telegraphic art especially, with the lines ever increasing, with new offices ever opening, with other fields of more enterprising labor ever presenting themselves to spirited young men now connected with the business, there should be reasonable facilities given for the education of others. Only let no false promises be made. Let young men and women learn as a possible means of support in an honorable business, and qualify themselves as well as they can for telegraphic labor. We do not believe that the opportunities given in the various institutes will injure the craft, unless under such unscrupulous management as that which at Sandusky, O., cast all such institutions, for a time, under suspicion.

In New York and elsewhere, there are institutes where the art may be learned as perfectly as is possible outside actual employment in an office. We have spoken of the Manhattan Institute, under Parker Spring & Co. The commercial colleges of Stratton and others teach the art. We are also advised of the school of Mr. T. R. Sloane, No. 82 Fifth avenue, who bears the testimonials of several well known and experienced men, and who appears to conduct his institution carefully and honorably. The students at these institutions may all be needed—some in telegraph offices and some in connection with more private lines, many of which are yet to be constructed. Only let no pledges of employment be given or improper hopes excited.

## The Telegraph.

BY WILLIAM C. RICHARDS.

Mark ye those graceful curves that seem  
Like lines of beauty on the sky?  
Upon that mystic path can't deem  
That busy thoughts each moment fly?  
'Tis even so; for man doth tame  
The forked lightnings by his skill,  
And proudly bids their tongues of flame  
Be vocal with his thoughts at will.

A thousand miles that line may reach,  
Yet Thought, in scarce a moment's space,  
Mocking the tardiness of speech,  
Has run the far, mysterious race;  
And deeds to distant lands are told,  
Ere yet the echo of their fame  
Athwart their place of birth has rolled,  
Or they have e'en received a name!

Behold, upon that rushing train  
A murderer flies the place of guilt,  
And vainly hopes to hide the stain  
Of human blood his hands have spilt;  
For through the air the tidings speed,  
And Justice warned, as if from God,  
Stands ready to avenge the deed,  
And smites her victim with her rod.

From the cold regions of the North,  
To lands that smile 'neath Southern skies,  
The winged messages go forth,  
And men behold, with deep surprise,  
The swift pulsations of the wires,  
That to the tutored vision show,  
As moved by the electric fires,  
Tidings, perchance, of weal or woe.

Oh! wondrous age, when man may greet  
His brother, whom he cannot see,  
And distant lands together meet  
In converse unrestrained and free;  
When crime can find no refuge spot  
Where its dark tale hath not been told;  
When time and space are both forgot,  
Or numbered with the things of old!

And ere a century shall roll  
Its burden on the mighty past,  
Around the globe, from pole to pole,  
Science her magic chains shall cast.  
Then "thought's highway" from sea to sea,  
And o'er their trackless wastes shall reach,  
'Till all the human race shall be  
One in a universal speech!

## A Happy Superintendent.

Among our marriage notices will be found that of Geo. W. Trabue, Esq., the well-known Superintendent of the 8th Southern District. We wish him abundant joy in his new relations. He is one of the most genial of men, and takes to the telegraph as a duck takes to water.

Indeed it seems to be an exceedingly happy time among superintendents and managers generally. Presentations, and weddings, and complimentary messages, and good will, glow all around us. The gifts to our esteemed friends E. D. L. Sweet and Superintendent Brenner we feel to have been richly deserved and delicately given. The responses of both prove that other men than traveling statesmen can return felicitously the compliments which are thus so worthily bestowed.

## Numbers 2 and 3.

Parties who have at various times ordered back numbers of the first volume have usually had all sent to them except Nos. 2 and 3. These are now being reprinted, and will be furnished to all subscribers who desire them to complete their sets without charge.

In commencing the first volume, we were, as we acknowledged, unskilled in the art of either editing or publishing. One of our errors has been in numbering each paper separately instead of as parts of a volume. Thus an index is made difficult. We shall, however, issue a title page and running index with as little delay as possible and furnish it to subscribers.

SIR CHARLES BRIGHT, the English electrician, is expected to-day in the China.

THE International Ocean Cable Company have chartered the steamship New England to pick up the lost Cuban cable, which it is hoped can now be easily accomplished.

## To Our Friends.

The increased size of the JOURNAL renders it exceedingly cheap, while the variety of its contents must make it desirable as a family paper. We ask our friends to increase its circulation by all means in their power. Is it too much to request every office to which it comes to obtain one new subscriber? We would be glad to have every operator subscribe for a copy for his or her personal use and preservation. It will be our endeavor to make it useful and interesting to them all.

## The Fire Alarm Telegraph in Troy.

The Troy Common Council have directed the Mayor to enter into a contract with Mr. Gamewell to put up his Fire Alarm Telegraph in that city.

## Agency of Bishop's Submarine Telegraph Cables.

As we have before stated, the agency of Samuel C. Bishop's well-known submarine cables and other telegraph manufactures, is now given to the houses of L. G. Tillotson & Co., New York, and Bliss, Tillotson & Co., Chicago, Ill.—a most sensible arrangement, and which must benefit both parties and the rest of mankind. We have room for no more at present.—See advertisement on page 9.

## Our Printer.

JOHN POLHEMUS, 102 Nassau street, New York, prints our paper, and we commend him to all requiring printing of any kind as a prompt, tasteful, energetic, practical printer. He is to be found always near his press and among his men. For all who require unusual dispatch, neat, well executed work, there is no man more deserving of patronage, and his foreman and men are like the principal. There is no neater paper than the JOURNAL leaves this great city.

## A New Cable Across the Mississippi.

A new cable has been laid across the Mississippi, connecting the Balize telegraph office in New Orleans by the way of Algiers with the passes at the mouth of the river. The work was performed by Mr. Moke, under the superintendence of Mr. John K. Mingle, the steam tug Ella Wood being used for reeling out the cable, and proved a perfect success. The cable is one of Bishop's, of New York, manufacture, and is pronounced by competent judges to be one of the best ever made. The cable is only seven-eighths of an inch in diameter, and the conductor, which is single, is composed of seven fine copper wires. The old Father of Waters seems to have a particular spite against the tamers of Jupiter Tonans, but we hope this new cable will not have to be replaced for years. About half a dozen cables—among them the "Red Sea" cable—have been lost or destroyed by the action of the current of the river here at high water.

It is only simple justice to say that no finer cables are made than those of Mr. Bishop, of whom Messrs. L. G. Tillotson & Co., 11 Dey street, are now the recognized agents, and we are sorry that an American company ever feels it necessary to go beyond its own nation to provide cables which can be made with equal skill in our own metropolis, by our own enterprising citizens, and on terms which remove the temptation to purchase elsewhere.

THE suits brought by the Atlantic and Pacific Telegraph Company against Messrs. Daniel L. Harris, Gurdon Bill, George M. Atwater and James D. Brewer of this city, to compel payment of their subscriptions to the stock of that company, have been abandoned. The ground of the defendants' refusal to pay was that the scheme was a swindle.—*Springfield (Mass.) Republican*.

We have received two communications signed "Martha" referring to a controversy we have not read, and do not understand. The author's name not being given, and no point made which seems of value, we have been compelled to put Martha's communication in the basket.

Now that Mr. Benton's Key is in so good hands as the Chesters, of Philadelphia, we hope its merits may be seen and recompensed.

## Presentation.

Some weeks since the residence of the worthy Superintendent of the Third Southern District, J. A. Brenner, Esq., was entered by burglars, who, in addition to a few hundred dollars and other valuables, deprived him of his watch and chain. When this became known, the manager and operators of the Augusta office proposed to the employees of other offices in the Third District, to present Mr. Brenner with a gold watch and chain. The proposition was readily seconded, the money subscribed and the watch and chain purchased.

Tuesday night, about 11 o'clock, a party of gentlemen applied for admittance to the residence of Mr. Brenner. Mr. Brenner appeared on the scene somewhat alarmed at first, evidently smarting under the remembrance of his late misfortune, but the smiling countenance and friendly shake of the hand which greeted him from one and all assured him that the intentions of the party were entirely pacific.

Mr. John M. Crowley, manager of the Augusta office, acted as spokesman for the party. He said:

MR. BRENNER: The pleasing duty devolves upon me, in behalf of the gentlemen of your district, to present you with this watch and chain, as a slight testimonial of our appreciation of you as an efficient officer of the Company, as well as a friend and worthy gentleman. This evidence of esteem comes from the employees of the Third District, and you would feel no little flattered were you to hear the expressions of regard for yourself that have accompanied the remittances to me from the various offices of the district in furtherance of this object—all, with one accord, wishing you much health, happiness and prosperity, and expressing the hope that they may always be so fortunate as to be directed, in the discharge of their duties, by so kind, competent and impartial an administrative officer.

After recovering from this pleasant surprise, Mr. Brenner replied as follows:

GENTLEMEN: It is with feelings of surprise and gratitude that I acknowledge this gift of a gold watch and chain, as a testimonial of your kindness and regard. Accompanied, as it is, with the assurance that it is an evidence of your approval of my official conduct, it gives that sanction to my discharge of duty in the past, which is so flattering to all who are placed in positions of authority over others.

It has sometimes, very seldom, however, I am glad to say, been necessary for me, as your Superintendent, to administer rules which have borne unpleasantly upon some. In every instance, I can assure you, it has been as painful to me as to the sufferer, and while duty allowed no alternative, it would have been most grateful to my feelings to have been spared the requirement.

I have always tried to secure the friendship and goodwill of those with whom I have been associated, whether officially or otherwise. If I have failed in any instance, it has been the fault of the head, not the heart.

To find that my course has met with your approbation is eminently gratifying, as an assurance that you distinguish the person from the officer, and appreciating fully the feelings of the one, you commend the conduct of the other—that you reciprocate the personal friendship, and do not permit official relations in any respect to impede its pleasant course.

Allow me again to thank you for this handsome gift. I shall ever prize it as a memento of each personally, and wherever our lots may be cast, it will ever bring to mind our many pleasant associations; and in all our official intercourse, it shall serve as a monitor that he who rules, while he uses firmness in the execution of rules, should couple the same with kindness and gentleness of manner.

I accept it as an index of the faithful discharge of our respective official duties in the future, and as a chronicler of the hours and days and years to come, to be spent in the bonds of that mutual sympathy and kindness which have united us in the past.

The watch and chain cost \$220. The watch is of the American style and make, eighteen carat gold, double case, full jeweled, Appleton & Tracy movement, No. 311,179, bearing on the case this inscription: "Presented to J. A. Brenner, Sup't, by the employees of the Third District, Western Union Telegraph Company, November, 1868."

## The Fire Alarm Telegraph in Albany.

Quite an extensive addition to the Fire Alarm Telegraph of Albany is now in course of construction under the supervision of Superintendent A. L. Whipple. Thirty additional boxes are being put in circuit.

ON "earthquake day" in San Francisco, two thousand telegraphic messages were sent East.

**A Happy Family.**

PHILADELPHIA, Nov. 16, 1868.

EDITOR JOURNAL OF THE TELEGRAPH:

Election is over; we are not quite so driven with business, and I thought you might be pleased to hear from us in this quiet "village."

The fraternity here think that the arrangements for distributing the election returns were most complete. Everything worked admirably, and every demand was fully met. The "Press" engaged a wire for itself, exclusively, and was delighted with the extraordinary facility with which the news was served. Probably no other paper in the country provided itself with equal facilities. In a handsome editorial, Superintendent Bates' services were fully and justly acknowledged. So, both sides were pleased; the "Press," in prompt returns from its special correspondents, and the telegraph company reaping a corresponding reward in the shape of tolls. This shows well for the enterprise of both. I believe this is the first newspaper that has made such a venture in these parts, except the *Evening Telegraph*, during the Wigwam excitement a couple of years since, which had one of Bentley's wires run into its editorial room; but the proceeding came to so abrupt a termination, that the value of the arrangement was lost. The Union League has its headquarters about a mile from the general telegraph office, and it has had two of Bentley's wires for two or three years past on all important occasions. Mr. Bentley's wires, from the League alone on two nights, handled about five hundred dollars worth of business besides other local business. The Quaker wires can talk.

We had an abundant lunch served during election night, and all were in good spirits. How could we feel otherwise than happy, surrounded as we were with plenty, and having in our midst, working as energetically as any subordinate, both our Superintendent and Manager, Mr. Merrihew, true men, both of them.

I do not believe there is a happier telegraphic family in these United States than ours, and one of the strongest evidences of this is the fact that there are so many of the old employees retaining their positions here year after year. We can afford, therefore, to look on and read at our leisure, although with deep regret, the bickerings and complaints of those who are disposed to make public their imaginary troubles. Operators, and employees generally, would serve our common interests better if they would cease widening the distance between the employer and employed.

It would be worth the while of any one who has not visited this office within a year or so to visit it now. If the visitor does not admit a vast improvement, and mark the hand of skillful and methodizing executive capacity which has brought order out of chaos, it will be strange indeed. AMICUS.

**Another Happy Family.**

BUFFALO, November 23, 1868.

Gen. Anson Stager, General Superintendent:

DEAR SIR—As your attention has been called to correspondence with Cincinnati office I inclose herewith messages of similar nature with New York office. The cheering words received from New York and Cincinnati offices, showing that our efforts to facilitate business are appreciated, will stimulate us to increased exertions whenever we are called upon. You may rest assured that whatever Buffalo office can do to promote the company's interests will be done cheerfully and as promptly as our facilities will admit.

The annexed statement of Saturday's work may be interesting to you:

Messages sent to and received from New York numbered,	757
Messages sent to and received from Cincinnati,	459
Messages sent to and received from Pittsburg,	222
Messages sent to and received from Chicago,	236
Total,	1,674

Total number of messages sent and received 2,116, office messages not included.

In addition to this the four regular reports for State press, noon report for Western press, and two specials of about 600 words were received. To accomplish the work named sixteen operators (myself and assistant included in the number) were engaged, giving an average of 132½ messages to each operator, reports, &c., not included.

November 10 the following was our numbers with two offices only, viz:

Sent to and received from New York,	862
Sent to and received from Chicago,	559

Total, 1,421

Repeated messages for other offices about 450, in addition to the above.

Yours very respectfully,  
N. HUCKER.

**Personal.**

Richard O'Brien, Assistant Superintendent, Eighth District, Easton, Pa., has been appointed Superintendent of the Telegraph on the Morris & Essex R. R., in connection with his present duties.

Under the superintendence of T. B. A. David, Esq., of the Fourth District, Central Division, a new line of from two to four wires has just been completed between Altoona, Pa., and Pittsburg, via the Pennsylvania Central and West Pennsylvania Railroad. Increase of business with the West has demanded this new structure. The insulators used are Brooks' last enclosed bottle arrangement, and the line is represented as working with admirable clearness.

Mr. T. Wells, of London, joint traffic accountant of the Atlantic and Anglo-American Telegraph Companies, is now in New York on business connected with his position. Mr. Wells returns to London on the steamer of the 9th instant.

We have had a flying visit from Gen. Stager, who has returned to his immense western field. He will be established in his new home in Chicago early in January. Antelope and prairie chickens seem to agree with him. He don't look much like the Anson Stager of 1845, three feet high and twelve inches round.

By letters from M. Romero, the Treasurer of the Mexican Republic, we learn that the telegraph lines from Mexico to Matamoras are in process of rapid construction, and will soon be completed.

Geo. B. Strong, late of Skaneateles, N. Y., has charge of the A. & P. office recently opened in Saratoga Springs.

Thos. Stewart, Jr., who has been subbing in Plattsburg, N. Y., for several weeks past, has been relieved and is now at his home in Vermont.

John Carroll, late of the Peoples line of Steamers office, Albany, has accepted a position in the Albany Fire Alarm Telegraph Office.

J. A. Wright, of New Jersey, who has been in the employ of the A. & P. Co. at Albany for a short time past, has resigned and accepted the position of Superintendent of Construction on the P. & A. line.

W. H. Gay has been transferred from the A. & P. Albany office to the Syracuse office, same company.

D. J. Harrigan now has charge of the operating department Albany office A. & P. Co.

The West Tennessee *Whig* writes a very complimentary notice of Mr. J. R. Coburn, Manager of the Western Union telegraph office at Jackson, in connection with the removal of that office to a more eligible location. We have no doubt the compliment is deserved.

SUBSCRIBERS will find the splendid likeness of Prof. Morse inside their papers to preserve from injury in the mail. It is designed as a *frontispiece* to the new volume.

AT the close of 1867 there were 13,390 miles of telegraph line in British India, and 172 stations. The system is in the hands of the government except where licenses have been given to railroad companies.

**Death of J. T. Winne.**

We regret to have to record the death of John T. Winne, a member of the Telegraphers' Mutual Life Insurance Association, which occurred in Troy, N. Y., November 23d. He has left the fund due to him from the Association to pay funeral expenses, and the remainder to a young brother and sister to enable them to be educated. Without this fund the expenses of the funeral would have become a matter of public charity. To the two little ones who are thus to be educated by the funds so provided, how precious must be the memory of a brother who has thus cared for them, and how it hallows the Association's work. Brothers, don't weary in your mission. Even as an ordinary charity, bear your assessments joyfully.

"The deeds of charity which we have done,  
Shall stay forever with us; and that wealth alone  
Which we have so bestowed, we keep;  
The other is not ours."

We hope the members of the Association will, without waiting further notice, immediately remit one dollar to Mr. D. R. Downer, Secretary, Box 3,393, 145 Broadway, New York. Acknowledgments will be made in the *JOURNAL* as before.

In a recent lecture, C. W. Siemens, F. R. S., spoke of the remarkable effect of tungsten upon steel, in increasing its power of retaining magnetism when hardened. A horse-shoe magnet of ordinary steel, weighing two pounds, is considered of good quality when it bears seven times its own weight. The famous Haarlem magnet supports *thirteen* times its own weight. But Mr. Siemens has succeeded in producing a similar horse-shoe magnet of tungsten steel, which will carry *twenty* times its own weight suspended from its armature.

**Born.**

In Providence, on Sunday, 15th inst., a son to Mr. Walter P. Phillips, night manager of the Western Union office in that city.

NOTE.—The young gentleman's name is Irving Phillips, Esq., and his good father is the happiest man in Rhode Island. The note announcing the arrival is a perfect explosion of parental delight.

**Married.**

At the residence of Mrs. Sophia W. Horton, near Nashville, on the 18th inst., by the Rev. Dr. Lapeley, Geo. W. Trabue, of Nashville, Tenn., to Miss Ellen Dunn, daughter of Col. W. D. Dunn, of Mobile, Ala.

On the 10th of November, by the Rev. J. M. Simmons, at the M. E. Church in Quitman, Georgia, Mr. John S. Haines of the Western Union Company's office at Quitman, to Miss Allah M. Brooks of the same place.

In Springfield, Mass., Nov. 18, at the residence of the bride's father, Henry Denver, operator of the Western Union Telegraph Company, to Emily C., daughter of Henry Gray, late superintendent of the Western Railroad.

In Brattleboro', Vermont, on Saturday, October 17, 1868, Mr. Lewis E. Badlerick, operator Western Union office, Fitchburg, Mass., to Miss Emma A. Chamberlin, of Oakdale, Mass., daughter of J. Chamberlin, Esq.

At Schenectady, N. Y., Nov. 19th, by the Rev. Denis Waterman, W. A. C. Graves, Manager of the New York Central telegraph office, Albany, to Helen M. Clark, of Schenectady.

On the 17th inst., at the bride's home, by the Rev. John Hewitt, Rector of St. John's Episcopal Church, Mr. William Powers, of Altoona, to Miss Mary C. Stewart, of Huntingdon.

**Died.**

In Albany, on Monday, Nov. 23d, of consumption, John T. Winne, late of the A. & P. telegraph office, Troy, N. Y., aged 21 years.

In Hickman, Ky., of brain fever, on Monday, October 19, 1868, at 2 o'clock, A. M., Herbert Howard, aged 21 years.

The subject of this article was a young man of the most exemplary character, and had a warm, generous, noble heart. We never knew him to be guilty of an unworthy action. In business he was prompt, reliable and responsible; his habits, always industrious, temperate and moral. For two years has been the trusted agent of the Western Union Telegraph Company and of the N. & N. W. R. R. His remains were conveyed to Blandville, in this State, and were interred with full Masonic honors by the Blandville lodge.

The afflicted family have the profound sympathy of the community in their sad bereavement.—*Hickman (Ky.) Courier.*

## TARIFF BUREAU.

## Semi-Monthly Circular.

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York,  
DECEMBER 1st, 1888.

To all Offices on W. U. Lines:

The following changes have occurred since November 16, the date of the last tariff order. Please note them in your tariff book:

## NEW OFFICES.

Alma, O., tariff same as Belmore, O.  
Bellefield, Va., tariff same as Weldon, N. C.  
Burlington, Ind., tariff same as Rushville, Ind.  
Camden, Mo., tariff 5c. more than Carrollton, Mo.  
Ft. Riley, Ks., tariff same as Junction City, Ks.  
Kinderhook, N. Y., tariff same as Chatham 4 Corners, N. Y.  
Stoney Creek, Va., tariff same as Petersburg, Va.

## OFFICES OPENED ON OTHER LINES.

Tunkhannock, Pa., tariff 50 and 4 from Mauch Chunk. Check Mauch Chunk.

## OFFICES CLOSED.

Lewis, Iowa, Bentley Springs, Md., Macedon, N. Y., Meteghan, N. S., and Chatham, N. J.

OFFICES HAVING "SPECIAL SHEET A" will check Enterprise, Pleasantville, Titusville, Miller Farm, Pioneer Farm, Boyd Farm, Shamburg, Tarr Farm, Storey Farm, Petroleum Centre, Rouseville, Pit Hole, Oil City, Reno, Franklin, Brady's Bend, Scrub Grass, Kittanning, Pa., as follows:

From offices North and West of Cleveland, 75c. more than "special rate" to Cleveland.

From offices East of Buffalo and North and East of New York City, 75c. more than "special rate" to Buffalo.

From offices between Cleveland and Buffalo, 75c.

From all others West of New York City, sending business for the "oil regions" via Pittsburgh, 55c. more than "special rate" to Pittsburgh.

From offices in Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecticut, \$1.00 more than "special rate" to New York City.

These rates will go into effect December 7.

## GENERAL INFORMATION.

On and after December 1st the name of Bridgeport, Wayne Co., O., will be Burbank, O.

Business for Bentley Springs, Md., will hereafter be mailed at Baltimore, Md., and business for Chatham, N. J., at Madison, N. J.

The following changes in tariff to offices of the Montreal Telegraph Line have been made:

Falmouth, Me., Yarmouth, Me., New Gloucester, Me., Craig's Mills, or Oxford, Me., Mechanics Falls, Me., South Paris, Me., West Paris, Me., Bryant's Pond, Me.,	} 40 and 3 from Portland, Me. Check Portland.
--	---

Bethel, Me., Gorham, N. H., Berlin Falls, N. H., West Milan, N. H., North Stratford, N. H., Island Pond, Vt., Norton Mills, Vt., Boundary Line, Vt.,	} 50 and 4 from Portland, Me. Check Portland.
---	---

Derby Line, Vt., 10 and 1 from Stanstead, C. E. Check Stanstead.

NOTE.—All Managers are requested to report from time to time to their District Superintendents what appear to them to be inconsistencies in the rates from their offices previously existing, or caused by the semi-monthly changes herein announced. These reports after examination should be forwarded directly to the Tariff Bureau, addressed Gen. Marshall Lefferts.

WILLIAM ORTON, PRESIDENT.

## Little Things.

Springs are little things, but they are sources of large streams; a helm is a little thing, but it governs the course of a ship; a bridle-bit is a little thing, but see its use and powers; nails and pegs are little things, but they hold the parts of a large building together; a word, a look, a smile, a frown, are all little things, but powerful for good or evil. Think of this, and mind the little things. Pay that little debt; if a promise, redeem it; if it is a shilling, hand it over. You know not what important events hang upon it. Keep your word sacred; keep it to the children—they will mark it sooner than any one else, and the effect will probably be as lasting as life. Mind the little things.

## New Galvanic Pile.

A new galvanic pile has been constructed, with chloride of silver for the negative element, by M. M. Warren de la Rue and Hugo Muller. This pile, though of exceedingly small dimensions, is extremely powerful. It consists of a zinc rod, which need not be amalgamated, and of a thin silver wire coated with a certain quantity of chloride of silver, applied to it in a state of fusion. This is the negative, the zinc the positive element; the whole apparatus is not three inches high. The liquid used is a saturated solution of common salt. With ten couples, constructed as above, acidulated water will be rapidly decomposed. While the apparatus is working, the solution of salt becomes gradually charged with chloride of zinc, which only serves to increase the power of the pile; but care must be taken to change the solution as soon as metallic zinc makes its appearance on the negative element.

## Electric Organs.

"We hardly exaggerate in saying that an organist who has never heard his instrument played by other hands has never heard it at all. The reason is as obvious as that a man who only looks at a picture with his nose to the canvas cannot know much about its beauties. Many attempts have been made to remedy these defects. But the evil defied all attempts at removal till the very recent day when Mr. Barker (of 'pneumatic-action' fame) applied the electric spark. Now it matters not where the organist sits. In point of fact he may put his key-board and pedal-frame on wheels, splice on a sufficient length of cable, shift his battery, and have a fresh place every Sunday if it pleases him. Wherever he may be he has complete command over his instrument. We need hardly say that the advantage thus gained secures other desirable results. The abominable 'organ chambers,' now so common, in which instruments pleasant to see and hear are boxed up till they can be heard but imperfectly and scarcely seen at all, have not a shadow of excuse, now that the organist is independent of his organ's position. One part of the instrument might be erected in the chancel and another at the opposite end of the building; or it might be divided, like the choir it leads, into *Decanus* and *Cantor*; or a portion might be built high up in the roof—anywhere, in fact, according to the exigencies of the case. Again in concert-halls the player will now be able to sit near and facing his conductor, thus rendering unnecessary the effort of gazing into a constantly bedimmed mirror.

"The electric organ is an accomplished fact, and a performer—shade of Jubal, that such a thing should be—has discoursed sweet music upon it, *through five miles of wire!* We hear that Mr. Barker has erected one of forty-two stops in the Parisian Church of St. Augustine, and another near Marseilles; while, in London, the Messrs. Bryceson (who represent the patentee in England) have built a third for the use of Her Majesty's Opera. Of the first two we can say nothing, while, with regard to the last, it should be quite enough to state that it gives entire satisfaction to Mr. Pittman, the eminent organist at Drury Lane. A favorable verdict from such an authority is conclusive as to the merits of the invention.

"Messrs. Bryceson's instrument is but the swell (with pedal) of a large one not yet completed. It has, consequently, only a single row of keys placed at one side of the orchestra. The batteries are beneath the floor, where also the cable runs on its way to the organ, which is built in the 'flies' on the O. P. side. This cable consists of as many insulated wires as there are notes in the registers. As soon as the key in connection with either of these is touched, the electric current is complete, a magnet becomes excited, the corresponding pallet is opened

and the pipe speaks. We need not say that this series of operations is instantaneous, and it will readily be understood that the touch required is the lightest possible. With regard to the latter point we can conceive no greater luxury for an organist than to play upon an electric instrument after laboring at one of the ordinary kind. To what extent this enlarges the capacity of the instrument will at once be recognized. But the foregoing is not all the mechanical advantage gained. Both the swell pedal and stops work by the same means and with the same ease, thus securing to the performer the maximum of comfort. In point of fact there is not a mechanical difficulty connected with the instrument that electricity does not at once set aside."

## SPECIAL NOTICE.

L. G. TILLOTSON & CO.,

11 DEY STREET, NEW YORK,

AND

BLISS, TILLOTSON & CO.,

171 SOUTH CLARK STREET, CHICAGO, ILL.,

Respectfully inform their customers, and all parties purchasing

TELEGRAPH AND ELECTRIC MATERIALS,

that they have been appointed by the

BISHOP GUTTA PERCHA COMPANY, OF NEW YORK,

General Agents for the sale of any articles manufactured by them

FOR TELEGRAPHIC AND ELECTRICAL USE.

They are now prepared to fill promptly any orders for goods on hand, or to be manufactured, at the Company's prices in New York.

The long experience of this Company (and that of Mr. SAMUEL C. BISHOP, its immediate predecessor) in the manufacture of

PURE GUTTA PERCHA GOODS,

and the reputation they have gained and enjoy for the superior quality and perfection of manufacture of their

SUBMARINE TELEGRAPH CABLES

AND

INSULATED WIRES,

of various kinds, insulated with pure Gutta Percha, renders this arrangement a very important one for our numerous patrons throughout the country, and we confidently recommend these goods to their especial notice as being fully equal, if not superior, to any other in use.

The principal articles manufactured and offered for sale are

SUBMARINE TELEGRAPH CABLES,

(Any size required.)

Gutta Percha Covered Telegraph Office Wires, in great variety of size and style.

Subterranean Wires, covered with Gutta Percha and Lead outside, various sizes.

Subterranean Wires with Gutta Percha and braided fibre, and Bishop's Patent Compound outside.

Subterranean Wires, with Fibre and Bishop's Patent Compound outside.

Pole Line Cordage, with Fibre and Bishop's Patent Compound outside.

Bridge's Patent Electric Cordage.

Bridge's Patent Double Covered Cordage.

BISHOP'S PATENT COMPOUND WIRE

for out-door use and office connections.

INSULATED WIRES,

with two Conductors, both plain and with braid outside, and a great variety of other kinds made to order.

Cotton and Silk-Covered Wires, both twist and braided.

This arrangement with the Bishop Gutta Percha Company, together with our own extensive Manufactory in New York, and our great variety of Telegraph Material in stock, fully establish our claim that our stores are the depots of telegraph supplies in this country.

## FREY'S SELF-CLOSING TELEGRAPH KEY.

"A perfect, simple, homogenous, trunionless, self-closing key."—*Journal of the Telegraph.* By changing the points of the Receiving Magnet, the local batteries are kept from action, except when in actual use, and the sounder read in the usual manner. The Spring is made of the best spring wire; its elasticity adjustable. A perfect self-closer; the contacts are securely made, entirely independent of the manipulator. Right of manufacture for sale.

JOS. J. B. FREY, INVENTOR,  
Box 4,820, New York City

## PRESENTATION.

**The Retirement of Superintendent Sweet from the Western Union Telegraph Company.**

Some twenty years ago, Mr. E. D. L. Sweet, then a young man of twenty-four, commenced the business of telegraphing while the science was comparatively in its infancy. The details of the profession he had chosen he seemed to acquire by intuition, and, by his devotion to his business, his industry and strict integrity, as well as marked administrative ability, he rose rapidly, and soon obtained a high position, and has, since that time, been prominently identified with the rapidly growing enterprise of telegraphing. To but few men in the country does the business, with the vast proportions it has now attained, owe more than to Mr. Sweet. At the time of the consolidation of the Illinois and Mississippi and the Western Union Telegraph companies, he held the position of general superintendent of the former, and was then appointed to the superintendency of the Thirteenth district of the new company. While his success was so marked in this respect, perhaps no man connected with the company ever attained so general a personal popularity, particularly among the employees under his immediate direction, as the late superintendent of the Thirteenth district. An illustration of the pleasant relations between him and those holding subordinate positions under him is furnished by Mr. Dickey in his presentation speech, in the statement that from the five hundred employees under him only one resignation had occurred during the year. It can, therefore, easily be imagined that his resignation, which was sent in to take effect on the 1st of July last, was received with deep regret. His decision was final, however, and on the day mentioned he retired to assume the financial agency of the Young Men's Christian association, and to engage in private enterprises.

Soon after his retirement a committee was appointed to solicit subscriptions from the employees of the Thirteenth district, for the purpose of presenting him with a suitable testimonial of the esteem felt for him by all. The task proved an easy one, all being solicitous of contributing, and the necessary amount was soon raised. The birthday anniversary of Mr. Sweet was chosen as a most appropriate occasion for the presentation. It has long been the habit of Mr. Sweet to celebrate these anniversaries by a reunion of his relatives and personal friends, and, by letting Mrs. Sweet into the secret, the matter was easily arranged so as to give the recipient of the testimonial a complete surprise. The articles to be presented were surreptitiously conveyed into the house and placed upon a table in a boudoir at the back of the parlor, and concealed from view by a curtain.

At the appointed time the guests assembled to the number of nearly one hundred ladies and gentlemen, all personal friends and attaches of the telegraph company, when Mr. Sweet and his lady were brought facing the boudoir, and the curtain was removed, revealing a complete service of solid silver plate, making a glittering display. Mr. J. J. Dickey, in behalf of the donors, then stepped forward and in a most appropriate speech, in which allusion was made to the long connection and the pleasant relations of the recipient with the company, asked his acceptance of the testimonial. Though completely taken by surprise, Mr. Sweet made a most felicitous reply, reviewing briefly the history of his connection with the business of telegraphy.

The service consists of fifty-five pieces, of elaborate workmanship, and of most beautiful design, and was purchased of Messrs. Giles, Brother & Co., at their establishment, No. 142 Lake street, the whole being valued at \$1,000. The large salver bears the following inscription: "Presented to E. D. L. Sweet, by the employees of the 13th Dist. W. U. T.

Co., as a testimonial of their esteem, on his retirement from the service, July 1, 1868." Mrs. Sweet was also presented with two beautiful silver vases, and an elegant silver toilet set of Bohemian glass, upon a solid silver stand.

After the conclusion of the interesting ceremonies the guests were invited out to a most bountiful collation, which was followed by social amenities, lasting until a late hour. It was a most happy occasion, and passed off to the entire satisfaction of all.

CHESTER, PARTRICK & CO.,

TELEGRAPHIC & ELECTRICAL ENGINEERS,

CONTRACTORS, &c.,

38 SOUTH FIFTH STREET,

PHILADELPHIA.

Manufacturers and Merchants of every variety of

TELEGRAPHIC, ELECTRIC AND PHILOSOPHICAL AP-

PARATUS, BATTERIES, WIRE, ACIDS, INSU-

LATORS, MEDICAL INSTRUMENTS,

AND SUPPLIES.

Respectfully announce that they have increased their facilities for the prompt execution of all orders with which they may be intrusted, whether for the construction of any or all lines of telegraph, or for the supply of apparatus or material.

Among other recent improvements, for which they have secured the sole or part agency, attention is called to the following novelties:

1.—Patent anti-trunton Key with eccentric circuit closers.

2.—Patent Self-closing anti-trunton Key.

3.—Kerite or (horn covered) copper or compound wire or cables.

4.—Covered compound out door line wire.

5.—Blasting apparatus, cartridges, batteries, &c., &c.

6.—Calcium lighting apparatus.

7.—Medical and test batteries, direct and induced currents.

8.—Apparatus for electrical measurement.

9.—Electric gongs of any desired size or weight; alarm apparatus, &c., &c.

10.—Electrical clock work and experimental apparatus of every kind.

The success of the past year and increased resources warrant the promise of dispatch in the execution of all orders, upon terms satisfactory to our customers.

## DURANT'S

## NONPAREIL RELAY.

PATENTED MAY 19 AND JUNE 30, 1868.

This Instrument, having been thoroughly tested on the principle Telegraph Lines in this country, is now offered for sale. It has proved itself a practical

## SELF-ADJUSTING RELAY

under all ordinary conditions of the circuit. It will be found especially valuable in

## RAILWAY TELEGRAPH OFFICES,

where the operator, being frequently otherwise employed, cannot be in constant attendance upon his instrument.

## THE BUNNELL REPEATER,

by the use of this Instrument, is rendered practically Self-adjusting, entirely obviating the annoyance frequently arising from the inattention of operators at repeating offices.

## THE NONPAREIL RELAY

is finished in a manner superior to any other instrument in the market.

## BRADLEY'S PATENT NAKED WIRE HELICES,

the best in use, are used in this instrument, except when otherwise ordered. The parts of the Instrument are

## MADE INTERCHANGEABLE,

so that a duplicate of any portion can be furnished at any time.

The ordinary resistance of this Relay is equal to about Thirty Miles of No. 8 Iron Wire.

Relays of any required resistance will be made to order.

PRICE, \$30.

## THE USUAL DISCOUNT TO DEALERS.

The following Testimonials, out of a number of similar tenor, are presented as a guarantee of the reliability and perfection of the working of these Relays:

NEW YORK, June 23, 1868.

MR. J. C. HINCHMAN.

Supt. Met. District, N. Y.

I have observed the working of Durant's Self-adjusting Relay, which has been on trial at this office during the past week, and feel warranted in saying it is a Self-adjuster, and as such, will work steadily on wires which, with an ordinary Relay, can only be worked with difficulty.

Very respectfully,

A. S. BROWN,  
Manager.

NEW YORK, June 24, 1868.

MR. A. S. BROWN,

Manager W. U. Tel. Office, N. Y.

On the 16th of this month Superintendent Hinchman directed me to try Durant's Relay on our circuits, and report upon its merits. Since the above date it has been in operation here continually. I have tried it upon many of our wires, and find it works equally well on all of them.

There has been but one rainy day during the meantime, and on that day it worked very satisfactory over escape and changeable currents.

On the 18th inst., Nos. 33 and 34 south were lying on the ground between Elizabeth and Somerville, N. J. We could just get Philadelphia by very high adjustment with ordinary Relay, while Durant's Relay recorded Philadelphia's writing as well as upon a clear wire. From the various tests I have submitted it to, I have no doubt that it is a Self-adjuster, and as such will work where any ordinary Relay can be adjusted to work.

Very respectfully yours, &c.,

A. S. DOWNER,  
First Chief Operator, W. U. Tel. Co.,  
145 Broadway, N. Y.

For a full description of the construction and advantages of this Instrument, see JOURNAL OF THE TELEGRAPH of Nov. 16, 1868.

Address all orders to

They publish an Illustrated Descriptive Catalogue of their leading manufactures, to which they respectfully refer.

## AMERICAN COMPOUND TELEGRAPH WIRE.

SUPERIOR CONDUCTIVITY,

LIGHTNESS AND DURABILITY.

A MOST IMPORTANT INVENTION.

We would call the attention of Officers of Telegraph Companies, Telegraph Builders and Contractors, and the Public, to the new

PATENT COMPOUND TELEGRAPH LINE WIRE.

Manufactured by the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY,  
OF NEW YORK.

This Wire has already been put up on sections of several Telegraph Lines, and its merits fully tested, and the results show that it combines all the good qualities which are claimed for it, viz., *Economy, Superior Conductivity, and Increased Strength, with Decreased Weight of Metal.*

In its composition are used three metals, either of which is a good conductor, Steel, Copper and Tin; and the superiority of Copper as a conductor over other metals is well known, and but for its ductility rendering its permanent suspension in a pure state intact impracticable, it would have always been used exclusively as a Conductor on Telegraph Lines. By combining it with Steel the desired strength and permanence is attained, and the necessary weight of the line wires reduced two-thirds, thus obviating the necessity for using a large number of poles to the mile, and by reducing the points of contact, lessening the chances for trouble and escape of the electric fluid.

All other Line Wires must inevitably be superseded by this, and such Telegraph Companies as now adopt it will the sooner realize the advantages to be derived from its use over those whose lines are of the old rotten and rusty iron wire pattern.

Or any other, excepting such as we know to be of inferior quality.

OGDEN'S IMPROVED CARBONS

WITH THE

IMMERSED PLATINUM CONNECTION.

Make, beyond question, the most perfect Battery yet produced. We have abundant testimony of their GREAT SUPERIORITY OVER ANY OTHER.

We particularly invite attention to our whole arrangement of the

CARBON BATTERY.

Proving, as it does, that as much strength may be obtained from this Battery as the Grove, with far less expense.

**DR. L. BRADLEY,**

No. 7 EXCHANGE PLACE, JERSEY CITY, N. J.,

Keeps constantly on hand and for sale his

IMPROVED TELEGRAPH INSTRUMENTS.

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed. His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them. Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1855. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-300th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

PRICES.

Relays with helices in bone rubber cylinders, very fine	\$19 50
Small Box Relays	16 00
Same in Rosewood	17 00
Medium Box Relays	17 00
Same in Rosewood	18 00
Large Box Relays	18 00
Main Sounders same as the above, with heavy armature lever, without local connections	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys	22 00
Excellent Registers	40 00
Pony Sounders	6 75
Keys	6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package. He has ample facilities for furnishing all other kind of Telegraph Supplies at the lowest manufacturers' prices.

VOL. II.

## Still Another Telegraph.

Invention is not dead. Especially in the uses of electricity and magnetism, those twin sisters who have come to crown the nineteenth century with aids to science hitherto unknown, is the inventive genius of our times wide awake. Here is a patent granted for a telegraph system of sounds, tones and divisions of tones, the music of electricity. It needs no insulation. Mr. Brooks and Mr. Varley are not needed. Not even in earth or water does it need an insulating cover! But here is the description.

ENGLISH TELEGRAPH PATENT—E. P. H. VAUGHAN, LONDON.

This invention partly consists in evoking different tones of sound from the atmospheric air by metallic machinery, and dividing such tones into two primary orders of sounds, which evoke other orders—such orders of sound, when separated or combined in a certain way, forming symbols of, and expressing all the letters of the English alphabet.

The invention further consists in collecting, reflecting and directly transmitting these symbolic sounds through naked wires free from insulation, whether the wires be conveyed beneath the earth or under water, and these sounds are so connected by rapid operation of the machines, or so disjointed by silent intervals of time, that they become symbols of intelligence, which are easily converted into letters and notation, and these are instantly conveyed and received at the distal, or receiving extremity of the wire connecting the sending and receiving batteries, the construction and arrangement of which also form a part of the invention.

## Spanish Telegraphs.

By virtue of an order signed at Madrid 17th Oct. last, by M. Sagasta, Minister of State and member of the Provisional Government, Edward Chao, ex-deputy to the Cortes, has been appointed Director General of the Spanish telegraphs.

The new Director General has already commenced the work of regenerating the telegraph service of his country. According to the "*Revista*" they are now considering the propriety of an administrative act in order to profitably utilize the railroad telegraphs.

The liberty of transmission granted to the companies will permit them, in order to protect the interests of the State, to open nearly 500 new offices.

## Recruiting from the Army.

A decree of the date of the 27th of October last directs an exclusive reserve of the various civil employments of the French Government in favor of the military, who, after a leave of absence pass into the service, having contracted a re-engagement of 5 years. The telegraph employees will be recruited from one-third, and the auxiliary messengers from three-quarters of the army.

On account of some inaccuracies of description occasioned by its having been written without the cut before us and with haste, we reprint our notice of Mr. Durant's Relay, and are glad of the opportunity to give it additional publicity.

## The Nonpareil Relay.

CHARLES DURANT, INVENTOR, JERSEY CITY, N. J.

This is an invention which, at first sight, seems ill-adapted to its design, but, like many people we know, improves by acquaintance. Several magnets prepared by Mr. Durant, the workmanship on all of which is of a superior kind, have been in use by experienced operators, all of whom think highly of their capacity as self-adjusters, and have been gratified with the facility with which they accommodate themselves to their altering circumstances, an accomplishment which it is very hard for most people to learn.

The illustrations are so clear and minute that much description is unnecessary. A is a box inclosing helices of the usual size. B is the armature, so placed

It will be seen that the peculiarities of this magnet are three:

1. The axle below the armature is made so delicate as to serve the purpose of a spring, yielding as the magnet draws over the armature to its surface.

2. The armature rests on the core of the magnet at its lower edge, receiving motion only by being drawn over at its upper edge, which is free.

3. The movable bar at the head of the lever of the armature, which is the chief feature in the invention.

The head is adjusted by the screw S to a position when the armature may be said to be at rest, and the usual play is allowed which is given to relays in ordinary. The movable bar will so remain until a stronger current draws the armature to a more vertical position or nearer the cores, when the bar slips correspondingly, and is at once adjusted to the altered condition of the magnetism, the space allowed for play remaining as before.

The spring *e* is adjusted by the raising or depression of the lever F, so as to prevent too great sensitiveness to slight currents generated in the earth, or coming from other wires, as also to prevent too great ease of motion, by which sufficient firmness of stroke would be prevented.

Objections will occur to many minds as they did to us in looking at this magnet, particularly the seeming rigidity of motion by the fixed condition of the lower edge of the armature in connection with the lower axle, and the absence of it in the self-adjusting bar. We can only say that the working of the magnet is very satisfactory and has been used for days without adjustment. The work-

manship on these magnets is most excellent, the parts made with great accuracy, and made to a fixed size and form, so that the parts of one machine can be used on any other. Mr. Durant is now engaged in adapting a magnet to the rapid movements of the printing instrument, which he hopes to render increasingly responsive. The certificates of Messrs. Brown and Downer ought to be regarded as ample guarantee of the merits of this welcome invention. We refer all interested to Mr. Durant's advertisement on another page.

## Correspondence.

### Rheostats and Earth Currents.

Boston, November 5, 1868.

EDITOR JOURNAL OF THE TELEGRAPH:

Reading the article on page 3, JOURNAL of November 2, relating to the employment of rheostats, &c., for the daily examination of the lines in Great Britain, it occurred to me that a brief description of an instrument, which has been in daily use at the Western Union Telegraph Co.'s Boston office since April, 1865, might not be wholly uninteresting to your readers.

This apparatus was constructed by order of Gen. Marshall Lefferts, to be used in connection with a switch board, completed early in 1865. As it was necessary that the whole apparatus should be as com-

that its lower edge touches the corresponding edge of the core of the magnet C. The upper edge of the armature is clear, thus causing the lower edge to act as a fulcrum. D is the head of the armature lever having in it a square socket in which rests a movable bar *d*, easily but accurately fitting the socket and moving freely therein. On either end of this movable bar are platinum points similar to those of an ordinary magnet, the one marked *a*, Fig. 2, being the connecting point, and the other striking the insulated point *i*. F is a lever connected by two pieces of fine wire or silk, *f f*, to a slight straight spring, *e*, Fig. 2, saddling the movable bar *d*, and regulating its pressure on the bar. H H are springs on which the magnet rests, and are designed to prevent the jar of the instrument table affecting the action of the magnet. L L are the usual local connections. M M are the main circuit connections. S is an adjusting screw to determine the play of the movable bar in the head of the armature lever, to which *s s* acts as a binding screw.

pect as possible, the horizontal galvanometer was assigned a position directly over the rheostat coils, the case being fitted into the top of the box enclosing the coils. The needle is tipped with aluminum and describes a circle of five inches diameter. Over this is placed a mirror, hung at an angle of forty-five degrees, in such a manner that its angle may be varied at pleasure.

This arrangement is necessary, in order to observe the position of the needle without climbing to the top of the switch-board (where the apparatus is placed), and looking downward. Over the galvanometer and mirror, and resting upon the rheostat case, is a glass shade for protection against dust, &c.

The coils of the rheostat are of German silver wire, and each coil is wound around its spool double, in order that a current passing through it may be neutralized, as far as relates to any effect upon the needle, which is in close proximity.

The galvanometer coil consists of fifteen layers of three hundred turns each, the different layers connecting with switches, and the use and combination of these sections depending upon the nature of the experiments or tests.

This apparatus, with the exception of the compass, was constructed by Chas. Williams, Jr., telegraph instrument maker of this city, and its coils and other parts were tested and regulated by Moses G. Farmer, Esq., the accomplished electrician.

The apparatus is used chiefly for escape and battery tests, and for the location of the various interruptions occurring through the day.

Every morning the comparative amount of escape on each wire between Boston and New York is ascertained and recorded, always using for that purpose the same section of the galvanometer coil.

Whenever any wire shows an unusual escape, it is located and proper steps taken for its removal. It is also used for testing the efficiency of the batteries at the Boston office, which is done each day, and in bad weather more frequently, and the result of which is also recorded.

To show the sensitiveness of the needle, I will relate an incident which occurred during the first experiment, May 29, 1865, made for the purpose of testing the resistance of the wedge cord to be used in connection with the switch.

The instrument was taken to the superintendent's room, where it was designed to make the test, and before connecting the battery, a peculiar motion of the needle was observed, it being gradually and very slowly deflected to and fro over a space of 20°.

This "irregularity" continued for some days whenever the instrument happened to be in that particular room, and without the cause being discovered, until one Sunday it was noticed that there was no deflection. We, therefore, concluded to look for a cause in the adjoining building, and on the Monday following discovered an elevator, which was in almost constant motion during the day (Sundays excepted) between the cellar and fourth story, deflecting the needle in one direction when above its level and reversing it when below, the extent of the deflection depending of course upon the proximity of the needle to the iron work of the elevator.

In August, 1865, while testing the conductivity of the various loops running from the main office, a resistance of thirty-three miles was discovered on a brokers loop not an eighth of a mile in length, with no relays in circuit or other apparent cause for such resistance, and upon investigation, the trouble was found in a covered wire in the battery room. This loop had apparently worked well, but, of course, such resistances are out of place, and the fact that they are liable to exist, shows the advantages that may be derived from the introduction of the system which the article in the JOURNAL of 2d inst. proposes.

We have made some other very good experiments and tests with this apparatus, in addition to the daily

regulars, one of which having a somewhat curious result, I will copy from the record, and make no further encroachment at this time upon your columns.

In testing the conductivity of certain wires between Boston and Providence, an unaccountable variation of current was noticed, which induced us to ground a wire (No. 2) at Providence, disconnect it south and put the galvanometer in circuit, with no battery on the line. In this experiment the deflection of the needle varied considerably and reached as high as 15°. This was at the time attributed to atmospheric electricity, but further tests seemed to show the error of this conclusion, as the following memoranda indicate :

"SEPTEMBER 26, 1865.—With water pipe for ground connection at Boston and gas pipe at Providence; no battery on wire (No. 2); needle deflected 12° to the left, which is the reverse of our regular battery current; zinc to the line."

"SEPTEMBER 27.—Grounded No. 2 at Mansfield with same result as when grounded at Providence."

"Grounded same wire at the test pole near Boston, and the deflection was increased to 20°, varying from 15°."

"Grounded same wire at the lightning arrester in Boston office and the needle was not deflected." (The ground at lightning arrester in this instance was on a water pipe in the battery room, the other ground being on a water pipe in the cellar, the latter being our regular ground wire.)

"SEPTEMBER 29.—Grounded No. 2 on a metal gutter near Boylston street; needle deflected from 5° to 12° to the right, this being in the same direction as our usual battery current."

"Grounded wire on a lightning rod on the Court House; needle again deflected to the left 10°."

"Grounded on a gas pipe in battery room (the other ground being as before on a water pipe in the cellar); needle deflected from 10° to 12° to the left."

"Grounded on gas pipe in battery room and gas pipe in cellar; no deflection."

"Grounded on water pipe in battery room and gas pipe in cellar, and needle deflected from 10° to 12° to the right."

"Put galvanometer on short circuit in operating room; no battery; one end of coil to gas pipe and other to water pipe, the gas pipe being on the same side of the galvanometer as is usually occupied by the line wire, and the needle was deflected 12° to the left, being the same deflection and in the same direction as when a gas pipe at Providence, and a water pipe at Boston, formed the two ground connections. By reversing the grounds, of course the needle was deflected in the opposite direction."

"The variation of the deflection seems to be considerably less with both grounds in the building than with one of them in another location."

"The above tests show that the variable reversed current noticed on No. 2, with no battery on the line, to have proceeded from an earth battery formed by the two ground connections."

Hoping that the system in vogue in Great Britain may soon be adopted in this country,

I remain, yours, very respectfully,  
G. F. M.

### The Brooks Insulator.

EDITOR JOURNAL OF THE TELEGRAPH:

SIR—The wonderful high resistance of Mr. Brooks' insulator, as shown by the many competition tests to which it has been put during the past year, has caused to be overlooked, I am afraid to too great an extent, the question of its permanency; and while there are few telegraphers who are not convinced of the excellence of the insulator electrically when just from the maker's hands, there are not, on record at least, any proofs of a continuance of excellence after exposure to the influence of heat and cold.

I do not wish to be captious and querulous in this matter, but where so much is involved, and where failures have so long been the rule, where re-insulation has so long been the bane of stockholders, and the terror of operators, and of untold detriment to the public interest, is it not well to raise a warning voice to those who are now "rushing" these insulators on their lines, and suggest the necessity, in view of past experiences, of ascertaining the life of the insulator, that is the ratio of deterioration to which it is subject when exposed, as it must be, to the destroying agencies of the elements?

The peculiarity of Mr. Brooks' insulator, and that feature in which it most excels the old and well known iron-pot insulator, is the paraffine with which the heterogeneous components are saturated; but paraffine is a substance extremely sensitive to varia-

tions in temperature, and under the very great variations to which, encased as it is in iron, it is necessarily subjected in this country, it is soon forced by its own expansion, and semi, if not entire liquefaction, to the mouth of the pot, and from thence, the hottest part on a warm still day, it will fall to the ground, gravitation overcoming adhesion, when, as I have said before, the substance is in a semi-fluid state.

Theory would lead us to suppose that such would be the case, because of the very great difference in expansibility between the paraffine sulphur and sand, and because of the very low temperature at which paraffine fuses—and my experience confirms what I have said.

In the early part of last summer, the Pennsylvania R. R. Co., in increasing their yard accommodations at Philadelphia, had occasion to remove several miles of poles, each having from 8 to 10 wires strung on Mr. Brooks' insulator. Anxious to see how they had stood the test, I examined a large number, and found that, as the rule, what I had anticipated had occurred, that is, that the paraffine had forced its way to the top, where it lay like a lump of soft fat, and could be lifted as a mass from the pot. Upon another and warmer day, I found that the paraffine had become viscous, and that some of it had fallen from the insulators—the poles being in a pile, and more or less inclined favoring this exudation only to a very slight extent. Subsequent examination, the weather increasing in warmth as the summer advanced, showed signs of absolute fusion, and some of the under cross-arms were well greased with the paraffine which had melted and fallen from the insulators of the overlying poles.

It is but justice to say that in a very few instances indeed did I find any part of the insulators broken, and then only when marks on the poles and cross-arms gave conclusive evidence that considerable roughness had been used in taking them down. The insulators were of various ages—none above two years I think—including some of those now made by Mr. Brooks, and which have shown such remarkable resistances when fresh from the maker.

Having been a witness to some of these tests in Mr. Brooks' own office, I am thoroughly convinced of the splendid insulation which paraffine will give, and my letter is dictated by no desire to find fault uselessly, but to suggest that the combination of paraffine with sand and sulphur as at present, is not the best method of securing a permanent union, and that, however excellent may be the insulation at first, telegraphers are hardly prepared to accept merely temporary excellence.

If I am mistaken in my premises, and if the Pennsylvania Co.'s insulators which I have examined, do not include any of the latest pattern, though I think they do, but if there be any doubt on the subject, I would most respectfully suggest to Mr. Brooks that he subject some of his insulators to artificial temperatures as great as those they will be exposed to in practice, that is from minus 15° or 20° to plus 110° or 20° Fah., and see if after a week's trial they have not materially deteriorated electrically. And if they have I am sure that his great practical experience will at once suggest the remedy, and so give us what we have a right to expect from him, the very best insulator in the world.

Respectfully, A TELEGRAPHER

A FRENCH paper records the death by asphyxia of a lady who slept in a room in which were also kept a quantity of quinces. The air of the room was largely vitiated with a peculiarly suffocating perfume, and a very considerable amount of both carbonic acid and carbonic oxide gas. The room in question was always used as a bedroom; no fire had been lighted in it, nor was any other discernible cause for death found but the exhalations of the fruit.

## Cog Hog.

Mr. and Mrs. Reuben Blood were a young and happy couple. They had been united in love's silken bonds three months and two days, when business, urgent and imperative, made it necessary for the loving Bloods to be separated. Their home was Cleveland, beautiful Cleveland, along whose lake-washed shores the Bloods had often strayed on sweet summer evenings and told their love when none but the Bloods and the stars could see. Now Reuben had to go to Buffalo. It seemed a very distant land, and Amy Blood pouted and wept. Reuben, however, went. The parting was tender and impressive, and with weeping eyes and fluttering handkerchiefs the merciless cars separated those whom the priest had joined.

Three days had passed away during which Reuben, active, eager, and full of vim, had pushed his work with earnestness, but not so completely successful as to permit his immediate return. Amy sat at her lonely window, counting the hours, and blaming the laggard sun for his slow progress through the weary days. On the third day, sad and restless, she felt her desolation too intense to bear, and with nervous hand wrote a message to be telegraphed to her absent Reuben to return. The kind-hearted Vanduzer received it, and through the long pipe that leads to the operating room requested rapid transmission.

It was evening. Reuben, tired and waiting for the supper bell of the Mansion House to ring, sat morosely on the office settee looking at his boots and thinking of Amy. Just then a lad made his appearance with a message, and in a sharp, executive voice asked the clerk if Reuben Blood stayed there. Reuben started, gave his receipt, and wildly broke the envelope of the message. The reading of it, however, blanched his cheeks and made his big eyes stand out in wonderment, almost in terror. It was brief, cruelly brief. Two words only appeared between "Reuben Blood, Buffalo," and "Amy." What were they? He could not credit his eyes. "Cog Hog!" It looked insulting. What could the words mean? Did Amy, his own sweet Amy, mean to call him a hog in this epigrammatic way? It was dreadful. The supper bell rang in vain. Reuben's appetite was gone. He had only one vision before his mind, a curious one indeed, in which a hog, fierce and tusky, divided the picture with his Amy.

Reuben ran to the telegraph office. A gentle-faced clerk stood at the counter. "Here, you, sir," shouted the now animated Reuben, "what does this mean?" and he held out the mysterious message on which in plain characters were written—

Reuben Blood,

Cog Hog.

Amy.

"Oh!" replied the amiable clerk, whom long experience had rendered skillful in taming angry customers, "it must be a cypher message."

"Cypher! Amy write me in cyphers! No, sir! my wife don't use cyphers to me, sir! I want to know what this means! You think I believe my Amy would call me a hog? Cog! hog! What in thunder does it mean, anyhow?"

Just then an operator passed the desk, and seeing the excited Reuben, looked over the shoulders of the clerk to see the cause of the trouble, when his practiced eye at once detected the cause. The m, e, and g of the Morse alphabet are composed of the same elements, two dashes and a dot, close together for the g, separated for the m e. Amy had written in the very thrill of tenderness to her absent one, "come home." It was delivered cog hog!

Mildly the relieved but shamed clerk broke the mystery to the impatient Reuben, who was too relieved to retain his anger. "Come home, is it, and no hog at

all? By the great guns, there must be a hog somewhere!" and with this sharp fling at the gentle clerk, Reuben hurried to his supper and the cars. But ever and anon as he looked out on the dark landscape, or gazed on the new comers at the various stations as they came in searching for vacant seats, curious likenesses of a hog—large and fierce and tusky—mingled with all he saw.

We had just finished this sketch when the Supt. of Supplies informed us that the mistake was made on the old United States line. Well, likely it was, but we have no time for corrections now. Good bye, Reuben.

## Among the Wires.

BY A LADY OPERATOR.

The Professor told me if we would take off our main batteries, he would work the line with a steam engine at the Medical College. We tried it one day on a wire which rises in the north-western part of Maine, runs south-easterly and empties into my office. This is a wire the least busy of any, there being but eight country stations connected; an actual, paid message, being a thing of marked occurrence, and passing with "solemn step and slow," on the occasion of a marriage, death, or a barn on fire! I had arranged with Livermore Falls, about a week before the experiment was to take place, that on a certain day he should be on hand, and at the word "now," should remove his main battery from the line, keeping it off for the space of ten minutes, in order to give the Professor a clear track for his engine.

At the appointed time, the Medical class, with spectators, were assembled in the lecture room, from which a wire was connected with my office, a class from the Normal school, with its teacher, being also present at the terminating office on the wire.

When the engine was in readiness, and the Professor had reached that part of his lecture which was to demonstrate the theory that the "perambulating fluid," when subject to the conservation and correlation of forces, will kerflip across any amount of telegraph wire, to the tune of Morse's alphabet, the Professor, who is an amateur telegrapher, called me and remarked: "Make way for the steam engine!" Morally certain that Livermore Falls was at his post, ready to remove his main battery at my call, I answered: "Track clear, go ahead!" and while the engine was puffing, and quivering, and wrenching at its chain, on the short circuit of a wire connected with my office only, I was calling Livermore Falls, with all the energy of a New York night reporter! Alas! the Falls were not to be raised.

For my part, considering the "order of exercises," and the rôle in which the Falls were to play, I was in as great a dilemma as was the man "when a ghost stepped up to his bedside and said, 'Behold Miss Bailly!'" The only alternative was to call the station next in order to me, and tell him to cut off for a few moments, all the stations above him, thus lengthening, by a few miles, the tether of the steam engine, and saving the experiment from an essential fizzle, I being enabled to read by the force of the engine alone, which was charging a circuit of twelve miles or so, the thanks of the Professor and his audience, and to reply that it was "a success!"

Speaking afterward with the station next above me, as to what he thought of the experiment, I found he had remained in blissful ignorance of the whole affair, for all he knew was that "the line acted like the d——!" while in all the stations above him, it was doubtless never stiller since the creation.

## Moral Telegraphic Thermometers.

Fahrenheit is all very well. So is Reaumur; so is Centigrade. But what are they after all? Nothing

but glass and quicksilver. They measure only the season's difference. Meanwhile Dr. Davy—whoever he may be—has beaten them all. He applies the thermometer to humanity, and gauges men and women to half a degree. Thus this astonishing Davy has found out that women average from 97 to 97½ degrees, and men from 99 to 99½. Men are therefore 2½ degrees warmer than women, and heat is not only the cause of motion but e-motion. This profound discovery, connected with the fact that every young woman's pulse beats stronger in the palm of her hand than in her wrist, not only accounts for Juliet's remark to Romeo that "palm to palm is holy Palmer's kiss," but indicates, by high radical authority, the value of the "squeeze" as telegraphic and electric communication from palm to heart. In one view of things this discovery is sentimentally unfortunate, for if the capacity for emotion be measurable by the degree of animal heat, courtship must evidently be reduced to an exact science, and all its empiric glories lost. Thus instead of the old-time lover sighing like a furnace, and committing suicide from despairing uncertainty as to his mistress' capacity to reciprocate affection, we shall have every young fellow armed with a pocket thermometer, and walking up to his inamorata with the following or some similar form of address: "Lovely Miss Squiggins, permit the humblest of your slaves to apply this patent indicator to your palm—you will grasp the bulb firmly, if you please—and see whether the animal heat of your adorable individuality indicates an emotional capacity of 97 or 97½?"

This frightful half degree, be it understood, will be the terrible turning point between hasty flight and frantic adoration. We advise every wise young woman to set her face against this thing at the outset, and the moment any young fellow speaks of Dr. Davy or a thermometer, to turn him off with relentless firmness. Science is destroying enough of our pet dreams and delusions, without reducing the relation of the sexes to an affair of Reaumur, Fahrenheit and Centigrade.—*New York Courier.*

DR. LIEBIG, it seems, has been guilty of a rather big lie in assuring the British public that his extract of meat is a good thing. A remarkable paragraph has appeared in *Once a Week*, calling attention to the results of some experiments made by Dr. Kemmerich with this species of food. It appears that Liebig's extract of meat abounds in potash-salts, and that, although the preparation, administered in small doses, increases the number and strength of the heart's contractions, the effect of larger doses is to kill, with all appearance of paralysis of the heart—a result known to be produced by potash-salts. This has been tested by an experiment on a dog. As it has been the custom of late for cooks to make use of this essence of meat in the production of soup, it is as well that the alleged operation of the extract should be widely known.

A VERY curious phenomenon has been observed from the elevated position of a balloon, and recorded by M. Flammarion. During one of his aerial voyages his attention was attracted to a cloud, about 600 feet in length by 450 feet in breadth, which remained in a state of immovable suspension at an elevation of nearly 300 feet above some trees. The other clouds in the meantime were passing at the rate of 25 feet per second. What invisible anchor held this particular mass of vapor from participating in the motion of its neighbors? Upon steering the balloon below the object of observation, it was discovered that the cloud was stationary immediately above a large piece of water, and that some smaller clouds, immovable, traced out in space the course of a steam. No explanation has been offered of this curious fact, but it is possible that some attraction may exist between the clouds and the sources from which they are created.

## The Earth a Magnet.

That the sun, the source of light and heat, and the great gravitating centre of the solar system, should exercise a magnetic influence upon the earth, and that this influence should vary according to the same law as gravity, or as the distribution of light and heat, will not appear perhaps very surprising. But the discovery by Sabine that the moon exercises a distinctly traceable effect upon the magnetic needle seems to us a very remarkable one. We receive very little light from the moon, much less (in comparison with the sun's light) than most persons would suppose, and we get absolutely no perceptible heat from her. Therefore it would seem rather to the influence of mass and proximity that the magnetic disturbance caused by the moon must be ascribed. But if the moon exercises an influence in this way, why should not the planets? We shall see that there is evidence of some such influence being exerted by these bodies. More mysterious, if possible, than any of the facts we have discussed, is the phenomena of magnetic storms. The needle has been exhibiting for several weeks the most perfect uniformity of oscillation. Day after day, the careful microscopic observation of the needle's progress has revealed a steady swaying to and fro, such as may be seen in the masts of a stately ship at anchor on the scarce-heaving breast of ocean. Suddenly a change is noted; irregular jerking movements are perceptible, totally distinct from the regular periodic oscillations. A magnetic storm is in progress. But where is the centre of disturbance, and what are the limits of the storm? The answer is remarkable. If the jerking movements observed in places spread over very large regions of the earth—and in some well-authenticated cases over the whole earth—be compared with the local time, it is found that (allowance being made for difference of longitude) they occur precisely at the same instant. The magnetic vibrations thrill in one moment through the whole frame of our earth! But a very singular circumstance is observed to characterize these magnetic storms. They are nearly always observed to be accompanied by the exhibition of the aurora in high latitudes, northern and southern. Probably they never happen without such display; but numbers of auroras escape our notice. The converse proposition, however, has been established as an universal one. No great display of the aurora ever occurs without a strongly-marked magnetic storm. Magnetic storms sometimes last for several hours or even days. Remembering the influence which the sun has been found to exercise upon the magnetic needle, the question will naturally arise, has the sun anything to do with magnetic storms? We have clear evidence that he has. On the 1st of September, 1859, Messrs. Carrington and Hodgson were observing the sun, one at Oxford and the other at London. Their scrutiny was directed to certain large spots which at that time marked the sun's face. Suddenly a bright light was seen by each observer to break out on the sun's surface and to travel, slowly in appearance, but in reality at the rate of about 7,000 miles in a minute, across a part of the solar disk. Now it was found afterwards that the self-registering magnetic instruments at Kew had made at that very instant a very strongly marked jerk. It was learned that at that moment a magnetic storm prevailed at the West Indies, in South America, and in Australia. The signalmen in the telegraph stations at Washington and Philadelphia received strong electric shocks; the pen of Bain's telegraph was followed by a flame of fire; and in Norway the telegraphic machinery was set on fire. At night great auroras were seen in both hemispheres. It is impossible not to connect these startling magnetic indications with the remarkable appearance observed upon the sun's disk.—*Cornhill Magazine.*

## Electric Safety Locks.

MM. Duve and Lemaire, two young mechanicians in Paris, have invented a new kind of safety lock. The key opens the lock without ringing the bells; but if a false key be introduced, or a "jimmy," or any piece of metal, the bells are set going as long as the piece is applied. This is effected by the disposal of the several tumblers with regard to a small lever which completes the battery circuit when elevated. When all the tumblers are lifted simultaneously, as by the master-key, the lever is not raised and no alarm is given; but if one or two or three be lifted, the alarm-lever is raised and the ringing takes place. If the burglar, knowing the mechanism of the lock, try to force the lock-plate by any of the usual burglars' instruments, as soon as the metal is attempted to be wedged in, the ringing commences. The safety lock can be applied to all doors or fastenings without distinction. The acting agent of alarm is a feeble current of electricity, produced by a small battery of two elements. The pile used is that of Leclanche (small model), with peroxyd of manganese and a single liquid, which does not require touching for several months, and even then a little water is all that is necessary to replace that lost by evaporation. The master-key is protected by an insulating substance, so that when introduced it establishes no contact, nor does it raise the alarm-levers when the tumblers are lifted. Now, supposing a burglar to have a dozen of these isolated keys, he could introduce any one of them silently; but on his attempting to turn it, the wards not being those of the master-key, the alarm would be continuously given and put an end to his experiments, so that he could not try one key after another.

## Crystallization.

A very curious discovery has recently been made by M. Auguste Bertsch, and turned to practical account by M. Kuhlmann, the celebrated chemist. Who is there that has not, during cold winters, stopped to admire the beautifully symmetrical and yet fantastic figures of leaves and flowers depicted on the window-panes of a well-heated room, the air of which is charged with aqueous particles? M. Bertsch has found that Epsom salts (sulphate of magnesia) dissolved in beer, together with a small quantity of dextrine (artificial gum), and in this state applied to a pane of glass with a sponge or brush, will, on crystallizing, produce the identical designs above alluded to, hitherto considered peculiar to water; with this improvement, however, that the liquid may receive any color whatever, at the option of the operator. The ephemeral productions of frost may thus be easily perpetuated; but M. Kuhlmann, on being apprised of the fact, conceived the idea of going a step further, and transferring those fairy-like creations to stuffs and paper. For this purpose he first got the crystallizations on sheets of iron, on which he afterwards laid one of lead. By means of a powerful hydraulic press the minutest details of the figures in question were durably imprinted on the soft metal, and a copy of them in relief was then obtained by galvanoplastics. But here another difficulty arose: in the impression of cotton stuffs the pattern must be continuous; whereas in M. Kuhlmann's plates the lines at one end would clearly not coincide with those at the other, so that disagreeable interruptions would be caused in the printed designs. This obstacle, however, has been overcome in a most ingenious manner by effecting the crystallization on the cylindrical surface of a roller. A slight rotary motion imparted to it will prevent the liquid from accumulating at any particular point before it has evaporated.

The electric light is to be used for a new light-house at Brindisi in the Adriatic.

## The Bottom of the Ocean.

In 1853, Lieutenant Brooke obtained mud from the bottom of the North Atlantic, between Newfoundland and the Azores, at a depth of more than 10,000 feet, or two miles, by the help of his sounding apparatus. The specimens were sent for examination to Ehrenberg, of Berlin, and to Bailey, of West Point, and those able microscopists found that this deep sea mud was almost entirely composed of the skeletons of living organism—the greater proportions of these being like the *Globigerina* already known to occur in the chalk.

Thus far the work has been carried on simply in the interests of science, but Lieutenant Brooke's method of sounding acquired a high commercial value when the enterprise of laying down the telegraph cable between this country and the United States was undertaken. For it became a matter of immense importance to know not only the depth of the sea over the whole line along which the cable was to be laid, but the exact nature of the bottom, so as to guard against chances of cutting or fraying the strands of that costly rope. The Admiralty consequently ordered Captain Dayton, an old friend and shipmate of mine, to ascertain the depth of the whole line of the cable, and to bring back specimens of the bottom. In former days such a command as this might have sounded very much like one of the impossible things which the young prince in the fairy tales is ordered to do before he can obtain the hand of the princess. However, in the months of June and July, 1857, my friend performed the task assigned to him with great precision, without, so far as I know, having met with any reward of that kind. The specimens of Atlantic mud which he procured were sent to me to be examined and reported upon.

The result of all these operations is, that we know the contours and nature of the surface soil covered by the North Atlantic for a distance of 1,700 miles from east to west, as well as we know that of any part of the dry land.

It is a prodigious plain, one of the widest and most even plains in the world. If the sea were drained off you might drive a wagon all the way from Valentia, on the west coast of Ireland, to Trinity Bay, in Newfoundland. And, except upon one sharp incline, about two hundred miles from Valentia, I am not quite sure that it would even be necessary to put the skid on, so gentle are the ascents and descents upon that long route. From Valentia the road would lie down hill for about two hundred miles to the point at which the bottom is now covered by 1,700 fathoms of sea water. Then would come the central plain, more than 1,000 miles wide, the inequalities of the surface of which would be hardly perceptible, though the depth of the water upon it varies from 10,000 to 15,000 feet; and there are places in which Mount Blanc might be sunk without showing its peak above water. Beyond this, the ascent on the American side commences, and gradually leads for about three hundred miles to the Newfoundland shore.

Almost the whole of the bottom of this central plain (which extends many hundred miles in a north and south direction) is covered by a fine mud which, when brought to the surface, dries into a grayish-white friable substance. You can write with this on a blackboard, if you are so inclined, and to the eye it is quite like very soft, grayish chalk. Examined chemically, it proved to be composed almost wholly of carbonate of lime; and if you make a section of it in the same way as that of a piece of chalk was made, and view it with the microscope, it presents innumerable *Globigerina* embedded in the granular matrix.

Thus this deep sea mud is substantially chalk. I say substantially, because there are a good many

minor differences, but as these have no bearing upon the question immediately before us—which is the nature of the *Globigerina* of the chalk—it is unnecessary to speak of them.

#### Dismissals.

Nothing is more painful than the examination of the monthly reports of the dismissed operators, which, were we to publish, would give a sad interest to the paper and grieve many hearts. Some deserve this unenviable publicity. There are some operators who, with all our love for the craft, we would be glad to see struck forever from the profession—fellows who are wandering blackguards, swinging round the circle of the districts, and disgracing themselves in all.

From the Central division we have—

1. Discharged for deserting his post.
2. Discharged for drunkenness and disorderly conduct.
3. The same.
4. The same.
5. For using information for outside purposes.
6. Embezzlement of office funds.
7. Infidelity in making returns.
8. Incompetency.
9. "For being a rascal." Passes under feigned name. Real name supposed to be Gregg. Carries good letters.
10. Forgery and bad conduct.
11. Drunkenness.
12. The same.

This is a sorry list, which we would rather not see. We wish that the item "discharged for drunkenness" could forever disappear. Among the many organizations now in active operation is there not room for a Telegrapher's Temperance Society?

PULFORD's magnetic paints have been adopted for all iron work in the British marine service.

#### Military Cables and Signals.

The Telegraphers of the regiment of Engineers, at Antwerp, established on the 30th of Sept. (with the aid of the bridge-keepers) two flying posts united by a submarine cable of more than a kilometre (1100 yds.) in length, from shore to shore of the Escault. These posts worked with perfect regularity during a great part of the day. Their installation required only 20 minutes. This kind of work, in which the Engineers will be exercised in the future, will allow the establishment of a rapid telegraphic communication between two corresponding points on the shores of rivers, and also between any two parties in the fortifications.

Another system of correspondence is also introduced (that of signaling). Any one, seeing a soldier standing upon the dike in front of the city, and making violent gestures with his arms, probably would not suppose that he held a very peaceable conversation with one of his comrades placed in an embrasure of the Fort of Saint Michael.

#### The Cable to Egypt.

The laying of the new cable between Malta and Alexandria has succeeded perfectly. This is a new success for the company represented by Sir James Anderson, which has taken the contract to strengthen the old cable between Malta and Alexandria, belonging to the English Government. This cable, unfortunately, was placed along the coast at an insufficient depth, which was the cause of frequent interruptions. The new cable escapes this inconvenience, and allows, besides, of a reduction of the tariff.

#### The Russia-Denmark Cable.

The Emperor of Russia will approve the decision of the Council of Ministers, relative to the concession of a Submarine Telegraph between Russia and Denmark. This concession is granted to K. F. Titger, President of the "Dano-Anglo-Norwegian Telegraph Company" and director of the private bank of Copenhagen, and to the negotiator, G. G. Triksen, a member of the same company. The company engages to unite the Russian and Danish Telegraphs. Starting from the shores of the Baltic, near Zibau, at a point which will be designated by common agreement between the Russian Government and the grantees, the cable will touch at the Island of Bornholm, and will come out on the Danish territory at a point designated by the Government of Copenhagen. This cable will be single between Zibau and Bornholm, and, at the least, double between Bornholm and Denmark. One of these last conductors will be exclusively for the Russian correspondence, the other for the international correspondence of Denmark. In case of the breaking of one of these cables, the remaining one will be used for the Russian correspondence. The time fixed for completing this submarine communication is one year from the date of the last grant made by one or the other of the two governments, in order that the communication may be entirely established in the course of the autumn which follows the expiration of this term.

#### Self-Closing Key.

Here is a sketch, somewhat rudely executed, of a self-closing key, which, being an idea of our own, we have supposed might answer the purpose. It requires no clasp. The circuit must open on applying the finger to the finger plate, and must close when removed.

A is a bar swung on the arm of the key at 1, and, of course, moving with it when in action. One end of this bar comes above the finger plate, terminating in a pad which comes half over the finger plate when the circuit is closed. When open, the pad is pressed aside and rests against the finger, but does not impede its motion or rub it, unless when the finger is lifted from the plate. The bar A is closed by the action of a spring 2, of suitable strength, the connection being made upon a platinum point at B. We think it accomplishes, in a very simple way, the automatic closing which is deemed desirable. A key combining Benton's homogeneous bar, and this self-closing arrangement, we have thought, the vanity being excused, a very useful combination.

The Key made by Mr. Frey is a very useful thing, neat and simple, firm in the action, and yet easy and pleasant to the touch.

#### The People's International Cable.

At Berlin it is proposed to organize a company for the purpose of laying a new Telegraph Cable between Europe and America, giving it the name of "The People's International Cable." The basis of this arrangement is, that the subscribers will receive checks, which will be accepted in payment for the transmission of dispatches, when the line is completed.

#### A Telegraphic Feat.

CLEVELAND, Dec. 11, 1868.

EDITOR JOURNAL OF THE TELEGRAPH:

DEAR SIR:—I take the liberty to send you the enclosed extract from the *Cleveland Herald* of December 10th. As it is an unsolicited tribute to the excellent work done on the message here, perhaps you will deem it worthy of notice in the JOURNAL.

The names of the operators who received the message are as follows: F. A. Stumm, Wm. A. Manning, N. C. Griswold, H. M. Harris.

The President's Message as sent over the wires was the finest feat of the artificial lightning that we have known. The correctness with which it was telegraphed, shows a very great improvement from year to year in this now indispensable means of intellectual communication. Four wires were used, and the thing was rapidly and correctly done.

We must thank the operators in the office in this city for the legible manner in which they executed their duties. The copy furnished us was almost as legible as print, and infinitely more legible than the daily manuscript furnished our printers by editors and correspondents. Telegraph operators should feel that plain chirography and correct spelling are almost as important as correct hearing.

I noticed, in a late number of the JOURNAL, the "Pie Clerk" story charged to the account of a lady operator. Justice to the fair sex requires that this correction should be made. The message in which the mistake occurred was received in this office some twelve years or more since from the depot office, by a young gentleman who shortly after emigrated to California. He first received the signature as follows: "Chas. Gilles Pic Lock Steamer Ocean." It was of course returned to him for correction. He then had it repeated and made the famous mistake so ungenerously attributed to a "lady operator."

One more specimen bull and I will close. A message was received in the Buffalo office some months since directed to the Hon. Rev. Ben. E. Fenton, Jamestown, N. Y. It will hardly be necessary for me to explain that it was meant for his Excellency Gov. Fenton, to whom it was forwarded without delay.

Congratulating you on the improved appearance of No. 1, Vol. 2d, of the JOURNAL, and wishing you the success so well merited, I remain

Yours truly, E.

NOTE. We beg the pardon of all lady operators for our mistake—Ed.]

#### Prompt Cable Service.

NEW YORK, Nov. 30, 1868.

Cyrus W. Field, Esq.

DEAR SIR:—On Wednesday, the 25th inst., we received at 8.10 A. M., a cable message from our London friends. As none of the firm were here at the time of its arrival, it was not answered till ten o'clock. We received a reply to our message at quarter past two, and replied to same immediately. It affords us pleasure to give this information to you, knowing that you will be interested in hearing of so creditable a performance on the part of "the cable."

Very truly yours,  
D., M. & Co.

NOTE. This is a fair specimen of the promptitude with which the European business is done every day. Ed.]

#### Very Sharp.

A boy, five years of age, having stolen a can of milk, his mother took him to task with moral suasion, and wound up her discourse by exclaiming:

"What in the world was you going to do with the milk, anyhow?"

"I was going to steal a little dog to drink it," was the crushing reply.

## WESTERN UNION TELEGRAPH.

## Official Annual Statement.

In pursuance of a Resolution of the Board of Directors, the following exhibits from the Report of the Treasurer presented at the semi-annual meeting on the 2d instant, are given for the information of stockholders, viz:

## I.

## STATEMENT OF REVENUE AND DISBURSEMENTS FOR 6 MONTHS ENDING DECEMBER 31, 1868.

	Gross Receipts.	Working Expenses including Paid other Lines, Rents, Taxes, Reconstruction, &c.	Net Profit.
July, . . . . .	\$601,730 61	\$396,163 66	\$205,566 95
August, . . . . .	602,304 73	376,452 03	225,852 70
September, . . . . .	630,665 36	372,197 50	258,467 86

Increase, . . . . .	\$595,992 71	\$249,247 81	\$347,744 90

## WESTERN UNION TELEGRAPH CO.

## The Work of the Past Year.

We have given in another column the financial exhibit of the year now closing, showing a net profit exceeding the previous year of \$347,744.90. This result is largely due to the increase of facilities provided, and which the company is supplying as freely as a careful regard to all interests make possible.

We now give a rapid sketch of the work of those who come closest to the springs of actual success, and on whose fidelity so largely depends the future of the company.

The work of the year has been large and important. Never did the company enter upon a new year with its lines in such admirable condition.

## LINES ON THE PACIFIC.

During the past year there have been 450 miles of wire added to the former facilities for business in the States of California and Nevada, besides the replacing of old wire with new. In 1869, 1,485 miles of wire will be used to complete the connections by the Pacific railroad, and which will render communication between the extremes of the nation complete and reliable.

## IN THE SOUTHERN DISTRICT.

A large amount of work has been done in the Southern States during the year in completing the reconstruction of dilapidated structures and in perfecting communication with Cuba and important Southern cities. The reports show:

New construction . . . . .	373 miles.
Reconstructed . . . . .	759 "
Removed . . . . .	215 "

In this work 26,766 new poles have been planted, besides 1,800 more used in the ordinary repairs and strengthening of the lines. Gen. Supt. Van Horn says:

"The construction in Virginia and North Carolina gives us additional facilities which were much needed and of great value to us in bringing up our business from Georgia, Florida and Alabama. We have now another through wire to Augusta, Ga., lines to the termini of newly constructed railroads, the obstructions to the Cuba business removed, and by the completion of the railroad and our lines between Selma, Rome and Dalton we have secured a new and valuable route from Chattanooga to New Orleans. All this work will give greatly increased ease in the transmission of our business, and must largely reduce the cost of current repairs."

## CENTRAL DIVISION.

The work on this division has been large and important. The larger portion has been on the great route now provided by the construction of the Pacific railroad. The following are the items:

New poles, Omaha to Cheyenne . . . . .	515 miles.
Second wire, Cheyenne to Kearney . . . . .	325 "
Removed line, Fort Sedgewick to Denver . . . . .	190 "
New line, Cheyenne to Laramie . . . . .	56 "

Much of this work has been done under protection of military escorts, and has been expensive on account of the absorption of labor by the railroad company and the high charges for transportation.

Gen. Supt. Stager says: "With the completion of this work we have 3 wires on new poles, Omaha to Cheyenne, 515 miles; two wires on new poles, Cheyenne to Laramie, 56 miles, and 1 wire from Omaha to Laramie City, 572 miles.

"West from Laramie City the holes are dug most of the distance to Green river, 300 miles, and about 100 miles of poles distributed, and we will probably have a wire complete to Ham's Forks, Utah, this season, which will give us two wires from Omaha to Salt Lake for through business, and a third, Omaha to Denver, for way and Colorado business."

To show the immense activity ever at work on these far western connections, we subjoin the following:

CLEVELAND, Dec. 2, 1868.

HON. W. ORTON, Pres't.—Have just received following from Supt. Hibbard: "Since writing my report to you, October 22d, we have in this district strung a second wire from Omaha to Kearney, 191 miles, and a third wire from Fremont to Kearney, 145 miles. The taking down of old line on south side of Platte river, between Kearney and Fort Sedgewick, 200 miles, has been completed, and most of the wire and insulators transported to the railroad. The old lines from Omaha to Kearney by wagon road, 200 miles, have been taken down. One wire on cross arms from Cheyenne to Laramie, 56 miles, has been completed, and the old wire on stage road from Laramie, via Park Station, to Cheyenne, 90 miles, taken down. A third wire has been put on poles between McPherson Station and Ogatalla, 50 miles."

ANSON STAGER, Gen. Supt.

The report embraces a large number of lines built, and others reconstructed, the following being the summary:

New lines constructed, . . . . .	1,267 miles of poles.
	2,067 miles of wire.
Lines reconstructed, . . . . .	3,405 miles of poles.
	2,197 miles of wire.
Re-insulated, . . . . .	3,241 miles.
Old wire removed, . . . . .	1,173 miles.

In performing the work of this Division during 1868, over 60,000 new poles have been used.

## EASTERN DIVISION.

In this Division, which embraces all the lines east of Buffalo and Richmond, the work has been so fragmentary, yet so extensive, that a summary is exceedingly difficult. No work has been more useful or has produced better results. The whole closely webbed network of wires which crowd the Eastern States, have been carefully overhauled, cleaned, the insulators to a large extent replaced or cleaned, the joints of the wires remade and soldered, and the lines increased in effectiveness. The merit of the work was markedly shown during one of our last rain storms, when an important route, whose dozen wires were usually reduced to two or three available ones, was found to be in condition to do full and prompt service on each of its 12 wires. It is easy to see that such a service is equal to the creation of new lines.

The whole number of new lines and loops constructed during 1868 in this Division was 45. Twenty-two loops were constructed in the city of New York, of which there are now 48 for facilitating the direct connection of important city centres with distant cities. The lines built, of which there have been 23, vary in length from 1 to 200 miles each, the whole numbering 500 miles of carefully constructed line, and on which about 720 miles of new wire have been strung. One of these lines provides Boston with a new route to Buffalo.

The number of miles of line reconstructed shown by the report is 1,652, with about 1,600 miles of wire strung where facilities were needed, or changes in the working arrangements required it. As the result of all this varied and fragmentary work, the lines have greatly increased in effectiveness, and communication has been rendered throughout the whole Division, with few exceptions, easy and rapid.

It is a remarkable fact that on account of the improvement of the conducting power of the wires, and a more effective arrangement of the office forces, almost every mile of the wires erected has been taken from other routes without the necessity of expending a dollar for new wire.

We need not add that this important Division is under the charge of Gen. T. T. Eckert, whose enthusiastic discharge of duty is too well known to require comment at our hands.

## The Right Spirit.

NORTH ANDOVER, Mass.

D. R. DOWNER, Secretary,

DEAR SIR:—Notice of my assessment comes to hand by this morning's mail. I enclose the amount, and if were ten times more I would cheerfully give it. Don't think I could give it in a better cause. Yours,

ANDREW SMITH, Manager.

This is only one out of many of a similar character, some asking forms of application to secure new members, and which were promptly sent. It is creditable to the profession that long before formal notice could have been received, the dollar assessment came pouring in even from distant States, testifying to the delightful spirit which animates the members of the association. We ask all to read the letter of Mr. Winne's friend and executor to see how they have aided in comforting a dying brother and providing for his orphan brother and sister. We hope it will stimulate not only all actual members to a prompt remittance of the dollar assessment now due, but to interest others in becoming members of the association. It is sustained for no end but one—the good of its members.

In answer to inquiries, we may state that immediately on the announcement of the last death over thirty applications for membership were made, the whole number of certificates out now being 385, of which about 20 may be regarded as delinquent members. We hope to see the amount reach 500 before many weeks.

## The Death of John T. Winne.

A few days ago we were called upon to bid adieu to one whom all loved. We refer to John T. Winne, who died Nov. 23d.

He was a young man of blameless character and worth, who loved and feared God, was upright in all his dealings, and always extended a helping hand to those in distress.

During all his severe illness he was ever patient, never murmuring against Him who saw fit to afflict him. His parents both died some years ago, leaving to his care a younger brother and sister, and he did his duty to them nobly as long as health was allowed him—nay, more, he did that which we consider the duty of every man—he provided, as far as was possible, for them after his death.

Some time before he was taken ill, he was advised to become a member of the Tel. Mutual Life Insurance Association. Many times during his illness, after all hope of restoration had passed, he remarked to those who visited him, "How thankful I am that I became a member of the Insurance Association, for now I have no remaining cares or thoughts as to who will defray my funeral expenses. I, also, know there will be a balance left for Katie and Willie."

These little ones were his whole care. And, thanks to that noble institution, it will be a relief to many a poor mortal, when on his dying bed to think, "My family will be under no expense, and thank God they will have something after I am gone."

Oh, that every telegrapher in the country would see the necessity of building up and sustaining such a grand institution! It not only benefits their families after their death, but it does away with the circulation of subscription papers, which we have hitherto responded to with a good heart and ever ready hand. There is no necessity for these now. There is too much of humiliation about them. It is too like a charity burial. A man insured has no such feeling. He claims his insurance as his right. He has helped sustain it in life, and at death it relieves those he leaves to mourn his loss. We would urge upon every one the necessity of coming forward and joining us heart and hand, firmly believing they would never regret such a step.

W.

## DURANT'S

## NONPAREIL RELAY.

PATENTED MAY 19, JUNE 30, AND DECEMBER 8, 1888.

This Instrument, having been thoroughly tested on the principal Telegraph Lines in this country, is now offered for sale. It has proved itself a practical

## SELF-ADJUSTING RELAY

under all ordinary conditions of the circuit. It will be found especially valuable in

## RAILWAY TELEGRAPH OFFICES,

where the operator, being frequently otherwise employed, cannot be in constant attendance upon his instrument.

## THE BUNNELL REPEATER,

by the use of this Instrument, is rendered practically Self-adjusting, entirely obviating the annoyance frequently arising from the inattention of operators at repeating offices.

## THE NONPAREIL RELAY

is finished in a manner superior to any other instrument in the market.

The parts of the Instrument are

## MADE INTERCHANGEABLE,

so that a duplicate of any portion can be furnished at any time.

The ordinary resistance of this Relay is equal to about Thirty Miles of No. 8 Iron Wire.

Relays of any required resistance will be made to order.

PRICE, \$30.

## THE USUAL DISCOUNT TO DEALERS.

The following Testimonials, out of a number of similar tenor, are presented as a guarantee of the reliability and perfection of the working of these Relays:

NEW YORK, June 23, 1888.

MR. J. C. HINCHMAN.

Supt. Met. District, N. Y.

I have observed the working of Durant's Self-adjusting Relay, which has been on trial at this office during the past week, and feel warranted in saying it is a Self-adjuster, and as such, will work steadily on wires which, with an ordinary Relay, can only be worked with difficulty.

Very respectfully,

A. S. BROWN,  
Manager.

NEW YORK, June 24, 1888.

MR. A. S. BROWN,

Manager W. U. Tel. Office, N. Y.

On the 16th of this month Superintendent Hinchman directed me to try Durant's Relay on our circuits, and report upon its merits. Since the above date it has been in operation here continually. I have tried it upon many of our wires, and find it works equally well on all of them.

There has been but one rainy day during the meantime, and on that day it worked very satisfactory over escape and changeable currents.

On the 18th inst., Nos. 33 and 34 south were lying on the ground between Elizabeth and Somerville, N. J. We could just get Philadelphia by very high adjustment with ordinary Relay, while Durant's Relay recorded Philadelphia's writing as well as upon a clear wire. From the various tests I have submitted it to, I have no doubt that it is a Self-adjuster, and as such will work where any ordinary Relay can be adjusted to work.

Very respectfully yours, &amp;c.,

A. S. DOWNER,  
First Chief Operator, W. U. Tel. Co.,  
145 Broadway, N. Y.

For a full description of the construction and advantages of this Instrument, see JOURNAL OF THE TELEGRAPH of Nov. 16, 1888.

Address all orders to

CHARLES DURANT,  
Office and Factory 66 South Street,  
New York City.

## The Galaxy.

It turns out that it is the publishers of *The Galaxy* who have secured that greatest of the year's literary prizes—the new serial story by Charles Reade, for which the popular author, it is said, is to receive fifty thousand dollars from them and from his English publishers. The new story will be commenced early in the year. *The Galaxy* has also purchased the advanced sheets of the new story by Mrs. Edwards, the author of "Steven Lawrence, Yeoman," and "Archie Lovell," two of the most successful of recent novels. This attractive serial will be commenced in the January number. With these two authors among its stars, *The Galaxy* promises to shine brilliantly during the coming year. But it by no means stops with them. Richard Grant White, whose scholarly articles on "Words and their Uses," have been doing so much for good English, is to contribute to the volume for 1869 a series of papers on "Americanisms." Dr. W. A. Hammond, the leading American authority on diseases of the mind and nerves, and an able writer, is to furnish some papers in his important specialty. Eugene Benson, who is gaining a wide reputation as a brilliant essayist, is to analyze, in a series of articles, the characteristics of the leading journalists of New York—Greeley, Raymond, Parke Godwin, W. H. Hurlbut, and others. Another noticeable series of articles will be criticisms upon the principal living American authors. Besides these, Scientific, Social, Literary, Practical, and Economical Articles are promised by Prof. E. L. Youmans, H. T. Tuckerman, Edmund C. Stedman, Schele de Vere, Justin McCarthy (the editor of the London *Morning Star*, now visiting this country), William R. Alger, John Meredith Read, Jr., and other well-known writers. From Mark Twain humorous articles may be expected. From Henry James, Jr., Harriet Prescott Spofford, Caroline Chesebro, Jane G. Austin, John Esten Cooke, and others, short stories and sketches. Taking *The Galaxy's* prospectus for 1869 altogether, it offers one of the most tempting bills of fare to magazine readers ever set before an American public.

**A NEW INVENTION.**—The long-sought-for process of the simultaneous printing of several colors has, at length, attained to what may be regarded as a gratifying success. We have witnessed, in the office of Messrs. French & Wheat, Nos. 13 and 15 Park Row, the working of the press of which these gentlemen are the proprietors, and to whose persevering endeavors its present perfectness is owing. As a press, it is a combination of the principles of Hoe, Taylor, &c. Its novelty consists in the adjustment of a series of secondary cylinders around the main printing cylinder. To each of these secondary cylinders is attached fountains, distributors, and rollers for distributing and rolling each color separately; and to this cylinder is also attached the electrotype whose impression is to be given to the paper in its passage over the main cylinder. The final impression, being black, is received by the form on the bed-plate, in the usual manner; and the paper comes forth with its illustrations impressed in seven colors, as well as with the ordinary letter-press—all done at one revolution of the cylinder. The capacity for work is as great as that of any ordinary cylinder of the same size. This press is likely to prove valuable in printing large editions of lower-priced illustrated papers.

ACCORDING to M. Dulaurier, a mixture of azotic acid, of sulphuric acid, and sulphate of iron is the best existing liquid that can be employed for an iron voltaic pile. Under the influence of the current all the azotic acid of this mixture is transformed into ammonia, which passes to the state of a sulphate.

## Personals.

RACINE, Wis. Dec. 3, 1868.

EDITOR JOURNAL OF THE TELEGRAPH:

DEAR SIR:—I note the following changes since last report:

A. C. Lathrop transferred from Savanna, Ill., to Albany, Ill., vice W. J. Weld, relieved December 1st.

F. C. Hanover appointed operator at Savanna, Ill., vice Lathrop transferred.

We are using Brooks' insulators on this line, and from pretty good tests find them superior to all others. One thing I notice is that no poles which have Brooks' insulators on were shattered by lightning this summer, while scores of others were. In haste, yours,

E. O. WART.

John M. Peters, formerly operator on B. & O. R. R. Tel., at Camden Station, Baltimore, has been attached to the Stock Exchange office of the W. U. Co. at New York.

W. W. Shipman, clerk at W. U. Co.'s Stock Exchange office, New York, has resigned from ill health.

Supt. J. M. Nye is busy setting up poles, etc., of the Southern Minn. R. R. Telegraph line, and expects all the wire to be strung in a few weeks.

Oakley Purdy goes to Buffalo for the W. U. Co.

We have to omit the balance of our personals.

## Life Lengthened.

1. Cultivate an equable temper; many a man has fallen dead in a fit of passion.

2. Eat regularly, not over thrice a day, and nothing between meals.

3. Go to bed at regular hours. Get up as soon as you wake of yourself, and do not sleep in the daytime, at least not longer than ten minutes before noon.

4. Work always by the day, and not by the job.

5. Stop working before you are very much tired—before you are "fagged out."

6. Cultivate a generous and an accommodating temper.

7. Never cross a bridge before you come to it; this will save half the troubles of life.

8. Never eat when you are not hungry, nor drink when you are not thirsty.

9. Let your appetite always come uninvited.

10. Cool off in a place greatly warmer than the one in which you have been exercising; this simple rule would prevent incalculable sickness and save millions of lives every year.

11. Never resist a call of nature for a single moment.

12. Never allow yourself to be chilled "through and through;" it is this which destroys so many every year, in a few days' sickness, from pneumonia, called by some lung fever or inflammation of the lungs.

13. Whoever drinks no liquids at meals will add years of pleasurable existence to his life. Of cold or warm drinks, the former are most pernicious; drinking at meals induces persons to eat more than they otherwise would, as any one can verify by experiment, and it is excess in eating which devastates the land with sickness, suffering and death.

14. After fifty years of age, if not a day laborer, and sedentary persons after forty, should eat but twice a day, in the morning and about four in the afternoon; persons can soon accustom themselves to a seven-hour interval between eating, thus giving the stomach rest; for every organ without adequate rest will "give out" prematurely.

15. Begin early to live under the benign influence of the Christian religion, for it "has the promise of the life that now is, and of that which is to come."—*Hall's Journal of Health.*

THE author of "Among the wires," published in No. 25, must excuse our carelessness in omitting a paragraph which marred its meaning. We will be more careful. There is some mystery about her present article which we have no time to discuss. Does she mean to say that a current from that steam engine reached her office?

CHESTER, PARTRICK &amp; CO.,

TELEGRAPHIC &amp; ELECTRICAL ENGINEERS,

CONTRACTORS, &amp;c.,

88 SOUTH FIFTH STREET,

PHILADELPHIA.

Manufacturers and Merchants of every variety of

TELEGRAPHIC, ELECTRIC AND PHILOSOPHICAL AP-

PARATUS, BATTERIES, WIRE, ACIDS, INSU-

LATORS, MEDICAL INSTRUMENTS,

AND SUPPLIES.

Respectfully announce that they have increased their facilities for the prompt execution of all orders with which they may be intrusted, whether for the construction of any or all lines of telegraph, or for the supply of apparatus or material.

Among other recent improvements, for which they have secured the sole or part agency, attention is called to the following novelties:

1.—Patent anti-trunion Key with eccentric circuit closers.

2.—Patent Self-closing anti-trunion Key.

3.—Kerite or (horn covered) copper or compound wire or cables.

4.—Covered compound out door line wire.

5.—Blasting apparatus, cartridges, batteries, &amp;c., &amp;c.

6.—Calcium lighting apparatus.

7.—Medical and test batteries, direct and induced currents.

8.—Apparatus for electrical measurement.

9.—Electric gongs of any desired size or weight; alarm apparatus, &amp;c., &amp;c.

10.—Electrical clock work and experimental apparatus of every kind.

The success of the past year and increased resources warrant the promise of dispatch in the execution of all orders, upon terms satisfactory to our customers.

**A Telegraphic Feat.**

The readers of the *Union and American* are indebted to the Western Union Telegraph line for the transmission of the President's message, which will be found entire in these columns this morning. This long and highly interesting document was presented and read to Congress yesterday at noon. It contains 18,000 words, and the last was delivered at our office a few minutes after seven last night. Its transmission occupied, over one line of wire, six hours and fifty minutes, an average of forty-four words per minute, during the whole time occupied in its transmission. Two operators only received it at the Nashville office, Messrs. Spencer and Stewart, whose accuracy is pronounced remarkable, considering the amount of matter and the time consumed. This telegraphic feat will compare favorably with any that has been performed since the institution of the telegraph.

In this connection we desire to offer our grateful acknowledgements to the officers of the Western Union Company, who were so efficient in securing the prompt transmission of the report.

**A New Constant Battery.**

A new arrangement for furnishing currents of electricity has been made known by M. Ney. It is composed as follows: (1) a vessel filled with solution of chloride of ammonium, containing a plate of amalgamated zinc; (2) a porous cylinder filled with carbonate of copper, into which a plate of copper plunges. To maintain the battery in action, it is only necessary to add solid chloride of ammonium from time to time. In military telegraphy, where the pile should be capable of transport, the outer vessel might be filled with sand saturated with a solution of chloride of ammonium in the place of the solution. This arrangement recommends itself on the score of cheapness, for native carbonate of copper answers sufficiently well, and it likewise only requires attention while in actual use. Carbonate of copper is insoluble in a solution of chloride of ammonium, but upon closing the current, the chloride is decomposed into hydrochloric and ammonia; the hydrochloric acid collects at the zinc pole, the ammonia at the copper. The carbonate of copper becomes soluble, and its reduction gives rise to a secondary current having the power of a Daniell's element. This form of battery is perfectly constant.—*Chemical News.*

**Strange Phenomenon in Scotland.**

"Peter Wilkin's" loadstone seems to be located at Forres, in Scotland. The Ordnance Survey officers have discovered there an extraordinary deflection of the plumb line. As there are no mountains near Forres, they have concluded that there is a mass of unusually solid matter beneath the surface, or a large cavity in the sea, which is not far distant. The matter will be tested by establishing two clocks, placed east and west, one at Forres, forty miles distant; by the side of each clock there will be a magnet connected with the opposite clock by an electric wire. The magnet will be made to click, so as to mark the vibrations of the pendulum of the distant clock, and the difference in the vibrations of the pendulums will reveal the force and direction of the deflection of the plumb line, and thus the cause of the curious phenomenon at Forres will then be ascertained. While Science labors to discover the cause, a sensational novel by Charles Reade, or a drama by Dumas, based upon the phenomenon, or a romance from Hugo would be in place.

**Austro-German Union Telegraphs.**

The near dissolution of the Telegraphic Conference, which met at Carlssuhe, and composed of the ambassadors of the States that form the Austro-German Telegraphic Union—that is to say, of Bavaria, of the Grand Duchies of Baden and Hesse Darmstadt, of the Confederation of Northern Germany, of the Lower Countries, of Austria, of Hungary, and of Wurtemberg—is announced. The new treaty, founded upon the basis of a division of the territory belonging to the Austro-German Union into three circles, will create notable reductions in the tariff.

**EDISON'S****DOUBLE TRANSMITTER.****THE MOST PRACTICAL APPARATUS OF ITS KIND YET INVENTED.**

Complete Sets (put up in working order), price \$400, \$450, \$500.

Boston, Mass.

**SPECIAL NOTICE.**

L. G. TILLOTSON & CO.,

11 DEY STREET, NEW YORK,

AND

BLISS, TILLOTSON & CO.,

171 SOUTH CLARK STREET, CHICAGO, ILL.

Respectfully inform their customers, and all parties purchasing

TELEGRAPH AND ELECTRIC MATERIALS,

that they have been appointed by the

BISHOP GUTTA PERCHA COMPANY, OF NEW YORK,

General Agents for the sale of any articles manufactured by them FOR TELEGRAPHIC AND ELECTRICAL USE.

They are now prepared to fill promptly any orders for goods on hand, or to be manufactured, at the Company's prices in New York. The long experience of this Company (and that of Mr. SAMUEL C. BISHOP, its immediate predecessor) in the manufacture of

PURE GUTTA PERCHA GOODS,

and the reputation they have gained and enjoy for the superior quality and perfection of manufacture of their

SUBMARINE TELEGRAPH CABLES

AND

INSULATED WIRES,

of various kinds, insulated with pure Gutta Percha, renders this arrangement a very important one for our numerous patrons throughout the country, and we confidently recommend these goods to their special notice as being fully equal, if not superior, to any other in use.

The principal articles manufactured and offered for sale are

SUBMARINE TELEGRAPH CABLES,

(Any size required.)

Gutta Percha Covered Telegraph Office Wires, in great variety of size and style.

Subterranean Wires, covered with Gutta Percha and Lead outside, various sizes.

Subterranean Wires with Gutta Percha and braided fibre, and Bishop's Patent Compound outside.

Subterranean Wires, with Fibre and Bishop's Patent Compound outside.

Pole Line Cordage, with Fibre and Bishop's Patent Compound outside.

Bridge's Patent Electric Cordage.

Bridge's Patent Double Covered Cordage.

BISHOP'S PATENT COMPOUND WIRE

for out-door use and office connections.

INSULATED WIRES,

with two Conductors, both plain and with braid outside, and a great variety of other kinds made to order.

Cotton and Silk-Covered Wires, both twist and braided.

This arrangement with the Bishop Gutta Percha Company, together with our own extensive Manufactory in New York, and our great variety of Telegraph Material in stock, fully establish our claim that our stores are the depots of telegraph supplies in this country.

**TARIFF BUREAU.****Semi-Monthly Circular.**

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York,  
DECEMBER 15, 1888.

To all Offices on W. U. Lines:

The following changes have occurred since December 1, the date of the last tariff order. Please note them in your tariff book:

**NEW OFFICES.**

Anita, Iowa, tariff same as Summit, Iowa.  
Cornwallis, West Va., re-opened, tariff same as heretofore.  
Forrest City, Mo., tariff 10c. more than to St. Joseph, Mo., from offices South and East thereof; and 10c. less than St. Joseph from offices North and West.  
Oxford, Iowa, tariff same as Marengo, Iowa.  
Potter Place, Andover, N. H., tariff same as W. Andover, N. H.  
Pulaski, Pa., tariff same as Sharon, Pa.  
Sherman, Wyo., tariff same as Cheyenne, Wyo.  
Sidney, Neb., tariff 1.85 more than to Omaha, Neb.  
Venice, Ill., tariff same as Alton, Ill.  
Washington, Wayne Co., Ind., re-opened, tariff same as heretofore.  
Winocook, Vt., tariff same as Burlington, Vt.

**OFFICES OPENED ON OTHER LINES.**

Greenland, Mich., tariff 85 and 8 more than to Houghton, Mich.  
Check Chicago, Ill.

Tarentum, Pa., tariff 70 and 5 from Philadelphia; 60 and 4 from Harrisburgh; 25 and 2 from Pittsburgh, checking by the cheapest route.

Pond Eddy, Pa., check to same point and at same tariff as for Ross, Pa.

Rockport, Ind., and Yelvington, Ky., tariff 75 and 5 from Louisville. Check Louisville.

**OFFICES CLOSED.**

Frankfort, Ky., Laclede, Wyo., Park, Col., Ross, Pa., Brandon, Miss., Summit, Iowa, and Tamaroa, Ill.

**GENERAL INFORMATION.**

Particular attention is called to the list of offices and tariffs of the Pennsylvania R. R., printed in the JOURNAL of June 1st. It is found that several offices are checking at other rates than those there given.

The rate for "additional words" on business of the Pennsylvania R. R. is the same as that adopted for Western Union offices, and printed in JOURNAL of October 1st.

In the tariff for Erie Railway District, printed in JOURNAL of October 1st, the rate to Alton and Bradford, Pa., should be 35 and 2 from Dunkirk, instead of 50 and 3 from Buffalo.

On and after Dec. 21st, all offices having "Special Sheet A" when computing tariff on business going to "Other Lines" will add their "special rate," to the point where the message leaves the Western Union lines, to the rate for "Other Lines," provided the "special rate" is not more than the old "through rate."

We are notified of the following amendments to Rules relating to Atlantic Cable Business, published in JOURNAL of February 15, Executive Order No. 58:

RULE 5.—In Government Cypher Messages plain dictionary words are to be accepted without counting the letters, and such words to be charged as single words. In other respects the provisions of this rule for counting groups of figures or letters remains unaltered.

RULE 8.—Prepaid Answers.—In cases where more than one reply is required and prepaid, the sender must state the number of replies thus: "Three replies paid."

WILLIAM ORTON, PRESIDENT.

**FREY'S SELF-CLOSING TELEGRAPH KEY.**

"A perfect, simple, homogenous, trunionless, self-closing key."—*Journal of the Telegraph.* By changing the points of the Receiving Magnet, the local batteries are kept from action, except when in actual use, and the sounder read in the usual manner. The Spring is made of the best spring wire; its elasticity adjustable. A perfect self-closer; the contacts are securely made, entirely independent of the manipulator. Right of manufacture for sale.

JOS. J. B. FREY, INVENTOR.

Box 4,820, New York City

**Married.**

At Columbus, Ky., October 7, Mr. Henry Stanbery, of Western Union office, Charleston, S.C., to Miss Barbara Worner, of former place.

**Died.**

In Duquoin, Ill., Mrs. Mary E., wife of Capt Wm. E. Norton, of Tamaroa, in the 26th year of her age. Mrs. N., formerly Miss Mary E. Alley, will be better known among the telegraph fraternity by the latter name.

AND EVERY DESCRIPTION OF TELEGRAPH SUPPLIES.

Offer the best guaranty of excellence in their profession—in their long established business—in the extent and variety of their manufacturing facilities—in the many improvements introduced by them, now almost universally adopted or imitated—and in the extent of their business, domestic and foreign, enabling them to keep pace with telegraphic progress.

They publish an Illustrated Descriptive Catalogue of their leading manufactures, to which they respectfully refer.

## AMERICAN COMPOUND TELEGRAPH WIRE.

SUPERIOR CONDUCTIVITY,

LIGHTNESS AND DURABILITY.

A MOST IMPORTANT INVENTION.

We would call the attention of Officers of Telegraph Companies, Telegraph Builders and Contractors, and the Public, to the new

PATENT COMPOUND TELEGRAPH LINE WIRE.

Manufactured by the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY,  
OF NEW YORK.

This Wire has already been put up on sections of several Telegraph Lines, and its merits fully tested, and the results show that it combines all the good qualities which are claimed for it, viz., *Economy, Superior Conductivity, and Increased Strength, with Decreased Weight of Metal.*

In its composition are used three metals, either of which is a good conductor, Steel, Copper and Tin; and the superiority of Copper as a conductor over other metals is well known, and but for its ductility rendering its permanent suspension in a pure state intact impracticable, it would have always been used exclusively as a Conductor on Telegraph Lines. By combining it with Steel the desired strength and permanence is attained, and the necessary weight of the line wires reduced two-thirds, thus obviating the necessity for using a large number of poles to the mile, and by reducing the points of contact, lessening the chances for trouble and escape of the electric fluid.

All other Line Wires must inevitably be superseded by this, and such Telegraph Companies as now adopt it will the sooner realize the advantages to be derived from its use over those whose lines are of the old rotten and rusty iron wire pattern.

STICKWELL & CO'S  
EXTRA MUCILAGE  
THICK, CLEAR AND ADHESIVE

Who has not used

STICKWELL'S MUCILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding "or any other man." It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOBS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, 8OZ. CONE, 8OZ. FLAT, 3OZ. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES.

Having adopted the use of

**OREIDE METAL,**

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed.

His Relays were awarded

**THE FIRST PREMIUM**

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them.

Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the *Helix*, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

**PRICES.**

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	18 00
Main Sounders same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by *Check* payable in New York, or *Post-office orders*, in which *check* will make no charge for package.

## THE MORSE BANQUET.

### Honors to the Inventor of the Magnetic Telegraph.

The grand complimentary dinner given to Professor Morse was in every sense a magnificent ovation, as it was a well-deserved tribute to that distinguished scientist. Some of the most eminent persons in the country were present to do him honor; the banquet was of the rarest and most exquisitely varied character; the speeches and general proceedings marked with supreme good sense and good feeling; and the entire entertainment one which will long live in the remembrance of those who assisted in it.

The banqueting-room was very beautifully decorated. A narrow drapery of crimson silk ran round under the cornice, beneath which were suspended the arms of those nations which have been most conspicuously ready to avail themselves of the benefit of telegraphy. At the back of the chairman's seat was a splendid medallion, bearing the arms of the United States, surmounted by the eagle; beside this were the arms of England and France, all united with the centre emblazoned in a grand trophy of flags.

The tables were splendidly adorned with curious pieces of confectionery of emblematical designs. In front of the chair was a large gilded statue of Atlas supporting the globe, around which were fixed telegraph poles, which, by light filaments of gold, were connected with the trophy above. Further down, on the central table, was a statuette of Franklin with the kite; and there were also symbolical pieces representing painting (in allusion to Professor Morse's former pursuits), a temple of merit, and a "Trophée aux inventeurs," which was extremely handsome. The carte bore a well-executed portrait of Professor Morse.

The Hon. Salmon P. Chase, Chief-Justice of the United States, presided on the occasion, having on his right the guest of the evening, Professor Morse, LL.D., and on his left Edward Thornton, Esq., H. B. M. Minister to the United States.

Among the guests were President Woolsey, Professor Goldwin Smith, Rev. Dr. Adams, Ex-Governor Buckingham, William E. Dodge, Amos Kendall, David Dudley Field, Hugh Allan (of Montreal), E. M. Archibald, Sidney E. Morse, James Brooks, President Barnard, William M. Evarts, Major-General Irwin McDowell, Edwards Pierrepont, Rev. Alexander Vinton, D. D., Governor Curtin, Wm. Cullen Bryant, A. B. Durand, Rev. Dr. Farley, Professor White, Wm. B. Reed, J. H. Wade, B. R. McAlpine, Gen. Anson Stager, Ezra Cornell, Gen. Lefferts, Cyrus W. Field, Wm. Orton, Peter Cooper, L. P. Morton, Wm. F. Blodgett, C. Van Santvoord, Clarence A. Seward, G. D. Phelps, Hiram Walbridge, Wilson G. Hunt, A. T. Stewart, Marshall O. Roberts, Moses H. Grinnell, Howard Potter, Clarkson N. Potter, H. H. Van Dyke, George Opdyke, Chas. Butler, Moses Taylor, A. A. Low, Abram Wakeman, J. J. Cisco, Samuel J. Tilden, Samuel B. Ruggles, Hamilton Fish, Erastus Brooks, C. L. Morse, R. Morse, C. Lanier, C. E. Detmold, E. L. Godkin, M. K. Jesup, Judge Kirtland, General Viele, S. L. M. Barlow, C. A. Rapallo, J. F. Kensett, Eastman Johnson, C. P. Cranch, Judge Erskine, &c. The total number of guests was about two hundred.

The invocation was uttered by Dr. Adams, as follows:

Almighty God, we adore Thee as the Maker of the heavens and the earth, and "whatsoever passeth through the paths of the seas." As Thou hast "made of one blood all nations of men for to dwell on all the face of the earth," we thank Thee for every discovery and art by which the community of human interests is aided and promoted; for the "swift ships" on the great and wide sea; for "chariots with flaming torches, which run like the lightnings;" and for the lightnings themselves which, at Thy bidding, come unto man and say, "Here we are." "Them that honor Thee, Thou wilt honor." Thanking Thee for the occasion on which we are gathered, we ask Thee to bless it for the promotion of all which is good, and the brighter anticipations of that day when, as "the lightning cometh out of the east and shineth even unto the west," the Son of Man shall come in the glory of that kingdom "which is righteousness and love and peace;" all of which we ask in the name of Jesus Christ, our Lord and Redeemer. Amen.

After justice had been done to the dinner, which fully equalled the promise implied in the adornment of the hall and tables, the Rev. Dr. Vinton returned thanks in a short prayer.

At this moment Mrs. and Miss Morse, Mrs. Dix, Mrs. Huntington and Mrs. and Miss Thornton and other ladies entered. The applause with which they were greeted perhaps may have been considered by them as some small compensation for the exclusion of their sex from the tables.

THE PRESIDENT, Chief-Justice Chase, said: And now, gentlemen, will you allow me what would be called in another place a word of "personal explanation." There is certainly nothing in my official position or in my official duties which would naturally suggest an invitation to me to preside upon this occasion; but the gentlemen who had charge of the arrangements remembered that in the earlier days of the telegraphic enterprise I was its sincere friend, and later had some personal connection with it. They, therefore, honored me with an invitation to be present and preside to-night.

The telegraph long since ceased to have need of friends and my personal connection with it terminated years ago. But my old interest in its progress has not abated. I remember the past as they do, and I would not be thought backward, whenever and wherever honors are to be paid to the father of American Telegraphy. [Cheers.] I accepted their invitation, therefore, and am here. [Applause.] And now if you receive this excuse as sufficient, and I take it you do, I will call on Mr. Cyrus W. Field for any letters he may have to read to us.

Mr. Field responded:

MR. CHAIRMAN AND GENTLEMEN—I well know how impatient you are to hear the distinguished gentlemen that are to address you this evening, and I will not detain you by reading the letters that we have received from the President of the United States; from Gen. Grant [applause]; from Speaker Colfax; from Admiral Farragut, and from many others of our most worthy citizens. But I will, as this is a banquet given to a distinguished electrician, read you two telegrams that we have received. The first is from the Governor of Massachusetts, the State in which Prof. Morse was born:

BOSTON, Mass., Dec. 29, 1868.

CYRUS W. FIELD and others, Committee for the Morse Banquet, Delmonico's:

I regret my inability to accept your invitation. Massachusetts honors her two sons—Franklin and Morse. [Loud applause.] The one conducted the lightning safely from the sky. The other conducts it beneath the ocean, from continent to continent. [Applause.] The one tamed the lightning; the other makes it minister to human wants and human progress.

ALEXANDER H. BULLOCK, Governor. [Applause.]

This morning I sent a telegram to London, giving information that we were to meet this evening to honor our fellow-citizen, Prof. Morse. The following reply was received at 50 minutes past noon to-day.

LONDON, 4 o'clock P. M., Dec. 29, 1868.

CYRUS W. FIELD, New York:

The members of the Joint Committee of the Anglo-American and Atlantic Telegraph Companies hear with pleasure of the banquet to be given this evening to Prof. Morse, and desire to greet that distinguished telegraphist, and wish him all the compliments of the season.

Sir Richard Glass is out of town.

Consols, 92½@92¾.

[Applause.]

J. C. DEANE, Secretary.

This telegram was sent from London at 4 o'clock this afternoon, and was delivered into the hands of your Committee at 12.50. [Applause and Laughter.]

THE PRESIDENT—You will please to prepare, gentlemen, for the first regular toast. It is in six words, which are never pronounced by patriotic Americans without honor, nor by intelligent men in any part of the civilized world without respect:

"The President of the United States."

[Cheers.] Music—Hail Columbia.

THE PRESIDENT—Americans can only repay in gratitude the numerous proofs of consideration, respect and of honor which, by various sovereigns and peoples of the Old World, have been bestowed upon the eminent citizen who is our guest to-night; but there is one sovereign and one people to whom our especial thanks are due. I mean the Queen, the great and good Queen of Great Britain [cheers—the company rising]. I mean the great and magnanimous English people. [Renewed applause and great enthusiasm.] Their men of science and their capitalists united with ours in furnishing what may be very well called the ways and means for laying the transatlantic cable, and British ships co-operated with American ships in the preparatory measures for the great enterprise. [Applause.] May they never meet in less friendly encounters. [Great cheers.] I will ask my friend upon my left, the British Minister, to respond to the next regular toast. [Three cheers for Mr. Thornton.]

"The Queen of the United Kingdom of Great Britain and Ireland, and all Sovereigns and Peoples who have testified their appreciation of the telegraphic inventions and enterprises of America."

Edward Thornton, Esq., C. B., British Minister to the United States, responded:

MR. THORNTON'S SPEECH.

Mr. Thornton said: MR. PRESIDENT AND GENTLEMEN—I thank you sincerely and most cordially for the kind manner in which the health of my beloved sovereign and of other sovereigns and peoples, who appreciate the telegraphic enterprises of the United States, has been proposed and responded to by the distinguished company here present. I hope I may be allowed to avail myself of this opportunity to express my great gratification at the sentiments of esteem and regard which I have observed are almost universally entertained for Her Majesty Queen Victoria [applause] by the press and people throughout the length and breadth of this great land. I am confident that there is no one in England who is more anxious than the Queen for the maintenance and improvement of the harmony and good understanding which ought to exist between the two nations—[applause]—and which are of such vital importance to both of them, and none who would rejoice so much that all honor should be done to so great a benefactor of the human race as the distinguished professor, to show our high appreciation of whose character we have assembled in this place.

I am unwilling, however, to fall into what seems to me the error of talking too much about peace. A good deal has been said upon the subject both in this country and in Europe, more perhaps than is either absolutely necessary or useful. [Applause.] Peace is not always produced by talking about it. Statesmen ought, I should imagine, to endeavor to discover what is most likely to engage men's interests, and to convince them that a state of peace is necessary to their well-being, and to their moral and material comfort. What can be more likely to effect this than a constant and complete intercourse between all nations and individuals in the world? [Applause.]

But statesmen are not always scientific men, and it is to science that we are indebted for the means of communication. Steam was the first olive branch offered to us by science. The voyage which my father made to this country in 1790 in 75 days is now easily accomplished in nine or ten. [Applause.] Then came a still more effective olive branch—this wonderful electric telegraph, which enables any man who happens to be within reach of a wire to communicate instantaneously with his fellow men all over the world. [Applause.]

Should I have the good fortune to live to the age of the venerable Professor I still hope to see some such improvements as will enable us to carry on a *face à face* conversation by means of the cable. [Laughter.] We shall then have merchants on this side of the water discussing their affairs with those of the other at so much a minute. We shall hear, perchance, of some love-stricken youth of London or Paris whispering soft nothings along the cable to one of those bewitching syrens of New York at so much an hour [laughter], she tempting him all the while to throw himself into the gulf which separates them.

[Laughter.] We shall then have statesmen, aye, and in those days of progress even stateswomen [laughter and applause] discussing international questions at so much a conference [laughter], and we poor diplomatists shall run a very good chance of being exploded altogether. [Laughter.] But I must not take up more of your time [cries of "Go on!"], which will be better employed by those friends and co-laborers of your distinguished guest, who are able and anxious, probably, to speak [laughter] to the high qualities which adorn him. I cannot, however, sit down without expressing my great satisfaction at being able, through the kind invitation I have received, to contribute my mite of that admiration and esteem for Prof. Morse which must be felt by all for so great a benefactor of his fellow creatures and of posterity. [Loud cheers].

THE PRESIDENT—The next regular toast is

"The Army and Navy of the United States;" [Music—Red, White and Blue. Three cheers for the army and navy.] United, thank God, never to be separated. We regret exceedingly the compelled absence of Admiral Farragut [cheers for Farragut], whom we expected to meet here this evening; but Major-Gen. McDowell will gratify the company by responding to the sentiment.

#### REMARKS OF GENERAL M'DOWELL.

MR. PRESIDENT AND GENTLEMEN: I am as deeply sensible of the honor of being called on to respond in behalf of the army and navy on this interesting occasion, as I am fully conscious of my inability to do either justice to the subject or to the eminently distinguished American in whose honor we are here present to-night. The army and navy have their lot and part in the matter of recognizing the good he has, through them, ever done mankind; for little as at first it may appear that war has to do with what was no doubt meant by the great discoverer, as especially and directly, for the purposes of peaceful life, yet I think I do not hazard too much in saying, that while it was, perhaps, neither his purpose, nor, perhaps, his desire, to add to the engine of war, he has certainly done so, in a most signal manner. Since the invention of gunpowder, and the development of all the many consequences to the human race which have flown from it, there are perhaps no three men who have contributed so much to the appliances of war as Fulton, Stephenson and Morse. [Cheers].

As the great end of modern civilized war is to reach a state of peace in the soonest possible time, any invention which facilitates or hastens military operations is a step in advance of the olden time, when war was the normal state of the human race. And of the modern additions to the means at the command of the admiral afloat and the general on land, the greatest, unquestionably, is the application of steam and electricity. The improvements in artillery and in arms of precision have altered the relations of attack and defense, and modified the conditions on which military operations are to be conducted. But manifold, interesting, and important as they are, they are not equal to the power now given of moving a whole army from one side of the continent to another in few days, and of sending for that army in a few seconds.

It is a fundamental condition of all human progress that man should have peace, and he who gives us the means of sooner bridging over the chasms of war, and making still shorter those, now happily, brief contests, which we do not seem to be able as yet to dispense with, is, in the highest sense, a benefactor to his kind. Therefore it is that they on whom specially devolve the charge of these contests are particularly called upon to pay and make their acknowledgments to one who has done so much to abridge their horrors. [Cheers.]

The next regular toast was:

"Our Guest—Prof. S. B. Morse—The man of Science, who explored the laws of Nature, wrested Electricity from her embrace, and made it a Missionary in the cause of human progress."

Before reading it Chief-Justice Chase spoke as follows:

#### REMARKS OF CHIEF-JUSTICE CHASE.

GENTLEMEN: You will now allow me to invite your attention to the next regular toast. God has given understanding to man, to be employed for His glory in promoting the happiness of His creatures. And in nothing that belongs to earth can the human understanding be more worthily employed than in the researches of Science and in the works of Invention.

Science and Invention may be called, perhaps not unfitted, the creators and the servants of civilization. Sometimes Invention, by a sort of intuition of principles, has grasped results and seemed to anticipate Science. More usually Science, by the patient investigation of truth, and the discovery of principles, has prepared the way for the triumph of Invention.

All Invention is realized Science. And this is especially true of the Telegraph.

I will not fatigue your attention with ancient and modern devices for communicating intelligence at a distance; but it seems proper to notice, here, how many men of science, and of what various nationalities, have contributed to that wonderful art and instrument, by which the world is now bound in electric chains.

Many shining names will at once occur to any one at all familiar with the history of the telegraph. Among them I can pause to mention only those of Volta, the Italian, to whose discoveries the battery is due; Oersted, the Dane, who first discovered the magnetic properties of the electric current; Ampere and Arago, the Frenchmen, who prosecuted still further and most successfully similar researches; then

Sturgeon, the Englishman, who may be said to have made the first electro magnet; next, and not least illustrious among these illustrious men, our countryman, Henry, who first showed the practicability of producing electro-magnetic effects by means of the galvanic current, at distances indefinitely great; and finally, Steinheil, the German, who, after the invention of the telegraph in all its material parts was complete, taught, in 1837, the use of the ground as a part of the circuit. These are some of those searchers for truth whose names will be long held in grateful memory, and not among the least of their titles to gratitude and remembrance will be the discoveries which contributed to the possibility of the modern telegraph.

But these discoveries only made the telegraph possible. They offered the brilliant opportunity: there was needed a man to bring into being the new art and the new interest to which they pointed. And it is the providential distinction and splendid honor of the eminent American who is our guest to-night that, happily prepared by previous acquirements and pursuits, he was quick to seize the opportunity and give to the world the first recording telegraph. Fortunate man! thus to link his name forever with the greatest wonder and the greatest benefit of the age! [Great applause.]

But his work was not done when in 1833 he conceived the idea and devised the plan of the first telegraph. Long years of patient labor and constant perseverance were needed to bring the telegraph into use. Its first messages were not transmitted until 1844. Even then, and indeed before that year, with something like prophetic inspiration, he grasped the future, and predicted that telegraphic connection between Europe and America, which it was reserved for another distinguished American, kindred in spirit and kindred in renown, and illustrious to accomplish. Here I must pause—not, however, without uniting all your aspirations in the fervent wish that our honored guest may live long and happily to enjoy the applause, the gratitude and the reverence of mankind which he has so honorably won. [Great applause.]

#### RESPONSE OF PROF. MORSE.

GENTLEMEN:

In rising to respond to the sentiment you have been pleased to put forth, I scarcely know in what terms to thank you, and I feel somewhat at a loss to determine in what manner adequately to answer your expectations in anything I may utter.

Various and conflicting memories crowd upon me at this moment—memories which this demonstration has quickened into life. What train of thought, what incidents of the past, in the brief moments allotted to me, can I select from this mass of recollections which may contribute either to your profit or your pleasure?

By this demonstration you have put me into the delicate position of telegraphic standard bearer, not merely for my own country but for the world, and yet this position, unsupported by certain well-acknowledged facts, might seem to savor of presumption. May I not, however, save myself from a charge of presumption, and you from a charge of national prejudice, if I fall back on the reiterated verdict of other nations?

Leaving out of view the personal honors awarded by so many of the Sovereigns of the Old World in conferring upon me the crosses of various orders of knighthood, and national scientific medals, let me refer to the Congress of the European Nations convened in Paris in 1858, at the suggestion of the Emperor of the French, the special object of which was to devise some "collective act of the nations," "testifying the sentiment of public gratitude" to me for my invention. Ten of the principal nations accepted the call, and by their ambassadors formed this congress. The result of their debates was a unanimous vote of four hundred thousand francs to be presented to me (using the language of their accomplished president, the late Count Walewski) "as an honorary gratuity and as a reward altogether personal for my useful labors"—"a collective token of the public gratitude justly excited by my invention."

In 1865 an International Convention was assembled in Paris, representing twenty nations, comprising nearly all if not all the nations of Europe. As one of the results of their deliberations, this convention decreed in its third article: "The apparatus Morse is provisionally adopted for the service of all the international lines."

Still more recently—in the spring of the present year—another International Telegraph Convention was assembled in Vienna, which has confirmed the previous decree and added another apparatus, an American modification of the telegraph, announcing that the Morse and the Hughes apparatus are adopted for the international lines.

These simple historical facts, I think, are sufficient to rescue both you and myself from any charge of presumption in claiming for the United States the position of having given to the world the modern telegraph.

In the minds of some, however, perhaps the question may be agitated: Whence and when did the telegraph, now universally adopted throughout the world, originate? Is it an invention originating here, or was it a foreign invention, first imported from abroad, receiving improvements on this side of the water, and then returned to the eastern continent? These questions, I think, can be satisfactorily solved. Let me premise that the instrumentalities for the purpose of inter-communication at a distance, which have been used from time immemorial, are naturally divided into *Semaphoric* and *Telegraphic*—the former, as its name indicates, conveying a signal, evanescent in its nature; the latter, as its name also indicates, permanently recording a sign. Although both these systems have been confounded under the general name of *Telegraph*, none are strictly telegraphic but those which propose and accomplish a permanent record. In considering the question of the paternity of modern telegraphy, therefore, this essential distinction should be borne in mind; and in claiming for my country the paternity of the telegraph, I, at the same time, disclaim the origination of any semaphoric system, except as the natural concomitant or result of the telegraph.

A proper observance of this distinction between the *semaphore* and the *telegraph* would long since have removed many of the causes of apparently conflicting claims to priority. For example: the English system, elaborated in 1836, and established in Great Britain in 1837, through the energy and skill of the ingenious Mr. Cooke, subsequently aided by Prof. Wheatstone, is a *semaphore*. Whatever its merits, however, as a *semaphore*, it is a fact universally acknowledged, as we have shown, by all the nations of the Eastern, as well as the Western Continent, that it has given place to the telegraph.

The telegraph has everywhere supplanted it, and this not only in the Continental nations, but extensively in the United Kingdom itself, and in all the British Colonies.

Whence then and when did the telegraph come into existence? I need not go into detail further than to recapitulate two or three essential dates, familiar indeed to all who have read any authentic history of the invention.

In 1832, on board an American ship in her voyage from Havre to New York, the *First Telegraph* was conceived, and its essential peculiarities brought forth and elaborated.

In 1835, according to the concurrent testimony of many witnesses, it lisped its first accents and automatically recorded them in this city a few blocks only distant from the spot from which I now address you. It was a feeble child indeed, ungainly in its dress, stammering in its speech; but it had then all the distinctive features and characteristics of its present manhood.

I need not trouble you with the maladies of its unfledged infancy, mainly the results of its parent's struggles against poverty, and the influence of the substantial incredulity of those who could have rescued it from its obscurity. It found a friend—an efficient friend—in Mr. Alfred Vail, of New Jersey, who, with his father and brother, furnished the

means to give the child a decent dress, preparatory to its visit to the seat of Government.

These few facts suffice here to indicate the time and place of the birth of the Telegraph.

In 1832 it was planned on board the ship. In 1835 its first operation was shown in the New York City University. In the winter of 1837 and 1838 it was presented before Congress. Whether the Telegraph had or had not in its composition anything in common with the so-called Telegraphs in Europe (but which were simply *electro-magnetic Semaphores*, and not *electro-magnetic Telegraphs*), it is evident from the dates that the American Telegraph could scarcely have derived anything from them, since these did not practically exist till some years subsequent to the conception and planning of the telegraph on board the ship; nor did the first English *electro-magnetic* semaphore exist until after the first practical operation of the American *electro-magnetic* telegraph in this city.

In claiming for the United States the birth place of the telegraph, do I claim too much? Am I unjust to the distinguished savans of the Old, and some also in the New World, whose patient labors and brilliant discoveries prepared the way for its advent? No one more sincerely appreciates than myself the scientific researches of Oersted, of Schweigger, of Ampere, of Arago, of Sturgeon, of Ohm, of Faraday, of Dana, and a host of distinguished workers in the mines of science, from out of every country—without whose labors, and the materials for combination which they furnished, the telegraph of the day would still have been unborn.

These labors and researches were equally necessary in making effective the *electro-magnetic semaphore*, which followed almost immediately after the brilliant magneto-electric discovery of the renowned Danish philosopher, Oersted.

To a distinguished savan of our own country it is also claimed belongs the discovery of a principle in galvanism which made practicable the *electro-magnetic semaphore*, and the *electro-magnetic telegraph* as well. However this may be, there are few in the country to whom science is more indebted for valuable labors and researches than Professor Henry, the eminent Secretary of the Smithsonian Institute.

Nations, from time immemorial, have claimed honor to themselves for giving to the world, through some of their subjects, valuable discoveries and inventions; and spirited, earnest, and even angry contentions have arisen to establish their respective claims to the invention or discovery in the person of some individual whom they put forth as the originator, and upon whom they concentrate their regard.

In this individualizing of inventions and discoveries there lurks a species of injustice not easy to avoid. It is rarely, if ever, that any invention is so independent of all others that a single individual can justly appropriate to himself the entire credit of all its parts.

It is only when the nature of invention is properly understood that the justice of the ascription of honor to the individual inventor is perceived. Invention is emphatically *combination*, an assembling or putting together things known, whether discoveries or other inventions, to produce a new effect, to create a *new art*.

But whither am I straying? Excuse me, gentlemen, I did not mean to go into the metaphysics of invention, especially before so many whom I see before me (our distinguished presiding officer among the rest) so much more able intelligently to discuss them.

I would briefly touch upon another subject growing out of the great and wide-spread extension of the telegraph.

I trust it will not be considered irrelevant to this occasion if I allude to the movement just now making in

Congress to attach the Telegraph to the Post Office Department.

I neither advocate nor oppose any particular measure to that end which Congress has thought proper to bring forward. I would simply allude to some historic facts, which it may be useful to remember in endeavoring to reach a just judgment in the matter.

It may have passed out of the memory of most of the present generation, that the idea of attaching the Telegraph to the Post Office Department was suggested in the very earliest stages of the invention. It was first broached in my correspondence with the Treasury Department more than thirty years ago—in 1837—but under very different circumstances from the present. I proposed in my letter of 27th September, 1837, to the Secretary the attachment of the Telegraph to the Post Office Department. The Secretary, the late Judge Woodbury, seconded the proposal in his letter of December 6, 1837, to the Speaker of the House. The proposition was repeated in my letter of February 15, 1838, to the Chairman of the House Committee of Commerce. It was again proposed by Hon. C. G. Ferris from the same committee, December 30, 1842, and a remark from his Report is worthy of quotation: "So inviting," he says, "are the prospects of profit to individual enterprise, that it is a matter of serious consideration whether the government should not on this account alone seize the present opportunity of securing to itself the regulation of a system which, if monopolized by a private company, might be used to the serious injury of the Post Office Department" (and please note his remark which follows), "*which could not be prevented without such an interference with the rights of the inventor and of the stockholders as could not be sustained by justice or by public opinion.*" The far-seeing mind of Mr. Ferris comprehended the future of the telegraph and in prophetic vision of just such a state of things as now exists (and this at a period in the History of the Telegraph before its practical test had been accomplished), he urged the Government to possess itself of the invention, when none of the difficulties could occur, which he foresaw must arise from interference with vested rights.

Why were these wise counsels of the Committee disregarded in that day? A brief narrative of certain events in the early history of the invention, when it was a suppliant for aid in the halls of Congress, will give the answer to this question. I must not detain you with too much detail, but the contrast of *then* and *now* cannot fail at least to amuse you.

The session of 1837 and 1838 passed away with no other action on the subject of the telegraph than a unanimously favorable report from the House Committee of Commerce. An interval of four (4) years occurred before the attention of Congress could be again roused to consider the matter. Senator Benton in the abridged debates, gives in brief, the kind of reception the bill for aid to test the telegraph met with in the House from certain members. As the narrative is very short, allow me to quote it:

"HOUSE OF REPRESENTATIVES,

"Feb. 21, 1843.

"*Electro and Animal Magnetism.*

"On motion of Mr. Kennedy, of Maryland, the Committee took up the bill to authorize a series of experiments to be made in order to test the merits of Morse's Electro Magnetic Telegraph. The bill appropriates \$30,000, to be expended under the direction of the Postmaster General.

"Mr. Cave Johnson wished to have a word to say upon this bill. As the present Congress had done much to encourage science, he did not wish to see the science of *Mesmerism* neglected and overlooked. He therefore proposed that one-half the appropriation be given to Mr. Fisk" (a gentleman at that time lectur-

ing in Washington on Mesmerism), "to enable him to carry on experiments as well as Prof. Morse.

"Mr. Houston thought that *Millerism* should also be included in the benefits of the appropriation.

Mr. Stanly said he should have no objection to the appropriation for Mesmeric experiments, provided the gentleman from Tennessee (Mr. Johnson) was the subject. [A laugh.]

"Mr. Cave Johnson said he should have no objections, provided the gentleman from North Carolina (Mr. Stanly) was the operator. [Great laughter.]

"Several gentlemen called for the reading of the amendment, and it was read by the Clerk as follows:

"Provided, that one-half of the said sum shall be appropriated for trying mesmeric experiments under the direction of the Secretary of the Treasury.

"Mr. Mason (of Ohio) rose to a question of order. He maintained that the amendment was not *bona fide*, and that such amendments were calculated to injure the character of the House. He appealed to the Chair to rule the amendment out of order.

"The Chairman said it was not for him to judge of the motives of members in offering amendments, and he could not, therefore, undertake to pronounce the amendment not *bona fide*. Objections might be raised to it on the ground that it was not sufficiently analogous in character to the bill under consideration; but in the opinion of the Chair it would require a scientific analysis to determine how far the magnetism of mesmerism was analogous to that to be employed in Telegraphs [laughter], he, therefore, ruled the amendment in order. On taking the vote the amendment was rejected—ayes 22, noes not counted. The bill was then laid aside to be reported."

The temper of the House is easily inferred from this narrative. To those who thus ridiculed the Telegraph, it was a chimera, a visionary dream like mesmerism, rather to be a matter of merriment than seriously entertained. Men of character, men of erudition, men who in ordinary affairs had foresight, were wholly unable to forecast the future of the Telegraph. I was told at the time by many personal friends in the House that the bill finally passed, more out of deference to my personal standing than from any just appreciation of the importance of the invention, a compliment which, however gratifying to personal pride, was fully offset by the low estimate it implied of the result of my labors. Other motions disparaging to the invention were made, such as propositions to appropriate part of the sum to a telegraph to the moon. The majority of Congress did not concur in this attempt to defeat the measure by ridicule, and the bill was passed—by the close vote, however, of 89 to 83. A change of 3 votes would have consigned the invention to oblivion. That this was not its fate is mainly due to the perseverance and foresight of the distinguished member from Maryland, Hon. J. P. Kennedy, and Hon. C. G. Ferris, of New York, and Hon. Col. Ayerigg of New Jersey, and Mason of Ohio. The struggles of the Telegraph before Congress were not ended with the passage of the Bill, to test its capacity between two distant cities. Another year witnessed the triumphant success of the test of its practicability.

The invention vindicated its character as a substantial reality. It was no longer a chimera, a visionary scheme to abstract money from the public coffers. Its inventor was no more subjected to the suspicion of lunacy, nor ridiculed in the Halls of Congress.

My earliest desires and intentions were that the Government should possess the control of such a power as I could not but foresee was inherent in the Telegraph.

Vast as its pecuniary value loomed up in the minds of some, in the contemplation of its future, I was neither dazzled with visions of untold wealth, nor

tempted to make an extortionate demand upon the Government for its possession.

Not merely had all my own property been expended on the invention, but large sums had been advanced by my associates, and these were items that entered into the calculations in my offer of sale. I had already intimated at various times my readiness to surrender the invention to the control of the Government. I engaged expressly "to enter into no arrangements to dispose of my rights as the inventor and patentee to any individuals or company of individuals *previous* to offering it to the Government for such a just and reasonable compensation as might be mutually agreed upon."

In conformity with this promise on my part, I offered the whole invention to the Government for the sum of (\$100,000) *one hundred thousand dollars*.

Strange as it may now seem, no response was made to this offer—no notice was taken of it except to request from the Postmaster-General a Report on the general subject of the Telegraph. The Hon. Cave Johnson, who had distinguished himself in ridiculing and opposing the Telegraph before Congress, held the office of Postmaster-General in 1845, and the experimental line between Washington and Baltimore, which belonged to the Government, was put under his control. Finding no disposition on the part of the Government to make any arrangement for controlling the whole invention, one half the time granted by the patent having expired, I was forced to look to other sources for the means of reimbursing myself for the expenditures incurred.

I obtained the services of the Hon. Amos Kendall, (at this allusion to Mr. Kendall there was a hearty cheer given throughout the room, which was continued until Mr. Kendall arose and acknowledged the compliment) through whose skill and experience as a former Postmaster-General, joint stock companies were formed to extend the lines eastward from Baltimore to New York, and westward from New York to Buffalo. Not willing to shut the door to negotiation with the Government for the possession of the invention, I caused a clause to be inserted in every contract, making provision to surrender the contract in favor of the Government on certain liberal conditions, provided arrangements for its purchase were concluded within a limited time—the 4th of March, 1847. The time expired, and nothing was done. The proposition was virtually killed by the Postmaster-General, who, in his report, although speaking of the invention as "an agent vastly superior to any other ever devised by the genius of man," yet adds, "The operation of the Telegraph between this city (Washington) and Baltimore, has not satisfied me that, *under any rate of postage that can be adopted, its revenues can be made to equal its expenditures.*" [Laughter.]

Such an opinion from this responsible and official source could not but operate disastrously upon Congress in regard to any proposition for the purchase of the invention. The influence of that opinion was felt beyond the walls of Congress. The Companies which had been formed for constructing the Telegraph from Baltimore to New York and from New York to Buffalo, in the belief that the *revenues* would at least equal the *expenditures*, were for the moment paralyzed, and but for the indomitable energy and faith of some of those men who early embarked their pecuniary means in the enterprise, the Telegraph might even now be looked upon as too expensive to be practical. If the sacrifices, the labors, the faith and pecuniary means of those who have borne the heat and burden of the day have demonstrated through thirty years of trial the pecuniary value of the Telegraph to be, not \$100,000, but many millions of dollars, should they not have the

credit and the profit due to their confidences and labors in the novel invention? If, therefore, in this age of telegraphic development the Government has at length appreciated the policy of possessing the Telegraph, and attaching it (as I originally proposed) to the Post Office Department, I will not doubt that a proper sense of justice will so far influence the proceedings of Congress on the subject, that neither the present owners of the Telegraph nor the public shall have just cause of complaint.

I have many thoughts that crowd upon me for utterance suggested by friendly faces at this board. I cannot but recognize here assembled all the living organizers of the New York, Newfoundland and London Telegraph Company—the forerunner and the harbinger of the Atlantic Telegraph—an enterprise, the consummation of which has justly conferred such honor on one of them present this evening, and to whom the two continents are so largely indebted, whose labors have been so gracefully and magnanimously acknowledged by the nations whom especially he has benefited. Titles and honors, well deserved, have been the meed of his eminent British associates; titles and honors, which, had he been a Briton born, would have been equally bestowed on him, yet the name of FIELD will need no prefix nor suffix to keep it in honorable remembrance in both hemispheres. [Applause.]

In casting my eyes around I am also most agreeably greeted by faces that carry me back in memory to the days of my art struggles in this city, the early days of the National Academy of Design.

Brothers (for you are yet brothers), if I left your ranks, you well know it cost me many a pang. I did not leave you until I saw you well established and entering on that career of prosperity due to your own just appreciation of the important duties belonging to your profession. You have an Institution which now holds and (if true to yourselves) will continue to hold a high position in the estimation of this appreciative community.

If I have stepped aside from Art to tread what seems another path, there is good precedent for it in the lives of Artists. Science and Art are not opposed. *Leonardo da Vinci* could find congenial relaxation in scientific researches and invention, and our own *Fulton* was a painter, whose scientific studies resulted in steam navigation. It may not be generally known that the important invention of the *percussion cap* is due to the scientific recreations of the English painter *Shaw*.

But I must not further detain you from more instructive speech. One word only, in closing.

I have claimed for America the origination of the Modern Telegraph System of the world. Impartial History I think will support that claim.

Do not misunderstand me as disparaging, or disregarding the labors and ingenious modifications of others in various countries, employed in the same field of invention. Gladly did time permit would I descant upon their great and varied merits.

Yet in tracing the birth and pedigree of the modern Telegraph, "American" is not the highest term of the series that connects the past with the present; there is at least one higher term, the highest of all, which cannot and must not be ignored.

If not a sparrow falls to the ground without a definite purpose in the plans of infinite wisdom, can the creation of an instrumentality, so vitally affecting the interests of the whole human race, have an origin less humble than the Father of every good and perfect gift? I am sure I have the sympathy of such an assembly as is here gathered, if in all humility and in the sincerity of a grateful heart, I use the words of inspiration in ascribing honor and

praise to him to whom first of all and most of all it is pre-eminently due. "Not unto us, not unto us, but to God be all the glory."

Not what hath man, but "*What hath God wrought!*"

Mr. Morse's address was listened to with deep attention and was greeted at the close with great and continued applause.

When the long-continued applause, which followed the conclusion of Professor Morse's response, had subsided, the President said:

Gentlemen, you will please give your attention to the next toast—

"The Nations United by a Common Literature."

We have with us to-night an eminent Englishman whose name is honorably identified with literature, and to whom our country is not a little indebted on various accounts. He can tell us best of what most nearly concerns the common benefit of mankind.

I beg to call on Professor Goldwin Smith.

SPEECH OF PROF. GOLDWIN SMITH.

Prof. Smith said: I rise, Mr. Chief-Justice, in obedience to your call, to respond to this great and pregnant sentiment, though I am most unworthy of the task, and most unworthy especially as regards that part of it which relates to the telegraph and to science, for I, unfortunately, can only afford to science the tribute of ignorant wonder and gratitude. [Applause.] In passing over the stormy Atlantic, I, like other unscientific persons, have thought with wonder of the skill and daring which fathomed those fathomless recesses, and mastered those unmastered waves. [Applause.] Like other unscientific persons, on landing in this country, three thousand miles away from England, I have felt deep gratitude to the science which still linked me to my English home. [Applause.] I hope and believe that it is no mere after-dinner sentiment, but a real and happy fact, that these increased facilities of communication do unite nations together, and tend to make good feeling predominate over those passions which might lead to war. [Cheers.]

I hope the same may be said of our common literature. We will not put the case too high. It is not to be supposed that when common humanity and common Christianity fail to keep in check the passions of men mere literary interests will succeed; but still it is reasonable to think that our common literary interests are among those complex forces which are gradually subduing the bad passions of nations; and which will in the end surely extinguish public as they have long ago extinguished private war. There have been, there still are, diplomatic questions between the two nations—questions which every right-minded Englishman hopes will, by the efforts of our Governments and of their representatives, be so solved that on the one side no stain may rest on the honor of England, and on the other every thorn may be plucked out of the heart of the American people. [Cheers.] But even while these questions are pending, the works of Motley, of Longfellow, and of Bryant [applause] lie on all English tables, and forbid any Englishman, any cultivated Englishman, at least, to harbor unkind thoughts of the American people; and in the same way, I suppose, the friendly American invaders of England, whom we see on our shores, can hardly entertain unkind feelings for the old country when they stand upon the grave of Shakespeare. [Applause.] I certainly have abundant reason gratefully to acknowledge that the republic of letters is a real thing, and that Americans as well as Englishmen own themselves its liegemen.

When I formed the intention of returning to America to prosecute the historical studies which in a very brief previous visit I had commenced, I was met not only with every sort of kindness and encouragement as a literary man, but with the offer which, in a slightly modified form, I gratefully accepted, of a connection with your new Cornell University. [Applause.] In that connection I have an object of deep interest, and, so far as my power extends, of usefulness. [Applause.] It would be presumption in me, upon so slight an acquaintance with the Cornell University, and with only an honorary connection, to attempt to speak of the character and prospects of the institution. This, however, I know, that there are hearts and brains engaged in it which will not easily let any enterprise fail. [Applause.] I am sure that an undertaking in which my friends, Mr. Cornell and President White are enlisted [applause], will not easily fall to the ground [applause]; and I feel sure that the students whom we have there are of good material; that whether outwardly polished or not, they have in them the root of the matter; that they are such students as a real friend of education likes best to address and to teach. [Applause.] They spring, many of them, I believe, from the farmer class, a class sound in morals and vigorous, and in this country uniting moral soundness and vigor with intelligence and aptness for learning. I trust that the institution will prosper. I trust that among other things it will rival the beneficence of the science which we are honoring to-night, by teaching the best methods of agricultural production—for after all, great and wonderful as telegraphs and steamships may be, agriculture is the foundation of our wealth.

I trust that in accordance with the wishes of its founders, the practical sciences will there be well taught, and that among the youth on whose intelligent faces it is my pleasure to look as a Professor—and behind which I doubt not

there are strong and aspiring hearts—there will be some who will hereafter emulate the fame of the illustrious guest of this evening, and receive, like him, the due meed of gratitude and reverence of a nation and of mankind. [Applause.] Some time ago, when I visited this country, then the scene of great and terrible events, which drew the hearts of my political friends in England very near to yours [applause], I was received with a kindness which was so little deserved by me personally, that I do not exaggerate when I say that it was even really painful to me. I have no wealth to requite that kindness, else would I gratefully bestow it. The best I have I will give. I will earnestly endeavor, so far as in me lies, to secure the success of the work with which I am connected [applause], and I hope that I may prove my gratitude by assisting an institution which I believe is in a fair way to become a blessing to this State and to the American nation. [Cheers.]

The President announced the next toast :

"The management of the telegraph—a great trust in the service of truth and as a bond of society—let it ever be so cherished and maintained"—and called upon the Hon. William M. Evarts to respond, jocosely remarking that the Attorney-General would illustrate the subject by a few sparks from "a hole in the sky."

SPEECH OF MR. EVARTS.
